There are frames in the Wiegman film and Zapruder film that convince me they were. In these frames, one can see what looks like a puff of smoke hovering in the trees. While one can easily see such things once one starts looking for them, and fool oneself, the fact is there are no other apparent puffs of smoke

in the Zapruder film besides the one seen in the reddish tree by the stockade fence as the limousine heads for the underpass. Furthermore, that there appears to be smoke in the trees in the Wiegman film, at exactly this same time, seems too great a coincidence.

Should one need further convincing, one should consider the words of Ed Johnson, a reporter riding in the motorcade press bus. In an 11-23-63 article in the Fort Worth Star Telegram, he wrote "Some of us saw little puffs of white smoke that seemed to hit the grassy area in the esplanade that divides Dallas' main downtown streets." (Source: history-matters.com)

Under the Overpass

John Dolan (12-18-63 FBI report, CD205 p.32) "he was stopped at the eastern edge of the triple viaduct...he got out of his car and stood at the base of the triple viaduct...the Presidential motorcade came into view and from where he stood he could hear three shots fired at the Presidential car...He advised he did not see where these shots came from." **Analysis: too vague.**

James Tague (12-16-63 FBI report, CD205 p31) "was stopped in traffic at the Triple Underpass...He stood near the curb of Main Street waiting for the motorcade...When the motorcade was approximately 100 feet from him he heard a loud noise, and at that time he looked around as he thought someone had shot a firecracker. He then heard two more loud noises in quick succession...During the time of the shooting he felt something hit him on the right cheek...He thought that possibly one of the bullets had hit the curb near his feet and possibly a piece of the curbing had hit him on the cheek... He did not see the shots take effect and stated he could not furnish any information as to where the shots actually came from." (Interview in the Dallas Times Herald, **6-5-64**) "There was that first shot, then the second and the third. Some time, I think it was the second shot, a bullet--I'm sure it was a bullet--hit the curb in front of me and I felt a sting on my cheek." (**7-23-64** testimony before the Warren Commission, 7H552-558) "I was standing there watching, and really I was watching to try to distinguish the President and his car. About this time I heard what sounded like a firecracker. Well, a very loud firecracker. It certainly didn't sound like a rifle shot. It was more of a loud cannon-type sound. I looked around to see who was throwing firecrackers or what was going on and I turned my head away from the motorcade and, of course, two more shots." (When asked if he saw the President hit) "I did not" (When asked which shot hit him) "maybe the second or third shot, I couldn't tell you definitely" (When asked if he heard any shots after he was hit) "I believe I did...I believe it was the second shot, so I heard the third shot afterwards. (When asked where he thought the shots came from) "my first impression was that up by the, whatever you call the monument...somebody was throwing firecrackers up there." (Interview in Rush to Judgment, filmed **March, 1966**) "Right after the presidential car had turned the corner, I heard these three loud noises...My first impression was that they had come from the left of us...somewhere towards the wooden fence." (First person account published in the National Enquirer, **4-7-68**) "One of the limousines made the sharp turn into Elm Street and fluttering hands from the curb identified it as the President's car. But my eyes never had a chance to seek out Kennedy. There was a loud report, a sharp sudden crackle of sound that seemed to linger in the air. A gunshot, I thought, but not necessarily from a rifle. It passed fleetingly in my mind that perhaps there was some disturbance in the crowd and an eager-beaver officer had fired a warning shot in the air. But the sound didn't seem exactly right for that. There had to be some other explanation. My gaze swept over the rows of faces on the distant curb. Then it darted on to the grassy slope, taking in the masonry which had spectators perching on it or leaning against it. Restlessly, I moved a step or two. One foot struck the metallic cover of a sewer manhole. Then there was a second blast, louder and even more distinct, as if from closer range. At that instant I was facing the gazebo. My attention was so caught up that I was only dimly aware of a stinging sensation in my right cheek. Then a third report followed quickly, not waiting--as the second one had--until the previous one died away...(Tague's summation) "The other wounded survivor of the Dealey Plaza shooting, Governor Connally, is reported to be satisfied with the one-

sniper theory. I am not." (Interview in The Men Who Killed Kennedy, broadcast **1988**) "When the first shot, which I thought was a firecracker, happened--then I heard two more--I ducked behind the triple underpass." (**1-19-92** interview with Gerald Posner, reported in Case Closed, 1993) (When asked which shot hit the curb) "I actually can't tell you which one. I could try to pick one, but through the years have maintained accuracy. I don't know which one hit me."

(Article by William Goggins available on the website of John McAdams, making repeated reference to a **5-6-97** interview with Tague) (On the first shot) "In an interview with the author, Tague explained that it was a "flat sound", whereas the other two were sharp "cracks" which sounded like a true rifle shot." (On what he did after the third shot) "He told the author he "did what anyone would do. I scanned the area to see what was going on" (On Posner's quoting him in Case Closed) "After personally interviewing James Tague, he made it aware to me that he was misquoted in Posner's book. Tague told me that it was not the first shot that caused his wound. He told the author in an interview that "something made me jump back behind the abutment, and that's why I think it was the second one (shot)." (No More Silence, p.109-115, published **1998**) "When I heard the first shot, I thought somebody had thrown a firecracker and was standing there wondering what had happened. Then I heard another sound which was a little different. The third shot sounded the same as the second...I could not honestly tell from where the shots had originated, but the first shot I found the most interesting." (**3-30-99** oral history for the Sixth Floor Museum) I was looking in the general direction toward the School Book Depository. The first noise had a firecracker sound, which I am one of many witnesses to that. It was a pop. I want to be very emphatic about that. I grew up on a farm. I've handled rifles, and I grew up with a rifle in my hands. I know what a rifle shot sounds like, and I know what a firecracker sounds like. The first shot was very clearly like the sound of a firecracker. My first thought was, "Oh, God, somebody is throwing firecrackers with the President going by." Then I heard the crack of a rifle, and it caught my attention and then the crack of another shot." (Truth Withheld, **2003**) "I stood there wondering what was going on when a limousine emerged from this crowd and headed down Elm Street toward where I was standing... My thoughts were quickly broken by the pop of a firecracker and I recall thinking "What kind of idiot would be setting off a firecracker with the President driving by?"... That thought was soon interrupted by the crack of a high-powered rifle shot, and then almost immediately the crack of a second high-powered rifle shot. It was then that something stung me in the face... One thing that I have always been positive of is that the first shot was not the shot that hit the curb near me... The first shot sounded like a firecracker." (Interview on Fox News Channel program JFK: Case Not Closed, broadcast **11-2003**) "I heard a pop. And my first thought was 'Who in the world is throwing a firecracker with the President driving by?' Then I heard the crack crack of two rifle shots." (Interview within **11-22-03** WBAP radio program found on Youtube) "I heard a firecracker go off. What kind of fool is throwing firecrackers when the President's driving by." (Interview on Nightflight radio, **11-18-09**) "I heard what I thought was the pop of a firecracker and the thought went through my mind 'What kind of an idiot would be throwing firecrackers with the president going by'... Then there was a delay. It were about three seconds, and then the crack-crack of two rifle shots... one right after the other. (When asked if he could tell from where the shots had been fired) "Not really. From where I stood, the line of fire--it could have been from anywhere--the Dal-Tex Building, the school book depository, or the grassy, it could have been any one of the three... (When asked if it could have come from his right) "No there wasn't anything coming from my right. It was all straight ahead and to the left." (Interview in JFK: The Lost Bullet, broadcast **11-20-11**) "So somebody throws a firecracker. I thought. It turned out it was the first shot. There's a pause, and then the crack-crack of two rifle shots. After the third shot, I ducked back behind the concrete for protection." (**11-22-11** e-mail from Tague posted by Jim Pomerville on the JFK Assassination Forum website, 12-2-11) (On Max Holland's theory the first shot missed more than six full seconds before the second shot, and was the bullet causing the wound on Tague's cheek--the theory tested in JFK: The Lost Bullet) "Holland is

full of crap. One thing I know for sure is that the first shot was not the missed curb shot. Another thing I am positive about is that the last shot was the missed shot. You may not want to believe the Warren Commission's final findings, but you can believe the 11 witnesses who state it was the last shot that missed. Only one witness thought it was the first shot that missed, that was Virgie Rachley... "

Analysis: Tague's statements that the second and third shots came in quick succession are in opposition to the currently-popular scenario. Since Tague initially believed he was hit by the second shot, and since he was standing in line with a shot fired from the sniper's nest at the moment of the head shot, his statements are also consistent with his being hit by a fragment of the head shot bullet. In his book, *Truth Withheld*, he concludes that yes indeed he was hit by the second shot. **First shot hit 190-224. Last two shots bunched together.**

Up Close and Personal

Above: Z-345, with, from L to R, Richard Bothun (with camera), James Altgens (with camera) and Malcolm Summers (diving to the ground).

Above: a frame from the Muchmore film, showing Emmett Hudson and two unidentified witnesses standing on the steps.

Above: the Willis photo, with Abraham Zapruder and Marilyn Sitzman on the pedestal behind the Stemmons sign

Up Close and Personal

In this section we will meet some of the closest bystanders to witness Kennedy's assassination. We will work our way east from those closest the railroad bridge, occasionally jumping from the south to the north side of the street and then back again.

Jack Franzen, his wife, and son, can be seen in the Zapruder film on the south side of Elm as the limousine races for the underpass. (11-24-63 FBI report, 22H840) "He said he heard the sound of an explosion which appeared to him to come from the President's car and noticed small fragments flying inside the car and immediately assumed someone had tossed a firecracker inside the automobile. He

heard a second and third and possibly a fourth explosion and recognized these sounds as shots fired from some firearm. At the same time he noticed blood appearing on the top and sides of the head of President Kennedy.” (Family interview recorded **6-18-97** available online) “so we walked on down to the grassy area, just short of the triple underpass... We had a ball and Jeff and I were tossing the ball back and forth and a few people came along... and we moved further west down the hill. Right across from a little people station or something there on the north side of Elm. And, sure enough, you could then start hearing some noise to our east and directly, the cars came down Main... About that time, the Presidential car was turning the corner right there at the School Book Depository, and almost came to a stop as it turned the corner... and about that time there were two explosions. They sounded like fireworks and - to my memory - there were some kind of feathers or confetti or something, uh, stirred around the car. The limousine driver and the guy in the front seat almost - momentarily - stopped the car and he turned his head and everything was alright, so he turned back and proceeded to come on down toward us. The car was moving very slowly. Then there was another explosion - seemed to me like it was maybe 200 feet from the corner. And it didn’t register, exactly. But the car kept coming and picking up a little speed. Then, we were right there at the car - maybe 25 feet from it. Connally appeared to be bending over - in retrospect, he’d probably been hit. Nell was looking at him. At just about that time, another explosion and, you could just see Kennedy’s head - his forehead - literally explode. Whatever hit him, I would feel, hit from the back...for his blood and brain matter went forward. His body went forward...and to his left. And he was sitting on Jackie’s right. As it went forward and to the left, there was a lot of gore and he kind of fell over onto Jackie and she jumped up. Almost got her knees or feet on the seat rather than on the floor; about that same instant the driver turned his head around and saw that Kennedy was a mess.” **Analysis:** since the confetti shot would seem to be the head shot, Franzen’s earliest statements would indicate he heard the head shot first, and multiple shots afterwards. It seems likely from this he actually heard the last two shots bunched together and then echoes, much as Sam Holland and Royce Skelton. Franzen’s more recent statements are even more confusing. Now he remembers the confetti shot *and* a head shot. He remembers Greer stopping after the confetti shot but then continuing to drive slowly because everything was “alright.” **Did not hear an early shot. Last two (or more) shots bunched together (with the last shot after the head shot).**

Mrs. Jack Franzen (11-25-63 FBI report, 24H525) “She advised shortly after the President’s automobile passed by on Elm Street near where she and her family were standing, she heard a noise which sounded to her to as if someone had thrown a firecracker into the President’s automobile. She advised at approximately the same time she noticed dust or small pieces of debris flying from the President’s automobile. She advised she heard two other sounds which sounded like shots from a firearm and noticed blood appearing on the side of President Kennedy’s head...She advised the President’s automobile continued on down Elm Street at a higher rate of speed.” (**12-11-63** Airtel from Dallas FBI as a response to a Bureau Airtel of 12-6--apparently they sought some clarification--FBI Headquarters File 102-82555, Sec 27, p41) "She recalled hearing the shots, thinking at the time that the first was a firecracker, and noticed blood appear on the side of the President's head...She recalled that after the President's car sped away, she observed police officers and plain-clothes men searching an area adjacent to the TSBD Building and assumed the shots came from that area." **Analysis:** Mrs. Franzen confirms her husband’s initial impression. As the Franzens did not comment on the explosion of Kennedy’s skull, only “blood appearing on the side” of his head, it should be clear the confetti shot was the head shot. **Did not hear an early shot. Last two (or more) shots bunched together (with the last shot after the head shot).**

Jeff Franzen (December 1999 BBC interview) “You could hear the noise of the crowd start to reach a little more of a crescendo, and it was obvious something was getting closer. So we all stopped and my mother and father and I came close to the street. And you could actually see one of the first cars of the

parade and the motorcycle policemen come around the corner. And then the main limousine, carrying the President and the then Governor of Texas, John Connolly, came also right in front of us, coming down the street from our right. As they started coming down the hill, they slowed a little bit. And you could hear a loud pop, which to me at the time sounded like firecrackers. Being a young child, I felt like it was just part of the parade and fireworks and confetti. And then it proceeded - the car came even closer to us, which was by then maybe less than ten to fifteen yards away. And there was another pop of firecrackers. And this one - there was a great deal of what I thought at the time was confetti, just exploding from the car. I subsequently learnt, much later, that this was obviously President Kennedy being shot, and the confetti was actually his head - the front of his skull and the brains, in retrospect, going up into the air....After the explosion, the President's wife - she was dressed in a very bright pink dress, and she had a lot of red roses in her lap, too; which was also confusing, because it was a mixture of the President and the blood and all the mess and then her pink dress and the flowers - she immediately panicked. And at that point she jumped up and tried to climb out of the back of the vehicle, when a secret serviceman came running from the vehicle right behind. And he just barely jumped on the car as the driver was accelerating, and was able to push Jacqueline Kennedy back into the seat.” **Analysis:** young Jeff was only six years old when he witnessed the President of the United States get his brains blown out. It seems possible from this fact that his parents went into a bit of denial on the issue and tried to convince themselves that what they saw that day was confetti. While he only mentions two pops of gunfire, he describes them as firecrackers, which could indicate more than one shot. Even so his recollection of only one shot before the head shot or shots argues against a shot as early as-160. **Only heard two shots? First shot 190-224.**

Malcolm Summers can be seen diving to the ground in Zapruder frame 345. (**11-23-63** statement to Dallas Sheriff’s Department, 19H500) “The President’s car had just come up in front of me when I heard a shot and saw the President slump down in the car and heard Mrs. Kennedy say, “Oh, no,” then a second shot and then I hit the ground as I realized these were shots. Then all of the people started running up the terrace away from the President’s car and I got up and started running also, not realizing what had happened. In just a few moments the president’s car sped off.” (Interview in TV special *Who Murdered JFK?*, first broadcast **11-2-88**) (on the aftermath) "I ran across the Elm Street to run up there toward that knoll, yessir, and we were stopped by a man in a suit and he had an overcoat over his arm. And he, I saw a gun under that overcoat. And his comment was 'Don't y'all come up here any further, you could get shot, or killed,' one of those words...A few months later they told me they didn't have an FBI man in that area. If they didn't have anybody, it's a good question who that was." (PBS program *Who Shot President Kennedy?*, first broadcast **11-15-88**) "I do think the first shot came from the school book depository up there. And when the second one came I did not know who all was shooting. I was thinking there was more than one person shooting. The first shot sounded just like a little pop. It sounded like a firecracker from a far away distance. The others sounded real close, real close." (**11-16-91** AP article on an assassination conference found in the *Victoria Advocate*) "Malcolm Summers said he was standing so near the presidential limousine when Kennedy was hit that he heard Mrs. Kennedy cry out "Oh, my God, no! They're going to kill us all!" Summers said the second and third shots were fired so close together that "I certainly thought more than one person was shooting." (No More Silence p.102-107, published **1998**) “The first shot I heard was just after they had immediately turned the corner headed west on Elm Street. The first reaction that I saw when that first shot was fired was the Secret Service men kind of looking around and down at the people. I was of the impression that someone had thrown a firecracker...As a result my attention was diverted away from looking at Kennedy, and I didn’t see him reach for his throat. But then it was such a short time that the other shot was fired, then you knew that it wasn’t anything like that. Then the third shot came right after that also. I heard three shots altogether...Then, when Jackie reached over and grabbed John, she was saying, “Oh, no! Oh, God no!” or something to that effect...Then I knew immediately that he had been hit...I

thought he might have been ducking...When I heard her say that was after the second one had already hit. Apparently, that was the head wound....as to the spacing of the shots, there was much more time between the first one and the second two, the second and the third. They were real close.” (11-23-98 article in the Ft. Worth Star-Telegram) "Dallas resident Malcolm Summers, 74, said he got down on the ground after he heard the shots ring out. 'When that cop came off that bike, I hit the ground,' he said"

(Oral History for the Sixth Floor Museum, 3-7-2002) "Well, they came around and then the first thing I heard was, I thought, was a firecracker, the first shot...The FBI and the Secret Service people that was on the back of that car they looked down at the ground...I think they thought it was a firecracker, also, and I've always maintained this, and then I thought in my mind, well, what a heck of a joke, you know, to be playing like that. Well, then the car kept coming, and then the second shot rang out. And then the third was just about where I was at, rang out. And the first shot and the second shot was fairly close. And then the second and third was likewise. There wasn't much difference in any of the timing there. And course, I was standing beside the curb there. I saw Kennedy get hit. I heard Connally say, "They're going to kill us all!" or "shoot us all." I'm not sure which one on that is. And then, I heard Jackie Kennedy scream out, "Oh, God! No, no, no!" And there was a shrill--It was very sad to hear that." (When asked the number and timing of the shots) "I heard three shots...I'm certain...I'd say the first one was like a firecracker...The second one and third one were the closest together of all...When Connally said "they're gonna shoot us all" or "kill us all," well, that's when I thought there was more than one person involved for sure. Because he said 'they.' And certainly it sounded like 'they' with that many shots." (When asked to knock out the pattern of the shots on the table) Knock.....knock...knock. (He waits two seconds or more before knocking the second shot, and less than one second for the third.) (When asked if he knew from where the shots had been fired) "No. I had no idea." (When asked this again) "No, I certainly didn't." (From an 11-22-2003 WBAP radio program posted on Youtube) "I thought someone had threw a firecracker down on the ground, just to be smart. But then the procession kept coming. And then the second and the third shot rang out. Well, I knew it was being shot at...The car got to right beside me where I was at. And it actually stopped momentarily. And I heard Jackie Kennedy 'Oh God, no, no.' And I heard John Connally say 'They're going to shoot us all.'" **Analysis:** Summers heard an early shot and thought nothing of it, then witnessed the head shot, followed by a third shot. He seconds Royce Skelton's statement that Jackie yelled out before the third shot was fired. (She is seen yelling out between frames 325 and 338 on the Zapruder film). As he can be seen hitting the ground in the Zapruder film around frame 345, his statement that he hit the ground just after the last shot, helps us place the time of this shot. (Apparently, it rang out while Jackie was still yelling.) By stating that the Secret Service agents were looking around after the first shot, and that the second shot was the head shot, he confirms a first shot hit. **First shot hit 190-224. Last two shots bunched together (with the last shot after the head shot).**

James Altgens can be seen in Zapruder frame 345 just to the east of Malcolm Summers. (11-22-63 eyewitness account, presented as an AP dispatch and published in Cover-Up) "There was a burst of noise - the second one I heard - and pieces of flesh appeared to fly from President Kennedy's car. Blood covered the whole left side of his head. Mrs. Kennedy saw what had happened to her husband. She grabbed him exclaiming, "Oh, No!". The car's driver realized what had happened and almost as if by reflex speeded up towards the Stemmons Expressway. There seemed to be utter confusion. One motorcycle officer ran his cycle into the curb, almost falling off. Police came from everywhere as the President's car disappeared from sight. At first I thought the shots came from the opposite side of the street. I ran over there to see if I could get some pictures. But it turned out to be just more confusion. Police ran in all directions in search of the assassin. I did not know until later where the shots came from. I was on the opposite side of the President's car from the gunman. He might have hit me. The motorcade was moving along in routine fashion until there was a noise like fireworks popping. I snapped a picture of the motorcade at just about that time, still unaware of what was happening. I

cranked my camera for another shot. The procession still moved along slowly. Then came the second burst of noise." (11-22-63 AP report preceding the announcement of Kennedy's death and found in the Frederick Maryland News) "AP Photographer James W. Altgens said he saw blood on the President's head. Altgens said he heard two shots but thought someone was shooting fireworks until he saw the blood on the President. Altgens said he saw no one with a gun." (11-22-63 news bulletin on WBAP, shortly after the AP report) "The Associated Press reports from Dallas that President Kennedy was shot today just as his motorcade left the downtown section. Mrs. Kennedy is said to have jumped up and grabbed her husband and cried "Oh, no!" as the motorcade sped off. Photographer J.W. Altgens of the Associated Press said that he saw blood on the President's head. The photographer said he heard two shots but thought someone was shooting fireworks until he saw the blood on the President. He said he saw no one with a gun." (11-22-63 announcement on WFAA that the President had been shot) "An Associated Press photographer, James Altgens...reports he saw blood on the President's head. The AP man said he heard two shots but that he thought someone was shooting fireworks until he saw blood on the President." (5-24-64 article in the New York Herald-Tribune) "I was about 30 feet in front of the President's limousine on Mrs. Kennedy's side. I remember hearing what I thought was a firecracker at the instant I snapped the picture. I was going to make another picture, the one I was really set up for, when I realized what had happened and I froze, aghast." (6-5-64 FBI report, CD 1088 p.1-6) "at about the instant he snapped the picture, he heard a burst of noise which he thought was firecrackers... he does not know how many of these reports he heard...After taking the above photograph...he heard another report which he recognized as a gunshot. He said the bullet struck President Kennedy on the right side of his head and the impact knocked the President forward. Altgens stated pieces of flesh, blood, and bones appeared to fly from the right side of the President's head and pass in front of Mrs. Kennedy to the left of the Presidential limousine. Altgens stated Mrs. Kennedy grabbed the President and Altgens heard her exclaim "Oh, no!" as the president slumped into her lap. Altgens said he also observed blood on the left side of the President's head and face."

(7-22-64 testimony before the Warren Commission, 7H517-525) "I made one picture at the time I heard a noise that sounded like a firecracker—I did not know it was a shot, but evidently my picture, as I recall, and it was almost simultaneously with the shot—the shot was just a fraction ahead of my picture, but that much—of course—at that time I figured it was nothing more than a firecracker, because from my position down here the sound was not of such volume that it would indicate to me it was a high velocity rifle...it sounded like it was coming up from behind the car from my position—I mean the first shot, and being fireworks—who counts fireworks explosions? I wasn't keeping track of the number of pops that took place, but I could vouch for number 1 and I can vouch for the last shot, but I can not tell you how many shots were in between. There was not another shot after the President was struck in the head. That was the last shot--that much I will say with a great degree of certainty." (When asked how he could be certain it was the last shot) "Because, having heard these shots and then having seen the damage that was done on this shot to the President's head, I was aware at that time that shooting was taking place and there was not a shot--I looked--I looked because I knew the shot had to come from either over here, if it were close range, or had to come from a high-powered rifle." (When asked where he meant by "over here") "The left side of the car." (When asked if that meant the little street running in front of the school book depository, the Elm Street extension, presumably behind the knoll) "Somewhere in that direction, yes, sir. But if it were a pistol it would have to be fired at close range for any degree of accuracy and there was no one in that area that I could see with any firearms, so I looked back up in this area." (When asked if "this area" meant the buildings at Houston and Elm, including the depository.) "Yes. What made me almost certain that the shot came from behind was because at the time I was looking at the President, just as he was struck, it caused him to move a bit forward. He seemed as if at the time----well, he was in a position-- sort of immobile. He wasn't upright. He was at an angle but when it hit him, it seemed to have just lodged--it seemed as if he were hung up

on a seat button or something like that. It knocked him just enough forward that he came right on down. There was flesh particles that flew out of the side of his head in my direction from where I was standing, so much so that it indicated to me that the shot came out of the left side of his head. Also, the fact that his head was covered with blood, the hairline included, on the left side all the way down, with no blood on his forehead or face--- suggested to me, too, that the shot came from the opposite side, meaning in the direction of this Depository Building, but at no time did I know for certain where the shot came from." (On the head shot) "up to that time I didn't know that the President had been shot previously. I still thought up until that time that all I heard was fireworks and that they were giving some sort of celebration to the President by popping these fireworks. It stunned me so at what I saw that I failed to do my duty and make the picture I was hoping to make. The car never did stop. It was proceeding along in a slow pace and I stepped out in the curb area and made another picture as the Secret Service man stepped upon the rear step of the Presidential car and went to Mrs. Kennedy's aid and then after that I immediately crossed the street and once again I was looking to see if I could find anything in this area of Elm and Houston Streets that would suggest to me where the shot came from. Moreover, I was interested in knowing whether or not somebody else had been struck by a bullet or one of the bullets in this area. I saw that no one else had been hit."

(Interview with CBS broadcast **6-26-67**) "As I was getting ready to make some pictures why I heard this noise-- I thought it was a firecracker explosion—but I just went ahead and made the picture which shows the President right after he was struck by a bullet, struck in the neck, the first shot, and this was the picture that the Warren Report later fixed as being made two seconds after the shot was fired. And as they got in close to me, I was prepared to make the picture—I had my camera about at eye level—that's when the President was shot in the head. And I do know that the President was still in an upright position, tilted, favoring Mrs. Kennedy. And at the time that he was struck by this blow to the head, it was so obvious that it came from behind. It had to come from behind because it caused him to bolt forward, dislodging him from this depression in the seat cushion, and already favoring Mrs. Kennedy, he automatically fell in that direction." (Interview presented as part of radio show *Thou Shalt Not Kill*, on Canadian radio station CTFR. broadcast **5-10-76**. Transcript provided by Randy Owen on the JFK Lancer Forum, 6-29-10) "I was watching the President and was prepared to make a picture of he and Jackie Kennedy, a good, closeup, smiling picture of them. At the time, Jackie was looking at me and John Kennedy was almost staring straight ahead--no expression, no smile, hardly any emotion showing at all--and just as I raised my camera to go ahead and make the picture anyway, although he wasn't looking at me, well then, that's when he received the shot in the head and this disturbed me so much I just stood there looking at the whole operation... The caravan never did stop, but if it ever came close to stopping it was right at that point. And as I turned and made the picture of the Secret Service man going up to help Jackie back into the limousine, I heard someone on the radio say, "We've been hit. Get us to the nearest hospital quick." And that's when they threw into high gear and took off. (No More Silence, p.41-59, published **1998**) "I only recall the President hit once that I can vouch for because that first camera shot... made any definite conclusion uncertain. But this particular one where he was hit, the head shot, was obvious to everyone that it was a shooting, not fireworks. I don't know how many shots there were. If I were guessing, I would figure that was probably the third shot. In other words, he was hit when I was taking the picture, and the fatal shot should have been somewhere around the third shot, and that should have been the last... The tissue, perhaps bone, a lot of fragments, all came my way... But the majority of the mass that was coming from his head came directly like a straight shot out my way on to the left in a straight line. When he fell over into her lap, the blood was on the left side of his face. There was no blood on the right hand side which suggested to me that the wound was more to the left than it was to the right." **Analysis:** Altgens heard only two bunches of shots, one which occurred just before his photograph taken at Z-255, and the head shot, and yet he seems to recall other shots, just not when he heard them. While his words have been used to show there was no shot from the knoll, his

initial impression was, apparently, that sounds had come from that direction. As far as Altgens' latter-day statements that the blood was on Kennedy's *left* side, it seems probable he was confused by his facing Kennedy, whereby his left hand corresponded to Kennedy's right side. **Only heard two definite shots. First shot hit 190-224.**

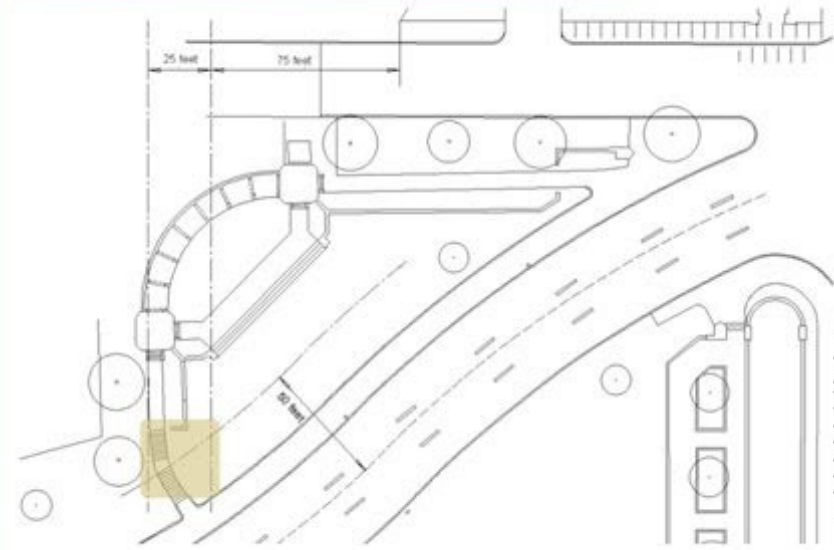

Richard O. Bothun is the photographer just east of Altgens in Zapruder frame 345. (Pictures of the Pain, p.155, Trask interview with Mrs. Jan Bothun, **11-26-84**) "Mrs. Bothun recalled that her husband was very shocked at the sight of the President being hit in the head and that he had been close enough to hear Mrs. Kennedy "holler." **Analysis: too vague.**

His Name is Mudd

The statements and testimony of Emmett Hudson (in the white cap) and F. Lee Mudd suggest that Mudd was the previously unidentified man in the red shirt seen in the Muchmore Film (L and R), Nix Film (middle R), and Bond photo (bottom R).

At left: a map made by Martin Hinrichs showing Mudd's presumed location by the steps.

His Name is Mudd

Emmett Hudson stood on the steps on the North side of Elm with two still-unidentified men. He can be seen in the Muchmore film. References to the other men standing beside him are in italics. (**11-22-63** statement to Dallas Sheriff's Department, 19H481) "This day I was sitting on the front steps of the slopping [sic] area and about half way down the steps. *There was another man sitting there with me. He was sitting on my left and we were both facing the street with our backs to the railroad yards and*

the brick building. At the same time the President's car was directly in front of us, I heard a shot and I saw the President fall over in the seat. *I do not know who this other man was that was sitting beside me. In our conversation he talked about having a hard time finding a place to park. He also talked about working somewhere over on Industrial Blvd. This man said Lay down and we did. I definately [sic] heard 3 shots. The shots that I heard definately [sic] came from behind and above me. When I laid down on the ground I laid on my right side and my view was still toward the street where the President's car had passed. I did look around but I did not see any firearms at all. This shot sounded to me like a high powered rifle."* (11-26-63 FBI report, CD5 p.30-31) "Emmett Joseph Hudson...called attention to a photograph...by Mrs. Mary Moorman...which photograph showed the President in a slumping condition immediately following the impact of the shots. Hudson called attention to a group of three men in the photograph standing on some concrete steps north of Elm Street and north of the position of the presidential car in the photograph. He pointed to the man in the middle of this group of three individuals in the photograph and advised 'That is me in the light colored clothing and that is where I was standing when the President was shot.' He said he was looking directly at President Kennedy and saw his head slump to one side simultaneously with the loud report made by the first shot fired by the assassin. He said he then heard two more reports which sounded like shots, such reports coming in rapid succession after the first shot. He volunteered the shots were fired 'just about as fast as you could expect a man to operate a bolt action rifle' or words to that effect. Hudson said the shots sounded as if they were fired over his head and from some position to the left of where he was standing. In other words, the shots sounded as if they were fired by someone at a position which was behind him, which was above him, and which was to his left. He again called attention to the photograph referred to above, and particularly to the corner of the Texas School Book Depository building appearing in such photograph and said the shots sounded as if they were coming from that building (Texas School Book Depository Building). Hudson stated when he heard the shots, he turned around and looked in the general direction of the Texas School Book Depository Building, 411 Elm Street, Dallas, Texas; however, he did not see anyone with a rifle or firearm of any kind. He pointed out, however, it was a matter of two or three seconds after he heard the shots before he focused his vision on the Texas School Book Depository Building and perhaps in that small lapse of time the assassin had stepped back from the window. Hudson estimated he was approximately thirty feet from the Presidential car at the time he heard the shots and immediately noticed the President's head slump to one side. *He advised he did not know the identity or address of either one of the other two men referred to above in the three man group in the photograph. He said the only statement he remembered either one of these two men made was that one of the men stated that he worked somewhere over on Industrial Boulevard in Dallas, Texas."*

(7-22-64 testimony before the Warren Commission, 7H558-565) "*Well there was a young fellow, oh, I would judge his age about in his late twenties. He said he had been looking for a place to park and he walked up there and he said he finally just taken a place over there in one of them parking lots, and he come on down there and said he worked over there on Industrial and me and him both just sat there first on those steps.* When the motorcade turned off of Houston onto Elm, we got up and stood up, me and him both. He was on the left side and I was on the right and so the first shot rung out and, of course, I didn't realize it was a shot, what was taking place right at that present time, and when the second one rung out, the motorcade had got further on down Elm and you see, I was trying to get a good look at President Kennedy. I happened to be looking right at him when that bullet hit him, the second shot...it looked like it hit him somewhere along a little bit behind the ear and a little bit above the ear. (When asked where the car was when he heard the first shot) "I remember it was right along about this light post here" (indicating the first light post). (When asked if he heard three shots) "Yes, sir." (When asked if he was sure the second shot hit Kennedy in the head) "Yes, I do believe it was—I know it was." (When asked what happened during the third shot) "*the young fellow that was sitting*

there with me—standing there with me at the present time, he says 'Lay down , Mister, somebody is shooting at the President.' He says, 'Lay down, lay down.' and he kept repeating, 'Lay down.' so he was already laying down one way on the sidewalk, so I just laid down over on the ground and resting my arm on the ground and when that third shot rung out and when I was close to the ground - you could tell the shot was coming from above and kind of behind.” (When asked if he’d “heard it come from sort of behind the *motorcade* and then above?”) “Yes.” (When asked if he felt Kennedy was hit by the first shot) “No, sir, I don’t think so.” (When asked what happened after the second shot “he slumped over and Mrs. Kennedy, she climbs over in the seat with him and pulls him over.” (When asked to clarify if he saw Kennedy hit in the neck by the third shot or was just guessing) “I just saw him hit once.” (When asked if he thought shots could have been fired from depository) “Well, it sounded like it was high, you know, from above and kind of behind like - in other words, to the left.” (When asked the pattern of the shots) “Well they was pretty fast and not fast either. It seemed like he had plenty of time to operate his gun plenty well - when the shots were all fired.” (When asked the length in time of the shooting) “Oh, probably 2 minutes..It might not have been that long.” When asked again the pattern of the shots) “They seemed pretty well evenly spaced.” (8-2-68 interview with Barry Ernest recounted in *The Girl on the Stairs*, published 2011) “He stopped exactly where the Moorman photograph showed him standing. He told me of the excitement of seeing the president, then the horror of watching as Kennedy's skull exploded a mere 60 feet in front of him. When I inquired about the shots, he repeated what he had said to the Commission: they sounded as if they came from above, behind, and to the left. 'Above, behind, and to the left of what?' I asked. 'Above and behind the motorcade, and to the left of me' he replied. (When asked the number of the shots) 'Well, there were definitely three that I heard,' he explained, 'But one of them was a bit unusual.' (When asked what he meant by unusual) 'Well, it sounded different from the others. It was louder, sharper, cleaner than the others. And two of them was close together, like bang.....bang, bang.' (When asked if he'd told this to the Commission) 'I stand by what I just said.'” (When asked if the shots could have come from the picket fence) 'I don't know,' Hudson said, after a pause. 'I really don't. There was so much excitement and it all happened so fast, I'm just not sure.'” (HSCA outside contact report, 2-3-79, as quoted and summarized in the HSCA report) “Everything I told the Warren Commission was correct”... Hudson, now 71, had heard for years about the controversy about a shot from the knoll; he does not think that one was fired from behind the stockade fence.” **Analysis:** Hudson heard a shot when the limousine was back by the first streetlight (where it was at frame 190) but didn’t notice Kennedy was hit. He then witnessed the head shot, and heard another shot shortly thereafter. He confused the Warren Commission by guessing that the President suffered his neck wound with the last shot. Presumably, he confused the FBI when he spoke to them as well, as they have him saying the head shot was the first shot, and that two shots followed. **First shot hit 190-224. Last two shots bunched together (with the last shot after the head shot).**

F. Lee Mudd is a bit of a mystery man in that most researchers prior to myself had incorrectly assumed him to have been standing on the east side of the grassy knoll at the time of the shooting. His words, however, suggest he was on the west side. While many have argued that the young man described by Emmett Hudson, who sat down with him on the ground by the steps after the shooting, was the man to his left in the films, this man appears to have been an African-American (something Hudson would most probably have mentioned) and to have fled during the shooting. It follows then that the man in red a few steps below Hudson, who sat down with Hudson after the shooting, was in fact the young man described by Hudson, and most logically Mudd. While many have long assumed Mudd to have been an elderly man, and to have died in the early 1970's, this man may have had a son. The 1950 Shreveport LA City Directory lists a Lee Mudd, Jr., a student. This puts him at the right age to be the young man described by Hudson. There's reason to doubt he was the man in red, however, as some researchers suspect that "Lee Mudd, Jr." was not F. Lee Mudd, Jr., but Lee Sterling Mudd, identified in a September 5, 1937 Chicago Tribune article as the son of a Francis Lee Mudd. Lee Sterling Mudd is still

alive. So perhaps this mystery can still be resolved. Was Mudd the man in red? Or was it his father? Or was it someone else entirely? And why did the original article on Mudd refer to him as H. Lee Mudd? Stay tuned... **(11-23-63** article in The Shreveport Journal entitled Local Man Near Kennedy's Car at Time of Shooting) "H. Lee Mudd, who lives on Spring Ridge Road, was standing about 25 feet in front of the car in which President Kennedy was shot Friday in Dallas. 'I heard two reports that sounded like fire crackers,' Mudd said. 'Then I looked and the President had slumped down in his seat.' Mudd, who was in Dallas on a business trip, had taken time off to watch the parade. 'It happened so fast no one could tell exactly what had happened,' he said. 'But *we could tell he had been shot* and everybody could tell something terrible was going on.'"

(1-28-64 FBI report on an interview with Mudd, 24H538. Words subsequently removed by Josiah Thompson are in **bold**.) "On November 22, 1963, he was in Dallas, Texas, on a business trip to purchase clothing for his store. He operates the Southside Ranch, 9066 Mansfield Road, Shreveport, Louisiana, a western store. While in Dallas he decided to watch the parade for President Kennedy. *At about noon, he was watching the parade from a position on the north side of Elm Street and some 75 to 100 feet west of a building, which he later learned was the Texas School Book Depository.* He saw the president's car approaching from the east on Elm Street in the parade, and he recognized President Kennedy and saw him waving to the crowd. *When the President's car was some 50 or more feet away from him, he heard what sounded to him like two gunshots, and he saw the President slump.* Immediately thereafter, he observed the President's car pull out of the line of the parade and continue west on Elm Street toward the underpass. When the President's car came abreast of Mudd, he could see the President slumped down toward his wife, who was leaning over him. He recalled seeing another man in the car, whom he did not recognize at the time but whom he later learned was Governor Connally and this man appeared to be holding one arm to his side. However he did not notice this man much because his attention was focused on the President. Mr. Mudd stated he definitely recalls hearing two shots probably less than a second apart. He said there may have been a third shot fired, but he could not be sure of this. *He stated that immediately after the shots were fired, some of the spectators along the side of the street dropped to the ground, and he did so himself, inasmuch as the shots alarmed him and he did not know what had happened or where the shots had come from.* He looked around him, and he recalled that in looking toward the building nearby, he noticed several broken windows on **about the fourth floor**, and the thought occurred to him that possibly the shots had been fired through these broken windows. However, he did not observe any smoke, nor did he see anyone at the windows, nor did he notice any motion within the building. He said the building appeared to be abandoned. Subsequent to the shooting, he did not notice anyone enter or leave the building. Mr. Mudd stated that when the shots were fired, they sounded as if they came from the direction of the building. *Mr. Mudd stated that he remained in the vicinity for possibly three or four minutes, after which he walked back toward the main part of town, where he had parked his car.* He did not remain to talk to police or Secret Service men because he did not feel he had seen anything that would be of assistance to them. Mr. Mudd said that he was not with anyone else at the time this occurred. He said he later made another trip to Dallas, accompanied by his wife, and he showed her the place where the assassination occurred, and he observed the Texas School Book Depository building and he is confident this is the same building he was standing near at the time of the assassination. Mr. Mudd said he could furnish no further information regarding this matter."

(Mudd's FBI statement as quoted in Josiah Thompson's book Six Seconds in Dallas, **1967**. The words added-in by Thompson are in **bold**.) "He looked around him (**the FBI report relates**), and he recalled that in looking toward the building nearby, he noticed several broken windows on **the fourth floor of the Dal-Tex Building**, and the thought occurred to him that possibly the shots had been fired through these broken windows. However, he did not observe any smoke, nor did he see anyone at the windows, nor did he notice any motion within the building. He said the building appeared to be abandoned.

Subsequent to the shooting, he did not notice anyone enter or leave the building. Mr. Mudd stated that when the shots were fired, they sounded as if they came from the direction of the building." (Note also that by cutting off the report at this point, Thompson kept from his readers that Mudd returned to Dallas and identified the building in question as the Texas School Book Depository.) **Analysis:** since the FBI report on Mudd indicates he was on the north side of Elm Street, 75 to 100 feet west of the depository building, and that 1) the last burst of gunfire occurred when the limo was still 50 feet in front of him, and 2) he saw the President pass by just after these shots, it follows that Josiah Thompson was both wrong to depict Mudd as a witness on the east side of the knoll in Six Seconds in Dallas, and doubly wrong for inserting his own musings about the Dal-Tex Building into the words of the FBI's report. (Thompson, btw, acknowledged this mistake after I pointed it out to him.) Yes, far from being a witness for a Dal-Tex shooter, as claimed by Thompson in 1967, and repeated over the years, it appears the mysterious Mr. Mudd is in fact one of the two supposedly unidentified figures standing next to Emmett Hudson on the grassy knoll steps in the Muchmore film. As Mudd was in Dallas buying western wear, moreover, we can assume he is the little guy in front of Hudson in the film, wearing what appears to be a red western shirt, blue jeans, and brown boots. We should also note that Mudd, much as the "young fellow" described by Hudson, sat down on the ground after the shots. That Mudd is indeed this man is further suggested by the fact that Mudd told the FBI he'd had to walk some distance back to his car, and that Hudson, who'd stood next to the man in red, testified that the "young fellow" he encountered had mentioned walking in from a distant parking lot. While it's slightly problematic that Mudd was in Dallas on business, and Hudson said the "young fellow" worked on Industrial Blvd., this can be explained by the simple fact that the two had only engaged in small talk, and the possibility that one or more of the clothing outlets Mudd had visited was over on Industrial Blvd. While it's a more significant problem that Hudson said this man was a "young fellow" and that the Mudd running the Southside Ranch in 1963 was, according to the Genealogy Dept. of the Shreveport Library, Francis Lee Mudd, 60 years old, the thought occurs that Hudson never identified this "man" as a "young fellow" until testifying 8 months after the shooting, and that he may have simply confused Mudd with a "young fellow" he'd met sometime after the shooting. **Did not hear the first shot. Only heard two shots. Last two shots bunched together.**

Wilfred or Wilfred Daetz is a little-known witness, and is probably not worth mentioning, outside the intriguing possibility he was the other man on the steps with Hudson and Mudd. He is reported to have called the Dallas Chief of Police in 1966 and to have said he'd been a witness. The Dallas Chief of Police told the FBI about him, and the FBI investigated. At that time, however, Daetz reportedly denied making the phone call to Dallas and denied being in Dallas in November, 1963. When the FBI confronted him with the fact that the phone call had been billed to his phone, Daetz reportedly claimed the whole thing must have been a practical joke. It seems probable that Daetz lied to the FBI. Perhaps he'd called Dallas on a lark and was trying to cover up his behavior. On the other hand it's possible he was afraid to tell the FBI what he'd seen, or was intimidated into retracting his statements. It's unlikely we'll ever know. What is certain, however, is that nothing he said was so outrageous that it should be dismissed out of hand. If Daetz had called Dallas while drunk and/or seeking attention, it seems likely he would have made up a more colorful story. (12-7-66 letter from Dallas Police Chief Charles Batchelor to Dallas FBI agent-in-charge J. Gordon Shanklin) "I received a long distance phone call at 1:40 p.m. December 5, 1966, from New York City, from a person who identified himself as Wilfred Daetz...The subject stated that on November 22, 1963, at the time of the assassination of President Kennedy, he was standing on the grass on the north side of Elm Street--on the slope approaching the triple underpass. He recalls only one shot and that immediately after the shot he ran up the slope toward the railroad tracks and was stopped by an unknown police officer who pointed a pistol at him and shouted "Where are you going?" He then returned down the slope. The subject stated that he could hear very little out of his left ear and that he heard the shot with his right ear and in his opinion the shot

came from his right which was in the direction of the railroad tracks. He also stated he saw a puff of smoke come from behind the fence near the railroad tracks. He stated that he was so excited he doesn't recall any additional shots. He further stated that at the time of the incident, he did not reveal himself and had talked to no one regarding this until the recent publicity. He states that then he revealed himself and made a statement to the Federal Bureau of Investigation in New York City." **Analysis: too vague. Saw smoke on knoll (if he was actually there).**

Lee Bowers was working in a railroad tower in the train yard north of the grassy knoll. **(11-22-63** Affidavit to the County of Dallas, box 2 folder 1 file 15 of the Dallas JFK Archives) "I heard at least three shots very close together." **(11-22-63** report of the Dallas County Sheriff's Department, 19H510) "He said he heard what sounded like three shots from a rifle." **(4-2-64** testimony before the Warren Commission, 6H 284-289) (When asked if he saw any men between his own location and Elm Street) "Directly in line, towards the mouth of the underpass, there were two men. One man, middle-aged, or slightly older, fairly heavy-set, in a white shirt, fairly dark trousers. Another younger man, about mid-twenties, in either a plaid shirt or plaid coat or jacket...They were standing within 10 or 15 feet of each other, and gave no appearance of being together, as far as I knew...They were facing and looking up towards Main and Houston, and following the caravan as it came down." (When asked if he could see the corner of Houston and Elm from his location) "after they passed the corner of Elm and Houston the car came in sight again...I heard three shots. One, then a slight pause, then two very close together. Also reverberation from the shots...The sounds came either from up against the School Depository Building or near the mouth of the triple underpass...At the moment I heard the sound, I was looking directly towards the area---at the moment of the first shot, as close as my recollection serves, the car was out of sight behind this decorative masonry wall in the area.... It came in sight immediately following the last shot...At the time of the shooting there seemed to be some commotion...I just am unable to describe it rather than it was something out of the ordinary, a sort of milling around, but something occurred in this particular spot which was out of the ordinary, which attracted my eye for some reason, which I could not identify." **(6-28-66** UPI article, found in the Los Angeles Herald-Examiner) "He observed two men in the area between the fence and the colonnade before the shooting but did not notice them later. Had an automobile been wedged in that area, he could not have missed it. Bowers says he saw a 'flash' or 'some kind of disturbance' under the trees atop the knoll at the time of the shooting. He saw no individual firing or anyone rushing from the scene but he thinks there is 'at least a 50-50 chance that something happened there' and it could have been a second gunman."

(Interview with Mark Lane in *Rush to Judgment*, **1966**) "At the time of the shooting, in the vicinity of where the two men I described were, there was a flash of light or—there was something which occurred that caught my eye. What this was I couldn't say at the time and at this time I couldn't identify it, other than that there was some unusual occurrence, a flash of light or smoke or something, which caused me to feel that something out of the ordinary had occurred there...There were three shots. These were spaced with one shot, then a pause, and then two shots in very close order, such as perhaps (He raps on table with his hand "rap...raprap"). Almost on top of each other, while there was some pause between the first and second shots." (When asked if he told this to the FBI) "When I stated that I felt like the second and third shots could not have been fired from the same rifle, they reminded me that I wasn't an expert, and I had to agree." (Unreleased segments of Bowers' **1966** interview with Mark Lane, from a transcript of the interview found in the papers of *Rush to Judgment* director Emilo de Antonio at the Wisconsin Historical Archives, and published online by Dale Myers, 2004)) (When asked if there were any pedestrians between his location and Elm Street) "Directly in line - uh - there - of course is - uh - there leading toward the Triple Underpass there is a curved decorative wall - I guess you'd call it - it's not a solid wall but it is part of the - uh - park....And to the west of that there were - uh - at the time of the shooting in my vision only two men. Uh - these two men were - uh - standing back from the street somewhat at the top of the incline and were very near - er - two trees which were in the

area...And one of them, from time to time as he walked back and forth, uh - disappeared behind a wooden fence which is also slightly to the west of that. Uh - these two men to the best of my knowledge were standing there - uh - at the time - of the shooting...Ah - one of them, as I recall, was a middle-aged man, fairly heavy-set with - what looked like a white shirt. Uh - he remained in sight practically all of the time. The other individual was uh - slighter build and had either a plaid jacket or a plaid shirt on and he - uh -is walking back and forth was in and out of sight, so that I could not state for sure whether he was standing there at the time of the shots or not..." (When asked if he saw anyone suspicious in the area) "Other than these two and the people who were over on the top of the Underpass who - that were, for the most part, were railroad employees or were employees of a Fort Worth welding firm who were working on the railroad, uh - there were no strangers out in this area." (When returning to the question of whether or not anyone was shooting from behind the fence) "Now I could see back or the South side [Note: here MYERS adds "BOWERS is actually speaking of the north side of the fence] of the wooden fence in the area, so that obviously that there was no one there who could have - uh - had anything to do with either - as accomplice or anything else because there was no one there - um - at the moment that the shots were fired." **Analysis:** as we've seen time and time again, the bunching of the last two shots means the first shot hit. The bunching of these shots, moreover, makes Bowers a good witness for conspiracy. It should be pointed out, however, that Bowers is, despite widespread belief to the contrary, a terrible witness for the grassy knoll gunmen so many embrace as the cornerstone of this conspiracy. In opposition to what so many assume, Bowers never said he heard a shot come from the area around the picket fence, just that something there caught his eye. The unedited transcript of Bowers' interview with Mark Lane, moreover, is even more damaging to the case for a grassy knoll gunmen. It suggests both that the two men many think Bowers saw behind the fence were in fact in front of the fence, (quite possibly even Emmett Hudson--who wore a white shirt---and the man we presume is F. Lee Mudd--who wore what appears to be a red plaid shirt), and that Lane has been deceptive on this matter. **First shot hit 190-224. Last two shots bunched together.**

Abraham Zapruder stood on a pedestal in the arcade on the North side of Elm. (11-22-63 notes of Dallas Times Herald reporter Darwin Payne, from his reporter's notebook on display in Dallas' Old Red Museum, as quoted by Jim Schutze in The Dallas Observer, 4-28-11. These notes were purportedly written shortly after the shooting, after Payne arrived in the Plaza, was told Zapruder had filmed the shooting, and tracked Zapruder down at his office in the Dal-Tex Building.) (quoting Zapruder) "I got film. I saw it hit him in head. They were going so fast. (Illegible) 1st shot he (illegible) over and grabbed. 2nd two shots hit him in head. It opened up. Couldn't be alive. She was beside him. After last shot she crawled over back of car." (11-22-63 notes of an unknown reporter, possibly Darwin Payne, or possibly someone at the paper writing down what Payne had reported over the phone after talking to Zapruder. These notes were found in the files of the Dallas Times Herald, and quoted in Pictures of the Pain, p. 149.) "Abraham Zapruder...heard 3 shots///after first one Pres slumped over grabed stomach... hit in stomach...two more shots///looked like head opened up and everything came out...blood spattered everywhere...side of his face...looked like blobs out of his temple... forehead... Jackie first reached over to the Pres. And after second shot...she crawled over to back of car...after that she was lying..." (11-22-63 interview on WFAA, at approximately 2:10 PM) "as I was shooting, as the President was coming down from Houston Street making his turn, it was about a half-way down there, I heard a shot, and he slumped to the side, like this. Then I heard another shot or two, I couldn't say it was one or two, and I saw his head practically open up, all blood and everything, and I kept on shooting." (Volunteering, moments later) "As I explained before, it was a sickening scene. At first I thought perhaps it was a...it sounded like somebody making a joke, y'know, a shot and somebody grabbing their stomach." (9:55 PM 11-22-63, memo of SS Agent Max Phillips accompanying a copy of the Zapruder film) "According to Mr. Zapruder, the position of the assassin was behind Mr. Zapruder." (12-4-63 FBI report, CD7 p.12) "He stated he had started taking pictures prior to the first shot being fired...Zapruder

advised he could not recall but having heard only two shots.” (7-22-64 testimony before the Warren Commission, 7H569-576) “Well, as the car came almost in line. I was standing up here and I was shooting through a telephoto lens, which is a zoom lens and as it reached about--I imagine it was around here--I heard the first shot and I saw the President lean over and grab himself like this (holding his left chest area)...In other words, he was sitting like this and waving and then after the shot he just went like that...Leaning—leaning toward the side of Jacqueline. For a moment I thought it was—you know, like you say, “Oh, he got me,” when you hear a shot...but before I had a chance to organize my mind, I heard a second shot and then I saw his head opened up and the blood and everything came out and I started—I can hardly talk about it. (the witness crying).” (When asked how many shots he heard) “I thought I heard two, it could be three, because to my estimation I thought he was hit on the second—I really don’t know...I heard the second—after the first shot—I saw him leaning over and after the second shot—it’s possible after what I saw, you know, then I started yelling, “They killed him, they killed him.” (When asked where the shots came from) “I also thought it came from back of me...I assumed that they came from there, because as the police started running back of me, it looked like it came from back of me.”

(9-21-64 interview with William Manchester, as represented in *The Death of a President*, 1967) (On the aftermath of the first shot) "As the Lincoln emerged from behind the freeway sign, it reappeared in Abe Zapruder's line of vision. Abe saw the stifled look on the Presidents face and was stunned. Continuing to train his camera on the car, he wondered whether Kennedy could be pretending. It was as though he were saying, "Oh, they got me." Abe thought 'The President is to joke?'" (Manchester's narration of the aftermath of the head shot) "Abe Zapruder screeches over and over, 'They killed him! They killed him! They killed him! They killed him!'" (11-15-64 AP article, found in the Abilene Reporter-News) "I heard the shot and saw the President grab his heart and lean over towards Jacqueline. I thought he was making believe, saying 'Oh, he got me' but then I thought, 'No, a president wouldn't be joking.' Then another shot broke his head open. I started yelling 'They killed him. They killed him.' But I kept on taking pictures until the limousine disappeared, still aiming through the viewfinder." (Interview with CBS broadcast 6-26-67) (On whether the shots could have come from the picket fence to his right) "I'm not a ballistics expert, but I believe that if there were shots that come from my right ear, there would be a different sound. I heard shots coming from--I wouldn't know which direction to say--but they was driven from the Texas Book Depository and they all sounded alike. There was no difference in sound at all." (2-13-69 testimony in the trial of Clay Shaw) “I saw the approaching motorcade...coming down towards the underpass. As they were approaching where I was standing I heard a shot and noticed where the President leaned towards Jackie. Then I heard another shot which hit him right in the head, over here, and his head practically opened up and a lot of blood and many more things came out.” (When asked about the first shot) “As I said, he grabbed himself with his hand towards his chest or throat and leaned towards Jackie.” (And the second) “He leaned about the same way in falling towards Jacqueline, forward, down towards the bottom of the car.” **Analysis:** Zapruder thought he heard a shot after the head shot, but then talked himself out of it. He initially said he heard three shots and described the last two as coming together. He then went on TV and realized he couldn’t say for sure if it was one or two. When asked by the Warren Commission he started to explain that he thought there was a shot after the head shot but then backed off. Since he felt sure the shots hadn’t come from his right, he told CBS he was convinced that the shots came from the sniper's nest. He overlooked or avoided that a shot from the sniper's nest would have come from his left, and that his earliest recollections were that the shots came from neither the picket fence nor the sniper's nest, but from directly behind his location. Zapruder's placement of the first shot is also of interest. As pointed out by Harold Weisberg in his book *Whitewash*, Zapruder testified, while looking at frames from his film, "as it reached about--I imagine it was around here--I heard the first shot" but the counsel taking his testimony, Wesley Liebler, failed to note where "here" was. This suggests that Zapruder identified a

point after Kennedy had stopped waving but before Kennedy disappeared behind the sign as the moment of the first shot, and that, since the timing of this shot didn't support the scenario already chosen by the Commission, they saw no reason to record his observation. Only heard two clear shots. **First shot hit 190-224. Last two shots possibly bunched together (with the last shot possibly after the head shot).**

Marilyn Sitzman stood beside her boss Abraham Zapruder. (11-22-63 notes on an interview of Sitzman by a Dallas Times-Herald reporter, presumably Darwin Payne, as presented in The Zapruder Film by David Wrone, 2003) "Shot hit pres. Right in the temple." (11-23-63 report of Deputy Wiseman, 19H535) "I talked to a Marilyn Sitzman... She said the shots came from...the old Sexton Building." (11-29-66 interview with Josiah Thompson, as found in an online transcript and recounted in Six Seconds in Dallas, 1967) "There was nothing unusual until the first sound, which I thought was a firecracker, mainly because of the reaction of President Kennedy. He put his hands up to guard his face and leaned toward the left, and the motorcade proceeded down the hill" (Thompson then describes) "Both Zapruder and Marilyn Sitzman at first thought the President and Governor Connally were joking--that they, too, had heard the firecracker noise and were pantomiming 'Oh, he got me!'" (a subsequent discussion of the head shot) "And the next thing I remembered correct...clearly was the shot that hit him directly in front of us, or almost directly in front of us, that hit him on the side of his fa..." (When asked where the bullet struck) "I would say it'd be above the ear and to the front... between the eye and the ear...And we could see his brains come out, you know, his head opening. It must have been a terrible shot because it exploded his head, more or less...And as far as the sound of the shots go, the first one, as I said, sounded like a firecracker, and the second one that I heard sounded the same...the loudest thing I heard that afternoon was the siren..." (Interview in Life Magazine, November 1983) "They had just come down the hill. I heard shots, and I thought, firecrackers. All I could see was his hands going up. Then he was right in front of us...The last shot got him in the head. Everybody was on the ground, and Mr. Z was gone. There had been gunshots, and I was standing there all by myself." (The Men Who Killed Kennedy, broadcast 1988) "Finally, they come around the corner, and start coming down, and they're you know waving at everybody, and then we heard what to me sounded like two firecrackers. You know it was starting to get a little confusing because you could see things happening in the car. And you couldn't quite get what was happening until they got right here in front of us and the third shot hit Mr. Kennedy right in his head. We knew what happened." (Article by Hal Verb in the 9-30-94 JFK Resource Group Newsletter) "...I recalled an interview I had with Marilyn Sitzman, an eyewitness to the JFK assassination who was standing with Abraham Zapruder (in fact, holding him so that he wouldn't fall as he was filming the motorcade). She and I were standing right near the pedestal where both she and Zapruder stood upon. It was the last day of the Dallas "ASK" conference (Oct. 25, 1992). Sitzman told me she knew a lot about guns and weapons having grown up with them. She told me the shot that killed the President came from behind and that the gunman must've used a silencer (her emphasis). She said that if it were not a silencer the shot would have knocked down both of them because of where they were so precariously standing. She then told me of the great "reverberation" that was felt. I showed her a map of the Dealey Plaza area (she signed it) and she pointed to the area when she thought the shot was fired from. Curiously enough, it was not from the alleged and traditionally targeted picket fence area but from a location in the direction of the north pergola. This would be to the left of and behind where Charles Hester was standing." (6-29-93 oral history for the Sixth Floor Museum) "(We) went over to where that concrete pergola was, and we decided that would be the best place... [Mr. Zapruder] said, 'You'll have to stand behind me and hold onto me.' So, we both got up there, and I...held on to him. I only remember when they started...turning into the street, he said, 'OK, here we go.' That's when I remember he started actually doing the filming. Yeah...They turned the corner, and they started coming down. And the first thing I remember hearing was what I thought was firecrackers because Kennedy threw his hands up, and I heard 'bang, bang.'"

Now, there could have been a third “bang,” I can’t swear to that one. But I know there were two “bangs” very close together, and I thought they were firecrackers because his arms were going into the air, and it was way off to my left and above. So, you know, I’m just kind of like... what a stupid thing to throw firecrackers, and as they came down... the last shot that we heard was right in front of us and it was like the same sound—far off and to the left—but I saw his head open up and I saw the brains coming up. So, of course, by this time, I knew it wasn’t firecrackers. But those were the only sounds I heard.” (Interview in *Image of an Assassination*, 1998) “When they started to make their first turn, turning into the street, then he says “Okay, here we go” or something to that effect.” **Analysis:** Ms. Sitzman only heard two separate bursts of gunfire but sometimes “corrected” her memory and turned the early firecracker sound into two separate shots. To no avail. Her description of any two shots as “Bang! Bang!” automatically rules out that there was a single assassin using Oswald’s rifle. **Only heard two shots. First shot hit 190-224.**

Newmans Mark the Spots

Above and at right: the Newmans in a 2003 oral history for the Sixth Floor Museum.

At right: the location from where Bill Newman thought the shots derived, as depicted on 11-22-63 by Jay Watson of WFAA, and as marked by Bill himself during the 1986 mock trial of Oswald.

At top: Bill Newman in the Muchmore film.

Above: the Newmans on the grass in the Bell film.

Since Kennedy was shot in the head just after passing Bill Newman, who was standing on the north side of the street, (as shown in the Muchmore film), and Newman dived to the ground just afterward, (as shown in the Bell film), the location of Newman and his wife is a one way of marking the location of the limo at the time of the head shot. All too many, however, overlook that the Newmans can be used to mark other spots as well. The Newmans have long described a bullet impacting on the side of Kennedy’s head, near his ear (as shown in the two photos at top, middle) and that they thought this bullet came from behind them, and not from the picket fence to their right, or book depository to their left.

Newmans Mark the Spots

William Newman was standing on the north side of Elm Street with his wife and two kids and can be seen in the Muchmore film just behind Kennedy as the fatal shot is fired. (11-22-63 interview on WFAA, prior to the announcement of the President's death, at approximately 12:45) “We were, we just come from Love Field after seeing the President and First Lady, and we were just in front of the triple underpass on Elm Street at the edge of the curb, getting ready to wave at the President. (After being asked to clarify his position) We were halfway in between the triple underpass. We were at the curb when this incident happened. But the President’s car was some fifty feet in front of us still yet in front of us coming toward us when we heard the first shot and the President. I don’t know who was hit first but the President jumped up in his seat, and I thought it scared him, I thought it was a firecracker, cause he looked, you know, fear. And then as the car got directly in front of us well a gunshot apparently from

behind us hit the President in the side of the temple.” (As he says this last line he points to his left temple) (When asked if he thought the first shot came from the same location) "I think it came from the same location apparently back up on the mall, whatchacallit." (When asked if he thought the shot came from the viaduct) "Yes, sir, no, no, not on the viaduct itself but up on top of the hill, on the mound, of ground, in the garden." (When asked from how far away the shots were fired) "I have no idea. I didn't see where the gunshots come from. I believe we was looking directly at the President when he was hit. He was more or less directly in front of us. We didn't realize what happened until we seen the side of his head, when the bullet hit him. (When asked if he saw blood) "Yes sir, we seen it. I seen it" **(11-22-63** second interview on WFAA, prior to the announcement of Kennedy's death, at approximately 1:00 PM) (When asked if he felt the shots came from different directions) "No sir, actually I feel that they both come from directly behind where we were standing. The President, it looked like he was looking in that direction. I don't know whether he was hit first. Apparently he wasn't. It looked like he jumped up in his seat, and when he jumped up he was shot directly in his head. I don't know whatchacallit--the mall behind us--but apparently (interviewer Jay Watson finishing his thought) "that's where he was." **(11-22-63** third interview on WFAA, at approximately 1:10 PM) "My wife and my two sons were standing at the curb, looking at the President approaching us, when we heard a blast. And the President looked like that he right jumped up in his seat, and by that time he was directly in front of us. And then he.....we seen him get shot in the side of the head. He fell back in the seat and Governor Connally was holding his stomach." (When asked if the shots were almost simultaneous) "Yes sir, they were probably 10 seconds apart." (When asked if he heard a third shot) "I didn't hear a third...I don't recall a third shot. There may have been. We hit...my family hit the ground. I don't recall a third shot. I just couldn't...I'm not certain of that. I do know I heard two shots." **(11-22-63** statement to Dallas Sheriff's Department, 24H219) "We were standing at the edge of the curb looking at the car as it was coming toward us and all of a sudden there was a noise, apparently gunshot. The President jumped up in his seat, and it looked like what I thought was firecracker had went off and I thought he had realized it. It was just like an explosion and he was standing up. By this time he was directly in front of us and I was looking directly at him when he was hit in the side of the head." **(11-24-63** FBI report, 22H842) "when the President's car was approximately 50 feet from him proceeding in a westerly direction on Elm Street, he heard the first shots fired...the shots were fired in rapid succession which he thought at the time was a firecracker. The car was proceeding toward him and it seemed that the President's arms went up and that he raised up in his seat and started to look around. The car proceeded to a point about even with him and he could see Governor John Connally was holding his stomach. About that time another shot was fired which he estimated was ten seconds after the first shot was fired. At that time he heard the bullet strike the president and saw flesh fly from the President's head... Newman first thought the President and Governor were playing some kind of a game."

(11-29-66 taped interview with Josiah Thompson, as recounted in Six Seconds in Dallas, 1967) "We were looking back up the street to see if the motorcade was coming and the first two shots were fired, and of course the first shot, boom, the President threw his arms up like that, spun around sort of...and then it looked like he was looking in the crowd, you know, like he was looking for something, just kind of a wild expression..." (When asked the spacing of the first two shots) "about a second apart." (When asked about a drawing in which he depicted the fatal bullet's striking Kennedy by his ear) "That's what I saw. The way he was hit, it looked like he had just been hit with a baseball pitch, just like a block of wood fell over his... (When it was pointed out to him that he was moving his head backwards and to the left, and his drawing had depicted a wound by the ear) "In my opinion the ear went." (When asked if he thought shots came from in back of him) "That's right. Well, of course, the President's being shot in the side of the head by the third shot--I thought the shot was fired from directly behind where we were standing. And that's what scared us, because I thought we were right in the direct path of gunfire." (When asked again if his impression was that the bullet entered the side of the head) "Right. Right. My

thoughts were that the shot entered there and apparently the thoughts of the Warren Commission were that the shot came out that side.” (When asked again if his impression was that the shots came from behind where he was standing) "Right. Well I think everybody thought the shots were from where I'm saying--behind us--because everybody went in that direction. Must have." (When asked if "behind us" would include the direction of the depository building) "Well, this is going to sound peculiar, but I was thinking more just the opposite of the building...actually the thought never entered my mind that the shots were coming from the building...But, of course, I've talked to people and they say, at that height, it echoes... (When asked if it was his impression then that the shots came from the right front of the President) "The thought never entered my mind that it was coming from the rear." (At another point in the book) "I thought the shots were coming from right off the tops of our heads...When we turned around, I think...well, several people hit the ground." (2-17-69 testimony in the trial of Clay Shaw) (When asked how many shots he heard) "I heard at least three. I often thought of four, but I can't clearly say there were four shots; I can clearly say there were three." (When asked if he developed an impression from where the shots had been fired) Yes, sir. From the sound of the shots, the report of the rifle or whatever it was, it sounded like they were coming directly behind from where I was standing." (When asked to point out the location on an aerial photograph of the plaza) "In my opinion, the sounds of the shots sounded as if they had come from directly behind me (indicating). I was standing near this light standard here, and I thought the shots were coming from back here, and apparently everybody else did because they all ran in that direction." (When asked to point it out on a mock up of the plaza) "(Indicating) From back in this direction here directly behind me. At the time -- you want me to mention the third shot?" (When asked to describe the shooting in more detail) "My wife and myself were watching the parade come toward us. We had to more or less step off the curb to look up the street, and as the car was approaching I heard two shots -- BOOM, BOOM -- and when the first shot was fired the President threw his hands up like this (demonstrating), and at the time what we thought had happened, somebody threw firecrackers or something under the automobile and he was protecting his face. At the time of the first shot Governor Connally turned in his seat in this manner (demonstrating), to look back at the President I suppose, and then the second shot was fired, and then as the car approached us to where we were standing, I could see Governor Connally leaning back in his seat holding his hands down like this (demonstrating), and at that time I could see blood on his shirt, and that is when I actually realized that it appeared, you know, he had been shot. The President all the time was staying in an upright position in his seat and it looked like he was looking into the crowd of people as if he was trying to see someone. I caught a glimpse of his eyes, just looked like a cold stare, he just looked through me, and then when the car was directly in front of me, well, that is when the third shot was fired and it hit him in the side of the head right above the ear and his ear come off... I observed his ear flying off, and he turned just real white and then blood red, and the President, when the third shot hit him he just went stiff like a board and fell over to his left in his wife's lap, and I told my wife, "That is it, hit the ground," and that is when we hit the ground because I thought the shots were coming over our heads. And then I looked back and I saw Mrs. Kennedy jumping up on the back end of the car and the Secret Service man or whoever it was into the car, and then they shot on off, took off." (When asked how far he'd been from Kennedy at the time of the fatal shot) "I was the width of one lane, approximately 10 or 15 feet. I was standing on the curb's edge, edge of the curb. They were in the second lane." (When asked Kennedy's reaction to the shot) "The only reaction that I can recall -- I don't recall whether his head went back or forward, but I do recall when the impact hit him that he just stiffened and he went to the left, real hard to the left and into her lap, and... He went away from me."

(The Kennedy Assassination Tapes, 1979) Civilian L "When the President's car came around the corner, I had a good view from about 150 feet. About that time I heard two loud sounds about three seconds apart. I didn't associate them with gunshots... They seemed more like firecrackers. However, I did notice a change in President Kennedy, his arm went up and he seemed to stiffen. Just after the two

sounds...the limousine stopped for an instant, a large man in the right front seat picked up what looked to be a telephone, and then the car shot forward again. Some of the agents on the following car got off...From a distance of 12-to 15 feet...we saw the bullet hit the President from the right rear and literally tear away the side of his scalp and right ear...Thinking about it afterwards, I had the impression that they had been fired from behind us. I noticed Mr. Zapruder with his camera and thought it was a gun. My impression was only "behind us," not from the stockade fence. I am certain no shot was fired from there." (7-23-86 testimony in televised mock trial, On Trial: Lee Harvey Oswald) "As the President's car come towards us, probably 200 feet or so from us, we heard a Boom (one second pause) Boom, like that. The President sorta threw his arms up, and we thought at that time maybe someone had throwed firecrackers or something beside the President's car. As the President's car came closer to us, we could see that something was wrong. Governor Connally, I could see the blood on his shirt, and Governor Connally's eyes protruding. And the President was looking into the crowd of people. He was moving his head about and looking into the crowd of the people. And just as the President's car got directly in front of me, the President was probably fifteen feet away, Boom, and the side of his ear flew off, and just a, bits and pieces flew off. I can remember seeing just a white flash, and then the red, and the President fell across the car, as if you'd hit him with a bat. He fell across the car, and back, into Mrs. Kennedy's lap. I remember her saying 'Oh my God! They've shot Jack!'...Mrs. Kennedy...At that time I turned to Gayle and I said 'That's it! Hit the ground! We hit the ground because we thought we were in direct line of fire. (When asked where he thought the shots were coming from) Sir, I thought the shots were coming from directly behind. (When asked to mark on the map where he thought the shots came from) It would be somewhere back in this general area. (He then makes a large mark across the southern side of the Elm Street extension back behind the eastern half of the arcade, to the West of the School Book Depository). (When asked by Bugliosi if he thought the shot that hit Kennedy in the head was the last shot) "Yes sir, I do." (Interview in The Men Who Killed Kennedy, broadcast 1988) "I can remember seeing the side of the President's ear and head come off. I remember a flash of white and red and just bits and pieces of flesh exploding from the President's head. At that time, I turned to Gayle and said "That's it, hit the ground." And we turned and hit the ground and covered our children. When the third shot was fired I thought it came from directly behind, towards the grassy knoll behind me. I base that primarily on the third shot, from what I saw, the sight of the President's head coming off, and from the sound of the rifle, the report of the rifle" (Interview in 1988 TV documentary JFK: The Day The Nation Cried) "We thought someone had thrown firecrackers or something against the President's car. It just looked like a bad joke. Of course, as the motorcade came closer to us we could see that it was not a joke. I remember the President throwing his hands up as if--I thought--to shield his face from the debris or something from the firecrackers, when in reality it was reaction to the gun shot that had hit him."

(Interview with Jim Marrs published in Crossfire, 1989) "As he was coming straight toward us there was a boom, boom, real close together. I thought someone was throwing firecrackers. He got this bewildered look on his face and was sort of slowing moving back and forth. The he got nearer to us, and, bam, a shot took the right side of his head off. His ear flew off. I heard Mrs. Kennedy say 'Oh, my God, no, they shot Jack!' He was knocked violently back against the seat, almost as if he had been hit by a baseball bat. At that time, I was looking right at the President and I thought the shots were coming from directly behind us. I said, "That's it! Get on the ground!" (Excerpt from 1991 interview with Mark Oakes, found online) "As the car got directly in front of us, the President was not much further than I am to you--probably ten to twelve feet, he was directly in front of me--the third shot rang out and I remember seeing the side of his head come off...I was looking straight at him and I remember seeing him go across the car and into Mrs. Kennedy's lap." (When asked if it hit him in the temple) "It appeared right in this area here (as he motions to his temple)" (11-19-93 article in USA Today) "Bill Newman, 52, was also at the scene. He and his wife, Gayle, were captured on film covering their two

young children with their bodies as gunfire rings out. He's not sure if there was a conspiracy, but he is certain the matter should be investigated further." (**11-20-97** interview published in *No Case To Answer*, 2005) "the President's car was out the distance of one lane from the curb line and some one hundred and fifty feet from us, some short distance, when the first two shots rang out. And it was a boom-boom. They were very close together and I could remember thinking "Boy, that's a poor thing to do." I thought someone had thrown a couple of firecrackers at the side of the President's car. At that moment, I didn't realize that it was gunfire and the President had been shot. I can remember his arms go up...he just kinda came forward and made a motion and apparently he was hit by one of the first two shots. As the car got closer to us I could see that something was wrong. I could see Governor Connally and I could see his eyes protruding and I could see him holding himself and I could see blood on his shirt. I can remember that the President looked to me like he was sorta looking into the crowd with a bewildered look on his face. As the car got directly in front of us--and we were on the curb's edge--and the President was probably not much further than I am from you (about ten feet) the third shot rang out and I can remember seeing the side of President Kennedy's head blow off. There was black matter and then grayish and he fell across Mrs. Kennedy, into her lap, and she jumped up and hollered "Oh my God no. They've shot Jack." And I turned to Gayle and I said: "That's it--hit the ground." And we turned and pushed our kids down on the ground behind us." (When describing his impression of the direction from which the shots were fired) "From my view it was just "behind" and it was a visual impact it had on me of seeing the head wound and seeing President Kennedy go across the seat. That gave me the impression of the shot being fired from behind..."

(*No More Silence* p. 94-101, published **1998**) "As the President's car started down Elm, the first two shots were fired. It was BOOM!...BOOM! like that. The first two were much closer together in my opinion. It's hard for me to tell the time frame because my concentration was on the President's car. I'm sure the Zapruder film can tell exactly the time frame. But the first two shots were much closer than the third shot. At that time I thought someone had thrown a couple of firecrackers or something beside the President's car. I didn't even realize at that time it was gunfire. The President's car was probably 150 feet or so from us at the time. As the car came closer to us, it was obvious something was wrong. I could see Governor Connally; I could see his protruding eyes, and I could see him more or less frozen in the seat holding himself. You could see the blood on Governor Connally and President Kennedy. When the first two shots were fired, he threw his arms up. I believe I said at the time that he raised up in his seat, which I think, in reality, all he did was throw his arms up. I can remember him turning, looking into the crowd, and just as the car passed in front of us at a distance of ten to fifteen feet, the third shot rang out, and it hit the President. It appeared to me that it hit him on the side of the head, as the side of his head came off. I can remember seeing a white mass, and then just a mass of red. The President fell across the car away from me over into Mrs. Kennedy's lap. It was as if someone had given him a hard shove. It wasn't like slow motion. He went across the seat pretty quick. Mrs. Kennedy jumped up and said, "Oh my God, no, they've shot Jack!" Then I recall her on the back of the car when the Secret Service agent ran toward the car and pushed her back in. When the third shot rang out, I turned to Gayle and said, "That's it! Hit the ground!" because at that time I thought the shot came from directly behind us in the grassy knoll area. The only basis I had for that was what I visually saw: the President going across the car and seeing the side of his head come off. The sound played little factor. I believe it was a visual thing at that time. We turned and hit the ground and threw our children down and covered them." (**November 1998** interview with *Texas Monthly*) "When his car was probably a hundred fifty feet or so from us, the first two shots rang out and it was boom!(smacks his hand) boom! (smacks his hand again) like that."

(*Oral History for the Sixth Floor Museum*, **7-10-03**) "When he was probably a hundred feet or so from us, the first two shots rang out, and I can remember hearing a boom (slaps hands) boom (slaps hands) about like that. I thought somebody had thrown a couple of firecrackers or something beside the

President's car. I did not recognize it even to be gunfire. And I can remember I thought now that's a pretty poor joke--somebody doing something like that. And the President's hands came up. I actually testified that day that the President came up out of his seat, which in reality he didn't stand up, but he just threw his arms up, kinda raised up in his seat. As the car got closer to us I could see Governor Connally and I could see his protruding eyes, and I could see the blood on his shirt. He was outstretched in the car. And just as the President got straight in front of us, which is the width of that one lane. We were right on the curb, and just as he got straight out from the curb from us, the third shot rang out. And I can remember seeing the side of President Kennedy's head come off, and I thought his ear came off. And I testified to that effect but years later I saw a picture that showed otherwise. But I can remember seeing a flash of white and the red blood. He went across the car seat over into Mrs. Kennedy's lap. And I can remember her hollering out 'Oh my God, no, they've shot Jack.'" And I turned to Gayle and said 'Gayle, that's it. Hit the ground' because at that time I thought the shots had come from straight over the top of our heads from behind." (When discussing a report received at WFAA saying the President was still alive) "I was kinda dumbfounded to hear these people saying that, when just minutes earlier I'd seen the side of his head come off." (When asked if he knew the President was dead when first interviewed on WFAA) "When you see something the size of a grapefruit or orange or something blow out into the air, and then you hear the statement that he was in the emergency and was shot in the back whatever, it dumbfounded me momentarily.." (When later asked about his impression the shots came from behind) "It was the visual impact that it had on me more so than the noise--seeing the side of the President's head blow off, seeing the President go across the car seat into Mrs. Kennedy's lap, in her direction. It gave me the impression that the shots were coming from directly behind where I was standing." (When stressing just how much his impressions of the shot location were based on what he saw as opposed to what he heard) "It might be difficult for me to testify that I heard a noise." (History Channel program "Our Generation", broadcast **2007**) "The President's car came toward us, probably some hundred feet or so from us, when the first shots rang out...I seen a bewildered look on President Kennedy's face...And when his limousine was straight out in front of us the third shot rang out...She (Jackie) hollered out "Oh my God no they've shot Jack" and I turned to Gayle and I said "That's it! Hit the ground!" (Pierce Allman, "Our Generation", broadcast **2007**) "A cop he got off his motorcycle and he said "everybody get down" and I bounced right back up and ran across the street and picked up Bill and Gayle Newman--I didn't know their names of the couple at the time--they had two little kids--and I said "Are you okay?" And he said "Yeah, but they got the President. They blew the side of his head in."

(Televised interview broadcast on KRLD, **11-17-08**) "As it got a hundred feet or so from us, the first two shots rang out. It was a boom, (slaps hands, waits about a second) boom (slaps hands), about like that." (Later) "As the car got in front of us, right here--like I say we was against the curb--the third shot rang out. I can recall seeing the side of President Kennedy's head fly off, seeing President Kennedy go across into Mrs. Kennedy's lap. And she hollered out 'Oh, my God, no, they've shot Jack.'" (The newsman then shows his viewers where the Newmans thought the shots had come from--not the picket fence, but the back of the arcade, near the west side of the book depository.) (**11-19-08** AP article by Dylan Lovan) "As the president's black convertible came into sight, Bill Newman said, he heard what he thought were fireworks. 'I didn't recognize it as a gunshot,' he said, clapping his hands twice with a pause to simulate the sounds. But as the limousine drew closer, Newman said he could see blood on Kennedy and Texas Gov. John Connally, who was in the car with the president. 'Ten, 12 feet in front of us, the third shot rang out, and that's when the side of his head flew off and I could remember seeing' the blood, Bill Newman said. 'I turned to Gayle and I said, that's it, hit the ground.' (When asked if he felt there was second gunman on the grassy knoll) 'I do tend to want to lean in the direction that it was a conspiracy, meaning more than one person was involved. But so far, no one's ever come forward with concrete evidence.'" (**11-22-08** article by David Flick in the Dallas Morning News) "With 45 years of

practice, Bill Newman repeats what he saw on Nov. 22, 1963, dispassionately and in quick order. After witnessing President John F. Kennedy's arrival at Dallas Love Field, he pressed the speed limit along Cedar Springs Road to get to his family to the parade route along Dealey Plaza. They arrived about five minutes ahead of the motorcade. As the presidential limousine approached, he heard a sound that he assumed was a firecracker, and then another. The president briefly raised his arms and then gazed out at the crowd with a bewildered look. A third shot. The president slumped into his wife's lap." (Tru TV program Conspiracy Theory, first broadcast **11-19-10**) "As the President's car turned onto Elm Street, probably some one hundred feet or less from us, the first two shots rang out, and it was BOOM (hits palm) BOOM (hits palm about a second later). Like that. Just as the car got right in front of us, the third shot rang out, and the side of President Kennedy's head blew off (as he says this he reaches for his temple). We seen the brain matter and the blood fly off. Mrs. Kennedy, she screamed out "Oh my God, they shot Jack." I turned to Gayle and said 'That's it, hit the ground.' We threw our children down and covered them on the ground. I thought the shot had come from directly behind (as he says this he points to the arcade at the top of the knoll). (At this point interviewer Jesse Ventura interjects "Directly behind?" Newman then confirms) "Directly behind." (A quick shot of the picket fence--which is 30 feet or more to the west of where Newman was pointing--is then shown.)

Analysis: Newman's statements demonstrate the necessity of grabbing eyewitness statements when fresh. While his statements have been consistent in many ways, in other, very important ways, they have changed. While he initially said the bullet impacted at the temple, within a few years it was blowing off Kennedy's ear. Similarly, while he initially heard one early sound, which he believed to be a firecracker, this sound eventually became two separate, well-defined BOOMS, and two firecrackers. Perhaps, as he became aware that most everyone, including his wife, had heard three shots fired, he re-interpreted the sound he initially thought was a firecracker, and convinced himself it was two shots. That he yelled to his wife and dived down to the ground after the head shot might account for his not hearing the final shot heard by so many others. Newman's purported statements to Bowles for the Kennedy Assassination Tapes are also interesting. Here, for the first and only time in his purported statements, there is a three second gap between the first two shots, plenty of time for Oswald to re-fire. Here, Newman's initial suspicion the shots came from behind him is based not on his aural and visual impressions, as stated in *The Men Who Killed Kennedy*, or his visual impressions alone as he would later insist, but on his suspicion Zapruder had a gun. As with the statements of the other unidentified witnesses in Bowles' book, liberties appear to have been taken. If this is so, however, Bowles was not the first nor the last to misrepresent Newman's statements. Conspiracy theorists, including the creators of 2010's Tru TV program Conspiracy Theory, have long pretended Newman's impression the last shot came from behind supports that the last shot or shots came from the picket fence. The picket fence was, at frame 313, when Newman developed his impression of the direction from which the shots were fired, directly to his right, and not directly to his rear. **Only heard two shots. First shot hit 190-224.**

Frances Gayle Newman: (**11-22-63** first interview on WFAA, prior to the announcement of Kennedy's death, at approximately 12:45) (When asked if she saw the blood) "Yes sir, it was awful." (When asked what her first thought was after the shots were fired) "I thought it was a firecracker and I saw the blood and I.....I had the baby and II just ran and we....I got on top of him and laid on the grass. I....I was....it scared me. It was terrible." (When asked what else she saw) "Governor Connally was kinda turned to the side and he grabbed his stomach." (**11-22-63** second interview on WFAA, at approximately 1:17 PM) "We were standing next to the curb so the children could see the President. And the car was just up apiece from us and this shot fired out, and I thought it was a firecracker, and the President kind of raised up in his seat. And I thought, you know, he was kind of going along with a gag or something. And then all of a sudden the next one popped, and Governor Connally grabbed his stomach and kind of laid over to the side. And then another one—it was just awful fast. And President Kennedy reached up (with both hands she reaches for her right temple) and grabbed--it looked like he

grabbed--his ear and blood just started gushing out. (She lowers her hands) And my husband said "Quick, get down" and I grabbed the baby and we ran and laid down on the grass and I got on top of him. It was just right by us when it all happened, just right in front of us." (When asked if she saw anybody) "It happened so fast that you didn't have the chance to see anything. It was just too fast." (11-22-63 statement to Dallas Sheriff's Department, 24H218) "When President Kennedy's car was about ten feet from us, I heard a noise that sounded like a firecracker going off. President Kennedy kind of jumped like he was startled and then covered his head with his hands and then raised up. After I heard the first shot, another shot sounded and Governor Connally kind of grabbed his chest and lay back on the seat of the car. When I first saw and heard all this, I thought it was all of a joke. Just about the time President Kennedy was in front of us, I heard another shot ring out and the President put his hands up to his head, I saw blood all over the side of his head. About this time, Mrs. Kennedy grabbed the President and he kind of lay over to the side kind of in her arms. Then my husband, Billy, said it is a shot. We grabbed our two children and my husband lay on one child and I lay on the other one on the grass. We started to get up and then all of a sudden we lay back down. I don't know what it was but another shot may have been fired that caused us to lay back down." (11-24-63 FBI report, 22H842) "She estimated that when the limousine bearing the President was about 50 feet from them she heard 2 reports and the President seemed to rise up in his seat. A few seconds later she heard another shot and saw that the President had been hit in the head because she saw blood flowing from his body. She believed there were first two shots in succession, a pause, then another shot was fired which struck the President... After the shots were fired, she and her husband each grabbed a child and lay down on the grass fearing they might be hit by gunfire."

(2-15-69 testimony in the trial of Clay Shaw) "The President's car was maybe 100 or 150 feet from us when I first heard the noise and the first two noises were close together, just seconds apart... at the time of the first noise he threw his hands up... He threw his hands up like this and sort of turned his head... I saw Governor Connally with the first shot seemed to turn a little bit like this. (Indicating)... at the time of the second shot Governor Connally grabbed his stomach... his eyes just got real big and he sort of slumped down in the seat... we heard a third report, it was a short time, not maybe 10 or 12 seconds after the first two shots... that shot when it happened, the President's car was directly in front of us and it was about a lane's width between us, it wasn't in the lane next to the curb it was in the middle lane, and at that time he was shot in the head right at his ear or right above his ear... The President, his head just seemed to explode, just bits of his skull flew in the air and he fell to the side." (Interview in The Men Who Killed Kennedy, broadcast 1988) "The first two shots I didn't realize what they were but the third shot, after it was fired, I heard Mrs. Kennedy scream "Oh no! They shot Jack!" And it just sorta put a chill over you. It was just terrible." (Excerpt from 1991 interview with Mark Oakes, found online) "When he was shot,(?) stuff flew up (motions to right temple) and blood started coming out of his head. And he fell over into Mrs. Kennedy's lap." (Interview with Texas Monthly, November 1998) "as the car turned the corner and came towards us, we heard a noise. I thought it was a firecracker. And the people in the car reacted, especially President Kennedy. He threw his hands up, I thought he was going, you know, going along with a bad joke... Then, as they got closer to us, directly in front of us, when the other shot that (was) shot, you know, the side of his head, you could see the white matter coming out of his head, then red, and we heard her (Jackie) holler, "Oh my God, no, they shot Jack!" And Bill turned to us and he said, "That's it. Put the children on the ground." We put the children on the ground and shielded them with our bodies because we thought we were in, you know, direct crossfire." (Oral History for the Sixth Floor Museum, 7-10-03) "The first two shots sounded like firecrackers to me. I'd never been around gunfire so I had nothing to compare it with but the way he reacted I thought that man's got a sense of humor--y'know, someone doing something like that in such bad taste. And then as the car approached and got directly in front of us that third shot rang out, and just the visual--you could see bits of flesh flying in the air, a white mass and then red coming out of his head (during this last

sentence, she placed her hand by her right ear). I heard Jackie Kennedy scream out also and we turned and put the children on the grass behind us and shielded them with our bodies." (When asked if she thought the President was dead) "I wouldn't think that anybody could live with the side of their head (at this point she fluttered her fingers over her right ear)...I mean, if you'd have seen it there would be no doubt in your mind that he was dead." (When later asked if she shared her husband's impression the shots came from behind) "Yes, mine is just visual. Y'know, the impact at the side of his head, and the way he fell over. Just visual." (Televised interview broadcast on KRLD, **11-17-08**) "I thought it was firecrackers. I'd never been around gunshots or gunfire at all in my life." (Later) "I was scared that something might happen to my children. Y'know I didn't know if we were gonna be in a crossfire, what was gonna happen." (On the third shot) "When that happened Bill turned to me and he said 'That's it! Hit the ground.' And so we turned and put the children on the ground and shielded them with our bodies." **Analysis:** Gayle Newman clearly saw the President wounded by the first shot. She then heard two more shots, associating one with the wounding of Connally, and one with the head wound on Kennedy. As the Newmans are about the only witnesses to note Connally's wounds before the head shot, their recollections are strong arguments against the rare but resilient theory that Connally was hit by a shot fired after the head shot. As Mrs. Newman was both one of the first people to comment on the shots, and one of the closest witnesses, her fresh recollection that the shot after the shot striking Connally came "awful fast" is also a strong argument against the LPM scenario, in which these shots are five tension-filled seconds apart. Still, as her latter statements reflect she thought the head shot was further from the shot striking Connally than the Connally shot was from the first shot, it's hard to avoid concluding her recollections are fairly unique, in that she seemed to think the the first two shots were bunched. **First shot hit 190-224. First two shots bunched together. Possibly originally believed the last two shots were bunched together.**

Up Close and Even More Personal

At left: a frame from the Muchmore film, with the Newman family on the far side of the limousine, and Beverly Oliver and Charles Brehm in the foreground.

Above: Z-298, with Jean Hill in red, Mary Moorman in blue, and a woman believed to be Toni Foster in tan.

At left: the Bond photo depicting the aftermath of the shooting. Cheryl McKinnon can be seen crouched down on the ground to the east of the Newmans.

Above: the Hesters as depicted in the Wiegman film

Up Close and Even More Personal

There are still more prime witnesses, people whose lives were forever changed by their experience. One or more of these persons, however, may not be who they say they are.

Francine Burrows was purported by Gerald Posner in 1993 to be the woman in a tan jacket running north towards Kennedy in the Zapruder film in the frames leading up to the head shot. (3-6-92 interview with Gerald Posner, reported in *Case Closed*, 1993) “She (Burrows) ran across the grass to get closer to the President. In the Zapruder film, she is seen in a beige raincoat, running toward the limousine neat the point of the fatal head shot, and has never been identified until now. Burrows was within twenty-five feet of JFK when he was shot and was also looking directly at the grassy knoll. She saw nothing there. Instead, she remembers three shots, and says, “I was very close to him when he got shot. And I looked up at that window immediately...I knew instinctively that’s where the shots came from.” **Analysis:** if this is the woman in the film she is nowhere near twenty-five feet from Kennedy at the moment of the head shot, as Posner claims, but forty to fifty feet away at the closest. As we are not allowed to read all that she had to say, an accurate evaluation is difficult, however. While Posner boasts she heard three shots, as a way of cutting off speculation that more than three shots were fired, he doesn’t let us read how the shots sounded, or when she heard them in relation to where she was in the film. It is highly doubtful that the woman in the film, who, in Posner’s theory had continued to run towards the President for five seconds after hearing the second shot, knew shots were being fired prior to the head shot, and yet Posner wants us to believe that at the moment of the head shot, she immediately knew that all the shots had come from the school book depository. It seems quite possible she heard one or more shots just before or after the head shot, and that Posner trimmed her words to hide this fact. **Too vague.**

Toni Foster is a woman claiming to be the same woman that Posner claims is Francine Burrows. Unlike Posner, when researcher Debra Conway publicly identified Foster as the “Running Woman,” she had the good sense to publish pictures of her. There is, indeed, a resemblance to the woman seen in the Zapruder film. (2000 article in the *Kennedy Assassination Chronicles*) “I heard two firecracker-like sounds and I looked up because it sounded like it was coming from up in the air. At the time, I thought, “Those sound like firecrackers.” To me it was click-click; they were just that fast. As I thought that and I looked towards the president I didn’t know he was already shot. Because when I did look at him that’s when the third shot hit and his head went down like that (puts her head to her chest). I looked at him, I noticed he took his hands and did like this (brings her hands up and crossed at her chest), his head came down. I thought, “I wonder what he’s doing? Why did he do that?” As I’m thinking that—that fast—the 4th shot, the last shot, hit and his head exploded. So to me it was four shots. I do recall after that, the shell, I could hear that clink. And I remember everything stopped for me. I remember (his head) looked like confetti, it was just blown off. It hit him back here (puts her hand on the right rear of her head) and it was just like confetti. The spray went behind him. I do believe from what I heard and what I saw the shots came from the back. Now this whole thing was a shock but that’s how I feel, what I heard and what I saw—they were coming from the back...For some reason the car stopped. It did stop for seconds. I don’t even know why it stopped and all of a sudden it sped up and they went under the underpass. I could never figure out why the car stopped.” **Analysis:** Foster has more credibility than Burrows, if only because Ms. Conway allows her to have more credibility. Although Foster says she heard four shots, she says she believed they all came from behind. She also says the spray went to the back, which is inaccurate, but would have been how the spray appeared since the limousine was in motion. Where she is almost certainly wrong is in her recollection of three shots before the head shot, and two missed shots at the beginning, something no one else, save another controversial witness, Beverly Oliver, seems to remember. **Heard four shots. Three early shots.**

Mary Moorman was on the south side of Elm across from the Newmans, and to the east of Toni

Foster. She can be seen in the Zapruder film, Nix film, and Muchmore film, as well as stills such as the Bond photo. She took a picture of Kennedy a split second after the impact of the head shot. (11-22-63 article in the Dallas Times-Herald) "Mrs. Moorman, who snapped a picture just at the time the President was shot, and said: 'I took the picture exactly at the moment the shot rang out. My Polaroid shows Kennedy slumped over in the car and it shows Jackie leaning towards him. I heard Mrs. Kennedy say 'My God, he's been shot.' I heard another shot or two and I turned to my friend and we got on the ground.'" (3:16 PM 11-22-63 WBAP TV interview, available on Youtube) (When asked why she took the photo at that moment) "That was the only chance I had. Mine is a Polaroid and I can only take one every ten seconds, and that was at that time whenever I took it. (When asked if she'd realized he'd been shot when she took the picture) "No I didn't. I must have snapped it immediately when he slumped, cause in the picture that's the way she's there and he's slumped over." (When asked if she'd seen the shooter) "No, I had taken the picture. And then the shots. And I decided it was time to fall on the ground." (3:30 PM 11-22-63 KRLD interview, as transcribed by David Lifton and posted on the Education Forum, 6-30-11) (When asked if she took her Polaroid picture before or after the first shot) "Evidently, just immediately, as the... Cause he was, he was looking, you know, whenever I got the camera focused and then I snapped it in my picture, he slumped over." (When asked how far away she was from Kennedy at this time) "10 or 15 foot, I, no, more (unint) because I fell behind my camera." (When asked where she was standing) "Just a few feet from the underpass" (When asked if she was by the grassy bank) "Yes, that's where we were and I stepped out in the street. We were right at the car." (When asked if she saw any suspicious persons) "Yeah, of course, I have, I was just uh you know (unclear word) my camera, and when I took that the shots had rang out, and I wasn't looking around." (When asked how many shots she heard) "Oh, oh, I don't know. I think three or four is what I, uh, that I heard...that I'm sure of. Now, I don't know, there might have been more. It just took seconds for me to realize what was happening. (When asked Kennedy's response to the first shot.) "He grabbed his chest, and, of course, Mrs. Kennedy jumped up immediately and fell over him, and she said "My God, he's been shot." (When asked the reactions of others) "Uh, they hesitated just for a moment 'cause I think they were like I was, you know—"Was that a shot or was it just a backfire, or just what?" And then, of course, he clutched himself and they immediately sped up, real fast, you know, like to get out of there. And, uh the police, there were several motorcycles around him, and uh, they stopped, and uh—one or two must have went with him. And one ran up the hill, and a friend that was with me ran up the hill across the street, from where the shots came from." (When asked if the shots sounded loud) "Yes, they did. Just like a firecracker going off..." (When asked if they seemed close by) "Yes, uh huh." (When asked where the shots came from) "Oh, (unintelligible, 'Lord' or possibly 'North') Just back there." (When asked if this meant the shots were fired toward her) "Yes, sir... The sound popped, well it just sounded like, well, you know, there might have been a firecracker right there in the car." (When asked again if her picture was taken before the shot) "Evidently, at the minute that is, that it hit him because, uh, he was, he was looking, at me, or I mean, he was looking, you know, at the people when (or "whenever") my picture came out. They just, just slumped over, so I must have got it. (words, unintelligible)." (When asked if this is shown in her picture) "Yes, uh huh. You could (unint) he's clutched. He's bent over, and she's...and she hadn't even gotten up in my picture, and she did get up, stood up, in the car."

(11-22-63 WFAA interview, as quoted in Pictures of the Pain) "My picture when I took it was at the same instant that the President was hit, and that does show in my picture...it shows the President, uh, he slumped...It all happened so suddenly, I don't think anyone realized, you know, what had happened." (About the shots) "There was three or four real close together, and it must have been the first one that shot him, 'cause that was the time I took the picture, and during that time after I took the picture, and the shots were still being fired, I decided I better get on the ground. I was no more than 15 foot from the car, and in the line of fire, evidently." (11-22-63 statement to Dallas Sheriff's Department,

19H487, 24H217) "As President Kennedy was opposite me, I took a picture of him. As I snapped the picture of President Kennedy, I heard a shot ring out. President Kennedy kind of slumped over. Then I heard another shot ring out and Mrs. Kennedy jumped up and said "My God, he has been shot!" When I heard these shots ring out, I fell to the ground to keep from being hit myself. I heard three or four shots in all." (11-23-63 FBI, report, 22H838) "She took a second photograph of the President as his automobile passed her, and just as she snapped the picture, she heard what she first thought was a firecracker and very shortly thereafter heard another similar sound which she later determined to have been gunfire. She knows that she heard two shots and possibly a third shot. She recalls seeing the President sort of "jump" and start to slump sideways in the seat, and seems to recall President Kennedy's wife scream "My God, he's been shot!...She recalls that the President's car was moving at the time she took the second picture, and when she heard the shots, and has the impression that the car either stopped momentarily or hesitated and then drove off in a hurry." (Interview with CBS, aired 9-27-64) "I stepped out into the street. So, I took the camera and aimed it, uh, focused it. And I stood there and looked through it for quite a few seconds, since I wanted to be sure that they were looking at me. And uh, I followed it, for, oh, so many seconds, and then I did take the picture."

(2-15-69 testimony in the trial of Clay Shaw) "as the Presidential limousine approached me I stepped forward to observe closer in order to take a picture, that is what I planned to do and just what I did....I heard three noises and they sounded like firecrackers." (1997 interview on KRLD, as posted online by Debra Conway) "Uh, just immediately before the presidential car came into view, we were, you know, there was just tremendous excitement. And my friend who was with me (Jean Hill) we were right ready to take the picture. And she's not timid. She, as the car approached us, she did holler for the president. 'Mr. President, look this way!' And I stepped out off the curb into the street to take the picture and snapped it immediately. And that evidently was the first shot. You know I could hear the sound. and..." (When asked if she recognized it as a rifle shot) "Oh no. A firecracker, maybe. There was another one just immediately following which I still thought was a firecracker. And then I stepped back up on to the grassy area. I guess just, people were falling around us, you know. Knowing something was wrong. I certainly didn't know what was wrong". (Appearance in Discovery Channel program Unsolved History: Death in Dealey Plaza, first aired 2-26-2003. Transcript provided by James Fetzer) (Moorman is standing on the grass where she is seen in the Zapruder film) "I just stepped to the, uh, to the edge here, and Jean is hollering, "Look Mr. President, look our way!" and then I snapped the picture, which was at the same instant, evidently, as the bullet hit him, not realizing that's what had happened. But I did hear a noise, and then I could see people around me falling to the ground, or running, and doing--and that led me to know that something was happening." (April, 2007 interview on KRLD) (When asked how many shots she heard) "I heard three." (When asked what they sounded like) "I stepped up to snap a picture and at the instant that I snapped a picture there was a shot. And I know I stepped back a few steps and another shot. And then there was another one shortly in a matter of seconds...The first two were closer together than the last one." (News interview found on youtube, in which Moorman discusses deciding to sell her photograph, 2008) "My thought was those are firecrackers, not shots." (When discussing her photograph) "It just so happened it was the same instant that he was hit. And that was the first shot." (On the possibility there was a shooter in front of Kennedy, on the knoll) "Whether there was or not, we may not ever know."

(5-24-11 interview conducted live on iantique.com) (When asked if she'd stepped out into the street to take a photograph of motorcycle officer McBride, before Kennedy's arrival) "Yes." (When asked if she'd stepped out into the street to take a picture of a second motorcycle officer, George Lumpkin) "Yes, I did, because he was in the middle of the street." (When describing the shooting) "I had been in the street to take the picture of Lumpkin. When the limousine turned the corner, it was coming towards me and I focused--I don't know if I focused--but I looked in the camera to watch the car as it approached, and uh looking up the area, waiting for him to get close enough and Jean hollered 'Mr.

President look this way, we want to take a picture!' As I thought he was where I wanted it to be, I snapped the picture. And at the same time I snapped the picture I heard a sound. And I just uh, I had my picture taken, I was not holding the camera in front of my face. And I heard two more sounds, which I thought were firecrackers." (When asked if she'd stepped into the street to take the photo of Kennedy) "I'm pretty sure that I had stepped back just onto the very edge of the curb, to get off the street, onto the grass." (When asked again about the first shot) "I heard that while the camera was still up in my face. I heard a noise. I heard a sound." (When asked about this shot in comparison to her taking her picture.) "At the same time... Seconds or...awfully quick." (When asked if she heard a second shot.) "I did. Immediately. It was like Pow...Pow Pow. Y'know it was that quick. And, this second shot, I was looking at this man, and my thought was 'I saw his hair jump.' Well, it was his head, y'know, the hair." (When asked if she thought he'd been hit by the first shot) "Yes." (And the second shot.) "Not sure about the second shot other than that I did see something happen to him." (When asked about a third shot.) "I heard three shots." (When asked to confirm that she didn't hear the two shots prior to the head shot described by most writers) "That's right. I guess not. And if there was a first shot, I don't think I would stand there and then take a picture, knowing that I'd heard something." (When asked if she could have been mistaken about the sounds.) "Well, yes, I thought they were firecrackers. I did not know there was a gunshot, no." (When asked if the motorcycles had been backfiring) "No." (When asked if the limo slowed down.) "It slowed down almost if not to a stop, and I saw Jackie. She hollered 'Oh, my God, he's been shot!' I heard that. And I saw her start to climb out over that car." (When asked when the limo slowed down) "After all the shots. There was no more shots." (When asked if she had a sense where the shots had come from.) "I did not." (When asked if she'd seen any shots hit the windshield.) "No, I did not. (Or the pavement.) "No, I did not." (When asked if she had a sense that some of what she'd heard were echoes.) "No, I didn't. I'm not accustomed to hearing shots." (When asked about Jean Hill's claim in her book that a SS agent stole Mary's photos from her--Jean Hill's--pocket.) "It didn't happen." (When asked whether Jean Hill had ever mentioned to her that she'd seen smoke or a man with a rifle on the grassy knoll--as she was later to claim.) "No, she did not." (When asked if she'd noticed anything on 11-22-63 that she now considers suspicious.) "I have no idea." (When asked why she didn't testify before the Warren Commission) "I just told them that I'd turned my ankle and couldn't go, and I never heard from them ever again." (On whether she thinks the Zapruder film coincides with her recollections) "Not really. I appreciate it...It does show that I was there." (If she has an opinion on whether there was more than one shooter.) "No. But I believe there's a whole lot more to the story than what's been told. I don't know about how many shooters or don't really care other than to know for sure what's happened." **Analysis:** as Mrs. Moorman took her famous Polaroid at frame 315, the first shot she heard would have to have been the head shot. She then describes a shot after this, but before she heard Jackie yell out. In this she is probably mistaken, as Skelton and Summers and her friend Jean Hill remember Jackie yelling out just before this shot. While she has been inconsistent on the number of shots she heard, she has been consistent in that the first shot she heard was the shot captured in her photo (at frame 315) and that she heard another shot (or two) just after this shot. **Did not hear the first shot. Last two shots (or more) bunched together (with the last shot after the head shot).**

Jean Hill, the woman in red in the Zapruder film, stood just east of her friend, Mary Moorman, who wore blue. (Peter Whitmey's excellent article on Hill, *The Lady in Red*, provided a number of the quotes.) (11-22-63 WBAP radio interview, first played around 1:10 PM, and then repeated around 1:21. This was also played on WBAP TV, apparently around 1:15.) "the shots came directly across the street from us, and just as the President's car became directly even with us...he and Jackie were looking at a dog that was in the middle of the seat, and about that time two shots rang out just as he looked up—just as the President looked up and these two shots rang out and he grabbed his chest, looked like he was in pain, and he fell over in his seat. And Jackie fell over on him and said "My God, he's been shot!" After that more shots rang out and the car sped away...the shots came from the hill...it was just east of the

underpass...(when asked if she saw anyone) I thought I saw this man running but I looked at the President and, y'know, for awhile, and I looked up there and I thought I saw a man running and so right after that--I guess I didn't have any better sense--I started running up there, too." (11-22-63 statement to Dallas Sheriff's Department, 19H479, 24H212) "The President's car came around the corner and it was over on our side of the street. Just as Mary Moorman started to take a picture we were looking at the President and Jackie in the back seat... looking at a little dog between them. Just as the President looked up toward us two shots rang out and I saw the President grab his chest and fall forward across Jackie's lap and she fell across his back and said "My God, he has been shot". There was an instant pause between the first two shots and the motorcade seemingly halted for a second and three or four more shots rang out and the motorcade sped away." (11-22-63 article in the Dallas Times-Herald) "Mrs. Jean Hill...said the motorcade stopped suddenly then swiftly sped on with the sirens blowing. 'I thought I saw someone in the motorcade in street dress shoot back at a person running up the hill. The motorcade kept on going at the usual rate of speed for a second and then sped up. Some of the motorcycle policemen sped up and some stopped. I didn't see anyone get in the car with the President. I didn't see anyone else in the car. I kept looking at the President. I couldn't see any blood.'" (11-22-63 article in the Dallas Times-Herald--presumably published later that afternoon and as quoted in Hill's subsequent book, JFK: The Last Dissenting Witness) "Jean Hill, of 9402 Bluff Creek, and her companion were eyewitnesses to the shooting of President Kennedy in Dallas Friday. Both heard a sequence of shots, saw the President slump over to his wife, heard the piercing scream of Mrs. Kennedy. They glanced up to see a man run up the hill across the street from them..." (On what happened after the first shot) "Then the President looked up and just about that time he grabbed himself across the chest and looked like he was in pain. He fell toward Jackie across the seat. She said 'My God, they've shot him,' and she fell across him. I would say about six shots rang out and everybody started screaming and falling down..." (11-22-63 WFAA interview, several hours after the shooting, as found on youtube as "JFK Assassination rarely seen 22nd November 1963 Jean Hill interview") "The President and Mrs. Kennedy were in the back seat. They had a little dog between them. Looking at it. And just as the car came right in line with us, the President looked up and just as he looked up two shots rang out and he grabbed his chest and this real odd look came over his face and he pitched forward onto her lap. And she jumped up over him and screamed and said "My God, he's been shot!" And there was just an instantaneous, sort of an instant pause in the motorcade. It momentarily halted. And three or four more shots rang out and they sped away real quickly." (Later) "When I saw the look come across his face, I knew that he'd been hit." (3:16 PM 11-22-63 WBAP TV interview, available on Youtube) "Just as Mary started to take the picture and the President came right even with us, two shots-- we looked at him and he was looking at a dog in the middle of the seat—two shots rang out. And he grabbed his chest, and a look of pain on his face, and he fell across towards Jackie, and she fell over on him and said "My God, he's shot!" And there was an interval and then three or four more shots rang out. By that time the motorcade had sped away." (When asked if she saw the shooter) "No, I didn't see any person fire the weapon...I only heard it. And I looked up and I saw a man running up the hill." (When asked if she knew what had happened) "No, I had no idea. I had nothing to go by. I don't think it dawned on me for an instant that the President had been shot. I mean I knew and yet it just didn't register."

(3:30 PM 11-22-63 KRLD interview, as transcribed by David Lifton, and posted on the Education Forum, 6-30-11) (When asked if she was 10-15 feet from the limousine, as described by Mary Moorman moments before) "Not anymore than that at all...we were looking right at the President. We were looking at his face. As Mary took the picture, I was looking at him... And he grabbed his hands cross his ch--when two shots rang out. He grabbed his hands across his chest. I have never seen anyone killed, or in pain before like that but there was this odd look came across his face, and he pitched forward onto Jackie's lap. And, uh, she immediately, we were close enough to even hear her, and

everything, and she fell across him and says, "My God, he's been shot"... (When asked if she'd noticed the people around her) "There was no one around us on our side of the street. We had planned it that way; we wanted to be to be down [there] by ourselves. That's the reason we had gotten almost to the Underpass, so we'd be completely in the clear." (When asked the response in the motorcade) "The motorcade was stunned after the first two shots, and it came to a momentary halt, and about that time 4 more uh, 3 to 4 more shots again rang out, and I guess it just didn't register with me. Mary was, huh, had gotten down on the ground and was pulling at my leg, saying "Get, get down, they're shooting, get down, they're shooting, and I didn't even realize it. And I just kept sitting there looking. And just about that time, well, of course, some of the motorcycles pulled away. And some of them pulled over to the side and started running up the bank. There's a hill on the other side... And the shots came from there... After they were momentarily stopped—after the first two shots... then they sped away real quickly." (11-23-63 FBI report, CD5 p35) "she heard something like a rifle shot and observed President Kennedy crumple in his seat in the automobile. She was standing nearby, as the vehicle was passing the spot where she stood at the time." (Interview in Rush to Judgment, filmed 2-18-64) "the consensus of opinion... down there at the quarters was that there had been only three shots... they kept sayin', are you sure it wasn't echoes?" (3-18-64 FBI report, 25H853) "She stated that President Kennedy was looking down when she shouted and when he turned to look at her a shot rang out and he slumped towards Mrs. Kennedy... Mrs Hill heard more shots ring out and saw the hair on the back of President Kennedy's head fly up... she heard from four to six shots in all and believes they came from a spot just west of the Texas School Book Depository. She thought there was slight interval between the first three shots and the remaining shots." (3-24-64 testimony before the Warren Commission, 6H205-223) "We were standing on the curb and I jumped to the edge of the street and yelled "Hey, we want to take your picture" to him and he was looking down in the seat—he and Mrs. Kennedy and their heads were turned toward the middle of the car looking down at something in the seat, which later turned out to be roses... as I yelled "Hey" to him, he started to bring his head up to look at me and just as he did the shots rang out. Mary took the picture and fell on the ground and of course there were more shots... I have always said there were some four to six shots. There were three shots, one right after the other, and a distinct pause, or just a moment's pause, and then I heard more."

(1978 interview with Anthony Summers, as recounted in Conspiracy, 1980) "'I heard four to six shots, and I'm pretty used to guns. They weren't echoes or anything like that. They were different guns that were being fired... The President was killed and then, of course, pandemonium reigned..and I looked up, and at the time I looked up across the street I saw smoke like from a gun coming from the parapet, that built-up part on the knoll.'" (Spring, 1987 conversation with Cyril Wecht, as recounted in Wecht's book Cause of Death, 1993) "'I was staring directly at the grassy knoll area when the shots went off,' Jean told me... 'As soon as I heard the shots, I focused completely over that way because that's where I thought the shots came from,' Jean said. 'I saw two men holding guns. One was behind the picket fence. As soon as the shots were fired, the men began fleeing, and instinctively, I started following them.'" (November, 1988 article by Edward Oxford in American History Illustrated, built upon an interview with Hill) "There was a flash of light from the grassy knoll. I thought it was the good guys and the bad guys. Shots from the back. Then..shooting from the front. I believe I heard four to six shots in all. Mary tried to pull me to the ground. I stood there. I wanted to find out what was happening. People seemed frozen at first. Then I noticed one man, though, moving from the front of the Depository building, hurrying towards that parking lot behind the grassy knoll. He had on a hat and an overcoat. I went back there looking for him. Then a guy in plain clothes came up to me and flashed some I.D. on me. He said he was with the Secret Service. He said, 'You need to come with me' - and took me over to the Sheriff's office to question me." (Interview in TV special Who Murdered JFK?, first broadcast 11-2-88) "I saw a man moving. He was the only thing in the whole area that was moving. And he was moving away-- toward the tracks--from in front of the school book depository, rather quickly. And something said to

me 'Go get him.'" (11-22-88 televised interview with Geraldo Rivera) (When asked why she raced up the knoll) "As the series of shots rang out, I thought I saw someone firing from the grassy knoll, from the fence behind there." (After being reminded that the Warren Commission had concluded no shots were fired from the knoll) "I heard the shots ringing out. I looked -of course -I was looking around. My friend Mary got down on the ground and said 'Get down, they're shooting.' But I was too caught up in the moment and all this is taking place so quickly. And there was a rifle blast from behind the fence on the grassy knoll." (Interview with Jim Marrs recounted in Crossfire, published 1989) "I knew he'd never look our way because all the other people were on the other side of the street, so I jumped out in the street and yelled, 'Hey, Mr. President, look this way. We want to take your picture.' As he began turning toward us, he was hit. Then a bullet hit his head and took the top off. Mary fell to the ground and shouted, 'Get down, they're shooting!' But being young and dumb, I kept standing for a minute trying to see where the shots came from. It was eerie. Everything seemed frozen. I saw a man fire from behind the wooden fence. I saw a puff of smoke and some sort of movement on the grassy knoll where he was."

(11-16-91 AP article on the 1991 ASK assassination conference found in the Victoria Advocate) "Jean Hill, a schoolteacher playing "hooky" that November day, said she yelled "Hey. Mr. President, I want to take your picture." Then shots rang out. "I thought there was more than one shooter," she said." (11-17-91 Dallas Morning News article by Todd Copilevitz on Hill's appearance at the ASK conference) "Ms. Hill, a third-grade teacher from H.S. Thompson Learning Center, told of persuading a police officer to let her and a friend stand in the median so they could get a better look at the president. 'Well, actually there were a couple cute motorcycle officers that we were interested in, and they couldn't see us if we were in a crowd,' she said. The two women were looking at the book depository and the grassy knoll on Elm Street west of the depository - where conspiracy theorists believe the fatal shot came from -when the shots started to ring out. Ms. Hill insists that she saw two gunmen, including one who was firing from behind a picket fence on the knoll. She decided to chase one of the men as he ran, but two men in trench coats grabbed her by the shoulder and instead took her to the Dallas County Records Building. There, she said they disputed her account of hearing four to six shots, and then issued a stern warning: 'You would be very wise to keep your mouth shut,' she recalled one of the men telling her. 'I never have been that wise, I guess.'" (11-21-91 Dallas Morning News article on a showing of Oliver Stone's JFK) "Also at Prestonwood, assassination eyewitness Jean Hill answered questions from moviegoers and signed autographs. Ms. Hill stood on Elm Street across from the Texas School Book Depository when the shooting occurred. She was one of numerous witnesses who said they saw shots from a grassy knoll west of the depository building. 'I'm the one who named it "the grassy knoll," too,' she said." (December, 1991 appearance on the Maury Povich Show) "We got caught up in it and I dashed out to the edge of the street, and I started to touch the car, and you just don't do things like that. And I yelled "Hey, Mr. President...And just as he started to turn and look at me, and his hand came up, I thought, to wave, then all of a sudden the shots rang out and he grabbed his throat. And it was just horrible. There was a series of shots, and I saw the flash of light and a puff of smoke from the knoll in front of us" (When reminded by Povich that the Warren Commission said no shots came from there) "Oh, I saw it...Oh, I did...I know someone was shooting from there." (When asked how far she was from the car) "Oh, at one time I could have touched the car." (When asked how far she was when the shots were fired) "I had jumped back up on the curb, just a little further than I am from you." (Which would be about 3 feet) (When asked if she'd seen a man) "I just saw the smoke and the light from the knoll where I knew someone had shot. And at that instant, his head was blown off. And the blood and the brains and all that, this made a red cloud around Mr. Kennedy's head. And the blood and everything splattered my boyfriend's motorcycle. And it was just horrible. It was something you never forget. I just saw this look in his eyes that, and his head was gone." (When asked about seeing a man) "And I looked up and I saw this man right in front of me at the top of the hill, and he was walking very fast back to where I had

seen the gun--(correcting herself) had seen someone shooting, and I thought 'He's getting away.' And there were so many--and the shots were ringing out. I said at least four to six...I'd heard that many, but I thought it was just the good guys and the bad guys shooting back, and I thought "You must be a bad guy because you're running away, and we're not. And I thought 'I've gotta catch him. Somebody's gotta catch him.' I ran across the motorcade, and ran up on the hill back into the parking lot, looking for him. And when I got up there, a man grabbed me from behind on my shoulder--he had an extremely painful grip--and said 'You're coming with me.' And I said 'I can't. I've gotta catch this man. Help me.' And he had shown me some ID. Secret Service...I jerked away from him twice. But about the time I jerked away the second time, another man came and grabbed this side and they had me held--it was so painful...And he just said 'I want your pictures'...I told him I didn't have any...And he just ran his hand in the correct pocket and came up with my pictures...They told me to walk and act as though we're your boyfriends...and they took me into this place in the Records Building, Courts Building, up on about the fourth floor. And they just opened a door and shoved me in there, and there were these men sitting there at a table at a window overlooking--it was like a theater seat--and you could see the whole thing, the whole assassination site." (**December, 1991** appearance on the Today Show, as recounted by Peter Whitney in his 1994 article The Lady in Red) (When asked what she saw) "someone shooting from the knoll, from back behind the fence..a flash of light and a puff of smoke."

(**1-22-92** appearance on The Oprah Winfrey show) (A scene is played from the movie JFK, in which the woman playing Hill claims: "And then shots rang out. Mary fell to the ground right away. She yelled they're shooting, they're shooting get down. I just stood there watching. Then out of the corner of my eye, I saw a flash of light in the bushes and that last shot just ripped his head off. I looked up and I saw smoke coming from over there on the knoll." Hill is then asked to describe the shooting.) "Well it's exactly like he portrays it in the movie. The motorcade comes around. I did see the flash of light, the puff of smoke, at the moment the President's head was ripped off." (Oprah then asks "Over on the...") "The grassy knoll, which I, by the way, named it." (Interview with James Earl Jones in the television production The JFK Conspiracy, **Spring, 1992**) "Just as my friend started to take a Polaroid picture of the President, as his car was coming abreast, the shots rang out. I mean, I'd jumped out into the street to yell at him to look this way, and shots rang out. He grabbed his throat, and that was the horrible head shot." (When asked how many shots she'd heard) "4 to 6." (When asked if she'd seen a gunman) "I saw smoke, a puff of smoke, and a flash of light from the knoll, where someone was shooting from behind the fence." (JFK: The Last Dissenting Witness, **1992**, co-written with Bill Sloan) "Hey, Mr. President," Jean shouted impulsively when the car was almost abreast of her. 'Look Over here. We want to take your picture.' In her desperation and excitement. she stepped off the curb into the street as she spoke, almost touching the front fender of the limousine before she instinctively drew back...What a great picture this is going to be, Jean thought, as Mary raised her camera. She sighted through the viewfinder, and... CRACK!...almost simultaneously, Jean heard a shot. Mary hesitated as an expression of pain and confusion crossed the president's face. His hands jerked convulsively toward his throat. CRACK! Jean saw the president driven backward and sideways as a second shot struck him with tremendous force. The whole back of his head appeared to explode and a cloud of blood-red mist filled the air and splattered on the windshield of J.B.'s motorcycle. Approximately an eighth of a second later (as investigators would later determine), as the President was falling toward his wife, Mary clicked the shutter of the Polaroid. Then Jean heard Jackie Kennedy's anguished cry: 'My God, they've shot my husband!' ...'Jean, get down!' Mary screamed, as she and the other panicked bystanders nearby threw themselves to the ground...Jean stood there, immobilized by the shock of what she had seen, while her friend tugged desperately at her legs. On the other side of the street, at the top of the little green mound universally known today as the 'grassy knoll,' Jean had seen an incredible sight...A muzzle flash, a puff of smoke, and the shadowy figure of a man holding a rifle, barely visible above the wooden fence at the top of the knoll, still in the very act of murdering the president of the United States." (**6-28-92** article in

the Baton Rouge Advocate on a promotional appearance by Hill at a bookstore) "Hill still recalls those historic moments of horror when she was standing just a few feet from the limousine carrying President John Kennedy, Jackie Kennedy and Texas Gov. John Connally. She has replayed the scene in her mind's eye countless times: calling out to Kennedy to get him to turn his head so her friend, Mary, could snap his picture; Mary snapping the camera just as a bullet struck the President's head, spraying blood and brain tissue in a fine mist over the occupants of the car and the windshields of the motorcycle patrolmen following closely behind the limo. Hill pointed to her image in the Orville Nix photo of the moment Kennedy was shot. She was to the left of the car, which was moving to the left. To her right, directly behind the car, was the school book depository. She said she clearly saw a man across the street, in the direction toward which the car was moving, firing a rifle at the President--from the front. Everybody else was diving for the protection of the ground; Hill set off to see who was shooting at the President. "I don't know why I did that," she said...When she reached the fence on the other side of the grassy knoll, she saw a policeman holding a rifle. She thought that was odd, since no other police officers had rifles, but she assumed people in uniforms were good guys--and this man with the rifle was therefore a good guy." (Interview in documentary Beyond JFK, **1992**) "I jumped out in the street, and, y'know, started yelling at him 'Hey, Mr. President, look this way. We want to take your picture.' And about that time, the shots rang out." (Later) "And I jumped back up on the curb, and his head was blown off right in front of me." (Later, while pointing to a location on the west side of the white pergola on the north side of Elm Street. This location is to the northeast of the tree behind the picket fence, and approximately 40 feet northeast of the corner of the fence, where many theorists assume the assassin was located.) "It was right up there. The man was shooting from right, just this side of that tree, that large tree. And that's where I saw the shots come from." (Later) "The Warren Commission says that it happened from the school book depository, right up there in that corner window. But I don't know about that. I don't know anything about those shots up there. All I know is what I saw on the knoll. And I definitely saw the man shooting from the knoll." (**11-19-93** article in USA Today) "Adds Jean Hill, a 62-year-old Dallas schoolteacher who says she was the closest spectator to Kennedy when he suffered the fatal head shot: 'At the very instant that Kennedy's head exploded, I saw a rifle flash and a puff of smoke on the grassy knoll behind the picket fence.' She says she saw 'the outline' of the shooter, although no one reported spotting a second gunman at the time of the killing."

(Interview on Black Op Radio, **6-15-00**) (When asked where she thought the shots came from) "I saw a shooter behind the fence on the grassy knoll, and the debris and so forth, the blood and the brains, hit my boyfriend's helmet and he was riding (a pause, to which Len Osanic adds 'to the rear left,' to which she adds) "right." (When it was repeated that she thought the shots came from the front) "Yes, I saw the man." (When asked if she saw a puff of smoke) "a puff of smoke, a flash of light from the rifle. I caught a glimpse of someone up there." (When discussing the possibility she would have been hit) "We were within ten feet of the car." (When discussing the shots from the sniper's nest) "I feel like those shots were just to get attention and get people looking in the wrong direction. And I think they succeeded." (When asked what the shots sounded like) "It sounded like gunfire, yes...I knew immediately it was gunshots. I never thought it was firecrackers..." (When asked how many shots she heard) "4 to 6. I know that I heard 4 and as many as 6." (When asked what she was looking at) "I was actually watching Kennedy...I was following his head, and just as his head blew off is when I saw the flash of light from in front of him...So I knew it was a shot that came from the front." (When asked if she saw the limousine stop during the shooting) "I know it was hardly moving, if not stopped at one point." (When discussing the possibility limousine driver William Greer shot Kennedy) "I have no idea what happened in the car." (When asked if she was in the street or on the grass at the time of the head shot) "I was right at the curb. I had been out in the street but was back on the curb at the time of the shots." (When asked where the limo was in relation to her at the time of the shots) "Just before me but the head shot was right in line with me." (When asked if she noticed anything in the Z-film that was at

variance with her recollections) "I think it goes along with what I said." **Analysis:** Jean Hill's early statements described 2 quick shots, one as Mary Moorman took her picture and one after Jackie cried out, and then 2 or more shots after a pause. As virtually no one else claimed to hear shots after a pause after the head shot, it seems possible Ms. Hill was hearing the echoes of the two loud shots she'd just heard. The possibility of her having super-human hearing is refuted by the fact that she failed to hear even one shot before the head shot. By the late 80's, however, she tried to correct this problem by changing her story. She now described a first shot a moment before the head shot and the taking of Moorman's famous photograph. However, as the car at the moment of Kennedy's first being wounded was nowhere near being abreast of Hill, as claimed in her book, and as she could not possibly have "almost touched" the fender of a car some twenty yards in front of her, it's clear these later additions to her story are nonsense. Her sudden recollection that she saw a shooter on the knoll is even more curious. **Did not hear the first shot. Last two shots (or more) bunched together (with the last shot after the head shot).**

Charles Brehm and his small son Joe were several yards to Moorman's and Hill's right and can be seen in the Zapruder, Nix and Moorman films, as well as the Bond photo. (11-22-63 notes on an interview of Brehm by Dallas Times-Herald reporter Kent Biffle immediately after the shooting, as presented in The Zapruder Film by David Wrone, 2003) "The shots came from in front of or beside of the President." (11-22-63 article in the Dallas Times Herald) "'The first time he slumped and the second one really blasted him.' These were the words of Charles Drehm... 'After the first shot, the President's wife rose slightly to hold the President and they both went down in the second shot. He was definitely hit badly,' Mr. Drehm said. Mr. Drehm said the President was half-standing, waving to the crowd, when he heard the first of two shots. He said after the President was knocked down, apparently by the second shot, the President's car roared underneath the triple underpass." (Later in the article) "The witness Drehm was shaking uncontrollably as he further described the shooting. "The first shot must not have been too solid, because he just slumped. Then on the second shot he seemed to fall back." Drehm seemed to think the shots came from in front of or beside the President. He explained the President did not slump forward as he would have after being shot from the rear. The book depository building stands in the rear of the President's location at the time of the shooting...Drehm said he was within 10 feet of the President at the time of the shooting. 'It was definitely a rifle,' he said." (11-22-63 UPI article by Merriman Smith found in the Pittsburgh Press) "Charles Brehm, 38, was standing in the crowd at curbside about fifteen feet away as the President's car approached. 'He was waving and the first shot hit him, and then that awful look crossed his face,' Brehm said." (11-22-63 KRLD news report, around 2:00 PM CST) "A man named Charles Brehm was standing in the big crowd at curbside about fifteen feet away as the President's car approached. Brehm said 'He was waving and the first shot hit him, and that awful look crossed his face.'" (11-22-63 phoned-in interview first broadcast around 2:15 on WBAP TV. The film of this interview is broadcast a bit later, around 3:15 PM) "Unfortunately I was probably 15-20 feet away from the President when it happened... He was coming down the Street and my five-year old boy and myself were by ourselves on the grass there on Commerce Street. And I asked Joe to wave to him and Joe waved and I waved (breaks up)...as he was waving back, the shot rang out and he slumped down in his seat and his wife reached up toward him as he was slumping down and the second shot went off and it just knocked him down in the seat." (When the interviewer interjects "Two shots?") "Two shots." (When asked if he saw the shooter) "No, sir, I did not see the man who did it. All I did was look in the man's face when he was shot there and saw that expression on his face and he grabbed himself and slide, and the second one whenever it went--I'm positive that it hit him--I hope it didn't--but I'm positive it hit him and he went all the way down in the car. Then they speeded up and I didn't know what was going on so I just grabbed the boy and fell on him in hopes that there wasn't a maniac around." (11-22-63 (KLIF) radio interview found on the internet) "I happened to be about fifteen feet away from the President when the first shot hit him. There is some discussion now as to whether there

was one or two shots that hit him, but the first shot rang out and I was positive when I saw the look on his face and saw him grab his chest and saw the reaction of his wife that he had been shot and just at that time, which was probably a few seconds later the second shot rang out and he just absolutely went down into the seat of the car. There was a third shot that went and by that time I had grabbed my little five year old boy who was with me and ran away from the scene of the thing. But the only thing that I did witness and something I'm sorry I did witness very honestly was the look on his face when that shot hit, and the look again on him and his wife's face when the shots started to ring out. And it was very obviously that he was hit. The first two shots that were heard. The first one hit the president—there was no doubt whatsoever--because his face winced and he grabbed himself and he slumped down. I do believe without any doubt that the second one hit him because he had an immediate reaction with that second shot. I do know there was a third shot but as I said by that time I had grabbed my boy and started to go. I did not witness Governor Connally's being hit."

(11-24-63 interview with the FBI, 22H837-838) "He and his son stood right at the curb on the grass and saw the President's car take a wide swing as it turned left into Elm Street. When the President's automobile was very close to him and he could see the President's face very well, the President was seated, but was leaning forward when he stiffened perceptibly, at the same instant what appeared to be a rifle shot sounded. According to Brehm, the President seemed to stiffen and come to a pause when another shot sounded and the President appeared to be badly hit in the head. Brehm said when the President was hit by the second shot, he could notice the President's hair fly up and then roll over to his side, as Mrs. Kennedy was apparently pulling him in that direction. Brehm said that a third shot followed and that all three shots were relatively close together. Brehm stated that he was in military service and has had experience with bolt-action rifles and he expressed his opinion that the three shots were fired just about as quickly as an individual can maneuver a bolt-action rifle, take aim, and fire three shots. Brehm stated he definitely knew that the President had been shot and he recalled having seen blood on the President's face. He also stated that it seemed quite apparent to him that the shots came from one of two buildings back at the corner of Elm and Houston Streets. Immediately after the third shot rang out, Brehm pushed his son down on the grass and for the moment was more concerned with the safety of his son who might be hit by any wild gunfire which might follow. Brehm expressed the opinion that between the first and third shots, the president's car only traveled some 10 to 12 feet. It seemed to him that the automobile almost came to a halt after the first shot, but of this he is not certain. After the third shot, the car in which the president was riding increased its speed and went under the freeway underpass."

(12-1-63 article in the Philadelphia Bulletin) "As the President passed him about 20 feet away, Brehm said, he heard the first shot. It was 12:32 PM. 'He (the President) stiffened,' said Brehm. 'He had been sitting forward on the seat, not sitting deep back. He seemed to straighten out--as if digging his heels into the floor of the car.' The President's hand came up slowly to his neck, said Brehm. 'He gave a cringe of pain,' he said. This was not the bullet which caused the massive head wound, said Brehm. 'I saw what the next bullet to hit him did to his head,' he said. So this first bullet was the one which entered the President's body at the neckline, and, perhaps splintering, left a wound in his neck just below his Adam's apple near his necktie, and coursed down into his chest. Both Brehm and Truly, who was standing in front of the depository, thought that at this moment the limousine swerved--or 'jerked' as Brehm put it--to the left as if about to speed away. Then, however, Brehm said, it seemed to lose momentum--'almost as if the driver had taken his foot off the gas.' Maybe I was just imagining it,' said Brehm. 'Maybe I thought it was swerving because I just wanted that thing (the limousine) to leap out of there--get out fast.' And then, for a long few seconds, there seemed to be silence. There seemed to be no immediate awareness of what happened. Brehm said the President's smile was 'sagging.' He had a pain-stricken look on his face,' he said. The President was still sitting straight, said Brehm. It wasn't until the President was hit again that he slumped against his wife, and she took his head in her arms.

'He seemed to be conscious that something terrible had happened to him,' said Brehm. 'It didn't look like it knocked him out.' Two facts of hideous portent emerge from the stories told by Brehm and others. The President's head was still visible above the leather upholstered seat of the limousine to the eye on the other side of the telescopic sight. Also, the car was still moving at 15 to 18 miles an hour. The rifleman, however, shifted his aim to Texas Gov. John B. Connally. Brehm said he heard a second shot, but didn't know where it went. 'I was watching the President,' he said. This shot hit Connally in the back just under the right shoulder blade. It splintered the fifth rib, coursed down through the body, and emerged from his side to break his right wrist lying in his lap and lodge in his left thigh. Brehm said he knew by the sound of the shots that they had crossed his line of vision rather than coming from over his shoulder or from the other side of the road. And still--after the second shot--the President's head was still visible above the seat; still there was no sudden burst of speed. The effect of the third bullet was murderous. It hit the back of the President's head with an ax-like or chopping effect. Another fraction of an inch--and the bullet might just have creased the President's head. Still another fraction of an inch and it might have missed him altogether. As it was, it hit at a shallow angle, ripping off a piece of skull 'perhaps the diameter of a teacup,' said Dr. William Kemp Clark, a neurosurgeon."

(**3-28-66** interview with Mark Lane as shown in the Mark Lane movies *Rush to Judgment*, 1967, and *Two Men in Dallas*, 1976) "he was possibly 30 feet away when the first bullet struck, moved a little closer and was possibly 20 to 25 feet away when the second bullet hit... When the second bullet hit, there was (he motions to his right ear)—the hair seemed to go flying. It was very definite then that he was struck in the head with the second bullet and, uh, yes, I very definitely saw effects of the second bullet... I saw a piece fly over in the area of the curb where I was standing... it seemed to have come left and back... whatever it was that I saw did fall both in that direction and over into the curb there." (**3-28-66** interview with Mark Lane as quoted in *Rush To Judgment*, 1966) "I very definitely saw the effect of the second bullet that struck the President... That which appeared to be a portion of the President's skull went flying slightly to the rear of the President's car and directly to its left. It did fly over toward the curb and to the left and to the rear." (Note: Lane quotes Brehm as saying "the second bullet that struck the President" when Brehm merely says "the second bullet" in the filmed interview. While this may have been a simple error, or have reflected merely that Lane was trying to clarify Brehm's statements, Brehm was quite clear elsewhere that he felt the head shot was the second shot, and not the third. It seems possible then that Lane thought this damaged Brehm's credibility and was trying to hide this from his readers.) (Mark Lane's comments regarding Brehm at the Associated Press Managing Editors Convention in San Diego, California, **11-17-66**, as published in an AP story found in the 11-27-66 *Eugene Register-Guard*.) "On Nov. 22nd the press found Charles Brehm. He was standing right there. He was very likely the closest witness, closest spectator--to the assassination. He was on radio and television. He was interviewed by newspapers and his name appeared in almost every newspaper in America on Nov. 23. It's unfortunate that the Warren Commission never found Mr. Brehm and never questioned Mr. Brehm. It's unfortunate our distinguished colleagues, lawyers for the Commission, never questioned Mr. Brehm. Because Mr. Brehm said--and it is not, unfortunately, on record anywhere, except in a filmed interview which we conducted--Mr. Brehm said: 'I saw the effect of the bullet upon the President's head. As the bullet struck his head, a portion of the President's skull was driven backward and to the left over the rear and left of the car indicating that the fatal shot came from a right front area, not from the rear, not from behind the limousine.' The press found Mr. Brehm on that day. Unfortunately, the Commission never could, or never tried..." (The quote Lane provided for Brehm was, unfortunately, not accurate, and included Lane's interpretation of Brehm's words, and not the words themselves.) (**11-22-66** AP article found in the *Alton Illinois Evening Telegraph*. The substance of this article, which was undoubtedly written as a response to Lane's statements a few days before, was that Brehm trusts the Warren Report, and believes no shots came from in front of Kennedy.) "When the first shot went off I really didn't think it was gunfire. He (the president) had a

sense of humor, and when his hands went up to the sides of his neck I thought he was making a gesture. I thought it was a backfire. Then the second shot hit. He went down. He Just went down. I knew the sound that bullets make, and it was at this time that I thought it was shooting. It was too weird to think he was really shot. When I realized he had been I was trying to push that car to go, go, go. I fell with the boy on the ground. The third shot really upset me. I knew he was hit the first two times but the third one didn't make any sense at all." Brehm said the Presidential car almost stopped after the first shot, but speeded up and took evasive action after the second... Brehm said, "I contend that the third shot went wild."

(Late 1966 interview with Lawrence Schiller recounted in *The Scavengers and Critics of the Warren Report*, published **1967**) "When the first shot went off, I thought it was a backfire from from a motorcycle. But when his hands went up, then I realized 'My God, he has been shot.' On the first shot I was possibly thirty feet maximum from him. On the second shot he was not more than fifteen feet away. I couldn't imagine that it was a shot. But when I seen the president stiffen and his hands go up, I knew then that he had been shot. From where I was on the second shot, the damage was visible to the President's head. It was clearly visible that he had been hit in the head. I could see that the damage was severe. There was definitely blood. It was not a great flow of it but you could see the area crimson. I did not see blood on the first shot. Then I grabbed the boy and threw him on the ground and fell on top of him, a natural infantry instinct that came to me. There were only three shots. It was a third wasted shot that from the sound of it, and I'm taking into account that I've heard these things go past me before and I've stopped a couple of them, that third shot came nowhere near the parade. I felt that was the hurried shot." (When asked if he saw something fly from the president's head) "I did see something fly to the left of the car and down into the street. I saw something but I couldn't positively identify it and I don't want to go on record as identifying it....My belief, and if I had to die on the spot from my belief, is those two shots came from the same place. I couldn't pinpoint it, but they came from what was established as a window. There was no shots from anywhere else...the shots came from up at the School Book Depository. There was no doubt in my mind that this was the way that it was." (**1967** interview with CBS) (When disputing Mark Lane's claim he said the shots were fired from the picket fence on the grassy knoll) "No shot came from up there at any time during the whole fiasco that afternoon." (**3-30-68** interview with Barry Ernest as recounted in *The Girl On The Stairs*, 2011) "He said when the first shot was fired, the presidential limousine was slightly to his right, coming towards him on Elm. The car had slowed, nearly coming to a halt. Immediately after it passed where he and his son were standing, a second shot rang out, he said. This was the one that struck the president in the head and caused 'a piece of Kennedy's skull to fly back toward me.' At this point, Brehm was 'only 10 feet from the vehicle.' 'The car then sped up and the third shot missed completely.' The timing of the shots, according to Brehm, was the same as what others recalled: a pause of about three seconds between the first and second shot, and the third shot 'close to the second'... Brehm led me to the exact spot where he had been standing on November 22. He then directed my attention to the sixth floor of the depository, and to the close proximity of cars that continued to whiz by on Elm. He focused my attention to where the presidential car had been when he saw Kennedy's head explode. Much of his anger, he explained, was due to Mark Lane. 'He took my statements out of context and added a different meaning to them. Lane used my statement that a piece of the president's skull 'flew to the left' and that it 'came toward me' to imply that that shot had been fired from the knoll. I did not say that a shot came from there.'"

(**7-23-86** testimony in televised mock trial, *On Trial: Lee Harvey Oswald*) (When asked to tell the jury what happened, while standing in front of a map of Dealey Plaza) "As the car turned, and when I say the car I mean the Presidential car, turned and straightened out and started coming down (he is now pointing to the limo's location at approximately frame 175 of the Zapruder film) the first noise that I heard hit the President, uh. And it struck him and he raised his hand up to his neck (he now grabs the back of his neck with right hand). The car proceeded there it seemed very very slow, proceeded down

just beyond me in this area (he is now pointing to a location passed the steps seen in the Muchmore film, on the North side of Elm--this is approximately 50 feet passed the location of the limousine at the time of the head shot) when the second shot went off which absolutely destroyed the President's head. The car then took off in a zig-zag motion down into this area (he points to the stretch of Elm running parallel to the stockade fence) when the third shot--which seemed to me to be a wasted shot--went off, which frightened me more than any of the others because then I thought it was somebody shooting up the place. I then fell on my son." (When asked the time interval between the shots) "First and third shot. Somewhere around seven seconds." (When asked the location from which he thought the shots had been fired) "I told the officers that they came from one of the two buildings, one of which was the school book depository, the other was over on that corner (he points to the Dal-Tex Building). One of the two." (When asked if he felt confident about this) "Yes, I do". (When asked if he felt the shots came from behind the President) "Absolutely." (When shown the Zapruder film and asked if it looks like Kennedy was hit by a baseball bat from the front.) "I can't say." (When later asked if he questioned the authenticity of the Zapruder film) "No, I question your analysis of the film." (NOTE: the next two questions and answers were apparently not televised on the program in the U.S. but are included in Vincent Bugliosi's book, *Reclaiming History*.) (When asked if he thought the shots were spaced out far enough to have been fired by a bolt-action rifle) "Very easily." (When asked if all the shots came from the same location) "All three shots were from the same origin."

(1988 interview recounted in *No More Silence*, published 1998, p.60-69) "After the car passed the building coming toward us, I heard a noise, and I say noise. If I wanted to recreate what happened, there was no shot that I could say, "God, there was a shot!" or something like that. There was a surprising noise, and he reached with both hands up to the side of his throat and kind of stiffened out, and you could see as he approached us that he had been hit. Of course, it became obvious immediately after the surprise noise that it was a shot and that he was hurt. And when he got down in the area just past me, the second shot hit which damaged, considerably damaged, the top of his head. Realizing that he was hit in the head, and from what I could see of the damage, it just didn't seem like there was any chance in the world that he could have lived through it. That car took off in an evasive motion, back and forth, and was just beyond me when a third shot went off. The third shot really frightened me! It had a completely different sound to it because it had really passed me, as anybody knows who has been down under targets in the Army or been shot at like I had been many times. You know when a bullet passes over you, the cracking sound it makes, and that bullet had an absolute crack to it. I do believe that that shot was wild. It didn't hit anybody. I don't think it could have hit anybody. But it was a frightening thing to me because here was one shot that hit him, obviously; here was another that destroyed his head, and what was the reason for the third shot? That third shot frightened me more than the other two, and I grabbed the boy and threw him on the ground because I didn't know if we were going to have a "shoot'em-up" in this area. After I hit the ground and smothered the boy, it was all over. The people were running helter-skelter here and there. They were running up to the top of that hill it seemed to me in an almost sheep-like fashion following somebody running up those steps. There was a policeman who ran up those steps also. Apparently people thought he was chasing something, which he certainly wasn't. There were no shots from that area, but some of the people followed him anyway....At this time, I might say that I did not stand there, basically, and count shots. There were events that were accompanied by shots, and the events are lodged in my mind more so than the shots because of the President's motion when he was hit, with the shot in the head and the wild shot that was going away from the place; everything that stands out in my mind was a consequence of the shots. I never thought of them as "There was a shot! What did it do?" It was always, "What happened?" and it was because of the shot fired from up there." (Interview in the Discovery Program *The End of Camelot*, broadcast 1993) "As they made the turn at the school book depository, it had only come down a few feet, the first shot went off...And I realized it was no joke--that he was shot--and the strain on his

face. And the car kept coming down and just as it passed me--a few feet passed me, the second shot hit...By that time the caravan started to speed up, to get out of there, and that's when the third shot rang out." **Analysis:** aside from the 12-1-63 article in the Philadelphia paper, where it seems likely Brehm's words were sculpted to fit the writers' own theory that the second shot hit Connally, Brehm consistently claimed the President was hit by the first and second shots. While he failed to mention a third shot, which he felt came after the head shot, in his earliest interviews, by the evening of the shooting he was mentioning this detail as well. It seems possible, then, that in his earliest interviews he was focused on describing the shots he saw hit the President. The piece of skull Brehm saw crash into the curb is also intriguing in that it could be the item seen by Stavis Ellis and Royce Skelton. It is also interesting to note that Brehm's testimony to Bugliosi in 86 that all the shots sounded the same is in conflict with his statement to the AP in 1966. The use of Brehm in the Discovery Channel's 1993 program is also intriguing. There, after Brehm said "the second shot hit," the program cut to Governor John Connally clapping his hands and describing himself being hit. This was deceptive. Brehm had always claimed this second shot was the head shot to Kennedy. Apparently, the program's creators didn't realize this or just didn't give a damn. By having Connally claim the second shot hit him, after having Brehm claim the first shot hit Kennedy, the program was already at odds with the "official" story, so why even pretend Brehm's and Connally's stories were consistent? **First shot hit 190-224. Last shot after the head shot.**

Beverly Oliver (now Beverly Masegee) claims to be the woman standing behind Brehm and his son. People often refer to this woman as the Babushka Lady. Some of her statements unrelated to the shooting itself are presented so one can better judge her credibility. (3-21-77 memorandum from HSCA investigators Howard Gilbert and John Moriarty to HSCA assistant chief counsel Robert Tanenbaum, as found in the John Armstrong collection on the Baylor University website) "She knew Ruby...One day several weeks prior to the assassination she went over to the Carousel Club and went up to Ruby who was sitting at a table with Jada (a stripper), Andrew Armstrong (Ruby's bartender) and a man who Ruby introduced as 'Lee Oswald of the CIA.' Beverly had a drink with them and spent about twenty minutes at the table and got a good look at Oswald's face... On the day of the assassination, Beverly was wearing a scarf and taking motion pictures of the parade in Dealey Plaza. One or two days later she returned to the Colony Club and was met by two men who identified themselves as being with the FBI or CIA. She turned over the film to them and never saw them again. She took Gary Shaw and Penn Jones to Dealey Plaza and showed them where she took the photos from and Shaw confirms that her position is in accord with the Babushka lady. Beverly was unable to identify herself as the Babushka lady because of the lack of a good face photo, but she said she was similarly dressed and the photo could have been her. Beverly never came forth with the information set forth above and was discovered by accident by Gary Shaw while in a Baptist Church. He heard she had been in Dealey Plaza and while questioning her the information was elicited. Beverly impressed us as being very straight forward and will make a good witness. She has no apparent reason to fabricate and apparently feels very strongly about religion at this time... Andrew Armstrong, a Ruby flunky who thinks of Ruby as a hero will never corroborate Beverly. Jada, the stripper, was interviewed by the FBI and denied knowing LHO, but it may have been another stripper that was at the table. In any event we will follow up and try to make contact with Jada." (The Men Who Killed Kennedy, broadcast 1988) "When I first heard a noise I was not aware that that was a shot being fired. And maybe perhaps that's why I continued to film because I thought it was a backfire or a firecracker. I mean I wasn't used to being around guns. I did not realize that those were shots until I saw in the frame of my camera President Kennedy's head come off, the back of his head. Then I realized that that was a shot. I don't know how many I heard. I know where I thought the shots came from. It was the picket fence area, around that large tree, somewhere on the other side of those steps but in the picket fence area. There was a figure there and there was smoke there. I will always believe that the man who shot President Kennedy was standing somewhere in the

picket fence area and no one will convince me any differently.” (second interview) “I’m convinced and no one will ever convince me any differently that the shots came from behind the area of the picket fence on the grassy knoll. No one will ever convince me. I saw it. I believe it’s where it came from. And the only way that I’m gonna believe any different is when I stand before the judge on the judgment day and he tells me. But I know what I saw and that’s what I saw.” (Video-taped interview with Mark Oakes, **Spring, 1992**) "I'm not really certain when I heard the first shot. I know there were sounds prior to me realizing that there had been a shot fired that had killed the president. In my mind I had thought about it being those little things that they used to make when I was a child. You are probably too young to remember, but they used to make a little thing about the size of piece of round bubblegum, and you threw it on the sidewalk and it exploded. It made a pop. And that's, you know I thought, I remember thinking gosh it's really weird to let somebody bring those down here in this crowd, and that's all I thought--I mean, I can't remember thinking anything that it was a shot. The only time I realized a shot had been fired was when I was looking through the viewfinder of my camera at the time the President was fatally wounded. He went violently back against the seat and the back of his head blew off." (Interview with Robert Groden in his video, *The Case for Conspiracy*, **1993**) "Just as he gets past me, there's a sound that goes ba-boom, and he goes back against his seat and the whole back of his head comes off and it looks like somebody threw a bucket of blood out the back of the car" (When asked what part of Kennedy's head was damaged) I couldn't pinpoint an exact part but it looked like the whole back of his head, like in this area right here (grabs the crown of her head) just went (motions backward) flying out the back of the car." (When asked from where she thought the shots derived) (she points to the picket fence west of the knoll steps) "Just to the right of that green-trunked tree and about thirty feet from the corner, west of the corner of the fence." (**9-30-93** article in the *Charlotte Observer*) "Ruby, she says, introduced her to Oswald a scant two to three weeks before Kennedy's Nov. 22, 1963, assassination. 'Jack Ruby introduced me to him as a CIA agent, or as Lee Oswald of the CIA.' ...Later, she says, she joined the rest of the crowd at Dealey Plaza, hoping to get a glimpse of the president as his motorcade rolled through. 'I was a 17-year-old girl who just went to see the president,' she said. But Masseur says she became more than a face in the crowd. She also was the woman wearing a head scarf and holding a camera who can be seen in the famous Abraham Zapruder assassination film. Finding 'the babushka lady' became an obsession for investigators and researchers until 1977, she says, when government investigators identified her."

(**11-19-93** article in *USA Today*) "Beverly Oliver was a 17-year-old singer at the Colony Club, competitor of Jack Ruby's Carousel Club, when Kennedy was killed. She said she knew Ruby well, and that - contrary to Warren Commission findings - he knew Oswald. 'I was introduced to Oswald, about two or three weeks prior to the assassination, by Jack Ruby,' she says of the man who shot Oswald two days after Kennedy's death. 'He said, 'This is my friend, Lee Oswald. He's with the CIA.' (**11-23-93** article in the *Dallas Morning News*) "Ms. Oliver-Massegee gained fame when she became among the first to claim that shots were fired from behind the picket fence on the grassy knoll. Over the years, however, the veracity of her claims has come into question. Some, including Gerald Posner, author of the recent best-seller *Case Closed*, even say that Ms. Oliver-Massegee is not the same woman caught on film as the presidential motorcade passed. On Monday, Ms. Oliver-Massegee, 47, was only one voice in a chorus of Posner-bashing. "I'm going to sue Gerald Posner, and I'm going to sue CBS," she said." (From her book *Nightmare in Dallas*, published **October 1994**) "Beverly heard a pop, pop sound coming from the direction she faced....How rude that some parents would let their kids throw sidewalk poppers near the President, she thought. Then she heard another pop. Hold steady. The car was moving about twelve miles an hour as it passed directly in front of her. It then seemed to come to a stop. She continued filming wishing President Kennedy would turn around, then a loud, boom-boom sounded, and the President's head was violently thrown backward as a spray of crimson blood spouted from the back of his head..." "Oh, my God...he's been shot." She saw Jackie pull her husband down toward the

seat as if she were trying to protect him and then crawl out onto the trunk of the car to pick up something which seemed to come from the President's head... People were screaming and falling to the ground. A motorcycle policeman crash-parked his cycle and raced up the grassy slope from where Beverly heard the gunfire... Beverly smelled something acid in the air. It didn't smell right. A cloud of smoke drifted up from behind the fence and dissipated as it blew across the lawn." (11-18-94 testimony before the ARRB) "I am not a researcher. I was a 17-year-old girl that was at Dealey Plaza that day taking pictures of the President when he was assassinated. I never wanted to become a public figure over this. I never intended to. Until my name was accidentally leaked to the press in 1972, I was not a public figure. It has caused me great grief. It has caused me a lot of concern in my life. I have been called a liar as recently as today. I have been called a hoax. I am neither a liar nor am I a hoax. I am who I say I am. I was down there that day standing between 20 and 30 feet from the President when he was shot. I was taking a movie film which on the 25th of November was confiscated by a man who identified himself as an FBI agent." (When asked if she had any proof she gave him the film) "No, because I was only 17 years old and I wasn't smart enough to ask for a receipt. This is a man representing my government. If he had asked me for my soul, I would have tried to give it to him. Also, there are ulterior motives, and I would go ahead and tell you that before someone else does. Laying next to the camera in my makeup kit was a Prince Albert can of marijuana, and I would have done anything to keep him from looking in my makeup kit. But also let me share this with you, I no longer use marijuana or anything else. I am a born again Christian and I am married to a preacher and have been for 23 years." (Oral History interview performed for the Sixth Floor Museum, 1-12-07) "Shortly after he turned onto Elm Street, there was a noise. I didn't recognize it as gunfire. I thought that somebody had let there kids bring...those little poppers that you throw on the ground and they pop. And I remember distinctly thinking why would somebody let their kids bring those down here on a day like this. Anyway, bang bang...bang. And I'm still not realizing that anything is wrong because people are still cheering. And I'm still filming. And just as he gets passed me there was this big noise that went BA-BOOM. And it was like the whole back of his head just exploded, like a bucket of blood went over the back of the limousine." (11-11-09 interview broadcast on Nightfright radio) "I don't know if the first sounds I heard were shots. I could not get on the witness stand and swear that they were shots. Excuse the term. I thought that someone had allowed some little kids to bring what we called back then poppers. They were little bitty things about the size of your fingernail and you threw them against the sidewalk and they popped...The first sounds that I heard went bangbang...bang. But I could not say that they were shots...Just as he got past me to my left...as I turned to follow the motorcade, I heard a big KABOOM! And when that happened it looked like the whole back of his head just come out back over the trunk. At the time I thought it was brains but I now know it was skull..."

(3-19-12 phone interview with researcher Josh Cron, as reported on the Education Forum, 3-20-12) "I couldn't really say how long I was waiting for the President to arrive, but it wasn't very long. The whole plaza was just filled with static electricity. You could feel it in the air, and it made the hairs on the back of your neck just stand right up. There's just no way to properly explain it... I took my camera out and took footage of the nearby buildings and people to make sure it was working. You could tell the President was approaching from the roaring of the crowd as it got near. I began filming again just before the President's car turned, and as it made the turn from Houston onto Elm I heard "bang-bang.. bang" a little to the right of where I was standing. I don't know if they still have them, but I thought it was one of those little poppers that people throw and they explode. Like the size of a gumball. And I actually thought to myself, "Who in their right mind would throw one of those down here today?" Then as the limousine got a little past me I heard "ba-boom", just deafeningly loud. And I saw the whole back of the President's head just explode. It looked like someone threw a bucket of blood out the back of the car. And then I saw Jackie on the back of the car reaching out for what I thought at the time was a piece of the President's skull. Then the car disappeared beneath the overpass... I did see Roscoe

White on the grassy knoll. He was just to the right of the steps. I couldn't tell where he was coming from. I assumed he was just over there to talk to people. I certainly recognized him, and we made eye contact and I'm sure he recognized me as well. He was used to seeing me in different hair colors, so I'm sure he didn't have any trouble recognizing me... I couldn't say whether the second set of sounds I heard was one shot and an echo, or two shots fired almost simultaneously. The sound seemed to originate just to my left, but I couldn't say for certain where any of the shots came from... I heard what I thought were the poppers just after the president had made the turn onto Elm. The car behind him was still on Houston." (When asked if she noticed anything as the car turned onto Elm) "Everything seemed normal right up until I heard the "bang-bang.. bang." (When asked if she noticed where Mary Moorman was standing at the time of the shots) "She was right on the curb. Right next to Jean Hill. I didn't ever see her in the street." (When asked if she saw the limo stop) "They were going pretty slow as it was. I've been asked this before, and I really can't tell you if the car slowed down or stopped. I was just so shocked at everything I had just seen. I just couldn't say for sure." (When asked if the explosion of skull apparent in the Zapruder film is consistent with her recollections) "I certainly believe I saw the back of his head come off, and I believe the film does show what I saw – the back of his head exploding... I suppose there is a chance it wasn't the back of his head, but I do not believe so. How else would a piece of his skull end up on the trunk of the car?" (Cron then reported: "When I asked if there was anything in the film that lead her to believe it had been doctored, she responded with a no.")

Analysis: while Oliver shares a characteristic with William Newman and Toni Foster—all three heard early sounds they originally thought was a firecracker--the rest of her story is in line with Mary Moorman and Jean Hill, who heard no early shots at all. While she originally stated she didn't know how many shots she heard she later indicated there were five. The acid-scented smoke drifting over from the knoll is almost certainly poetic license, however. And the other parts of her story, such as Jack Ruby's introducing her to Lee Harvey Oswald, or her seeing Roscoe White on the knoll, smell to high heaven. Her lack of credibility, moreover, may have nothing to do with whether or not she is in fact the woman in the film (many doubt it's even her), but have more to do with the long delay in her telling her story, and her ongoing contact with conspiracy theorists, many of whom believe both that Oswald and Ruby knew each other, and that shots were fired from the knoll. **Heard five shots? Two early shots. Last two shots bunched together. Saw smoke on knoll.**

Meanwhile, on the north side of the street...

Cheryl McKinnon was a short ways to the left of the Newmans and can be seen collapsed on the ground near the Newmans in the Wiegman film and Bond photo. (From an **11-22-83** article in the San Diego Star News) "As we stood watching the motorcade turn onto Elm Street, I tried to grasp every detail... Suddenly three shots in rapid succession rang out. Myself and dozens of others standing nearby turned in horror toward the back of the Grassy Knoll where it seemed the sounds had originated. Puffs of white smoke still hung in the air in patches. But no one was visible. Turning back to the street, now suddenly frightened, I suddenly realized the President was no longer sitting up in the seat waving to the crowd. He was slumped over to his wife whose facial expression left no doubt as to what had occurred... the only thing I am absolutely sure of today is that at least two of the shots fired that day in Dealey Plaza came from behind where I stood on the knoll, not from the book depository."

Analysis: her description of the shots is a little too vague to come to any conclusions. Intriguingly, McKinnon, as Oliver, took many years before coming forward. One should wonder then if their recollections of smoke on the knoll are accurate or are something they picked up along the way. **Too vague. Saw smoke on the knoll.**

Charles Hester was standing on the knoll with his wife. In the Wiegman film, they can be seen crouching down up on the white arcade. (**11-22-63** statement to the Dallas Sheriff's Department, 19H478) "My wife Beatrice and I were sitting on the grass on the slope on Elm Street where the park is

located. When the President Kennedy's car got almost to the underpass, I heard two shots ring out...I grabbed my wife because I didn't know where the next shot was coming from and dragged her up next to the concrete embankment and got on the ground with her." (11-25-63 FBI report, 22H841) "Hester and his wife, Beatrice, were standing along the street at the point immediately preceding the underpass on Elm Street where President John F Kennedy was shot. Hester stated he saw the President slump in the seat of the car and that he heard two shots fired from what appeared to be a building located on the corner of Elm and Houston Street. He stated he and his wife were almost in a direct line of fire and that he immediately grabbed his wife and shoved her to the ground. He stated he thereafter immediately escorted his wife across to the North side of the street on an embankment in an attempt to gain shelter." **Analysis:** as Hester "immediately" threw his wife to the ground, he is almost certainly referring to the head shot and a succeeding shot. His grouping of the shots together in his first statement implies as much. The FBI is mistaken in reporting the Hesters were on the south side of the street and crossed over after the shots. The FBI's inclusion of Hester stating that the shots appeared to have come from a building on Elm and Houston (clearly a reference to the school book depository) is suspicious in light of Hester's earlier statement that he did not know where the next shot was coming from. **Did not hear the first shot. Only heard two shots. Last two shots bunched together.**

Mrs. Charles Hester (11-25-63 FBI report, 24H523) "Mrs. Hester advised she heard two loud noises which sounded like gunshots, and she saw President Kennedy slump in the car he was riding in. Her husband then grabbed her and shoved her to the ground. Shortly thereafter they then went across to the north side of the street on an embankment in an attempt to gain shelter." **Analysis:** a little too vague, but she is probably referring to the same two shots heard by her husband. **Did not hear the first shot. Only heard two shots. Last two shots probably bunched together.**

Chapter 7b: More Pieces in the Plaza

Between the Signs

There are many disappointing aspects of the aspects of the FBI's investigation into the murder of President John F. Kennedy. The FBI simply didn't try as hard as they should have. Once they had their man, Oswald, they simply stopped looking elsewhere. When one reads Volume 22 of the 26 volumes of supporting information for the Warren Report, one comes across dozens of statements taken by the FBI in March 1964. These were statements made by employees working in Texas School Book Depository Building. What is troubling about these statements is that they all seemed to be designed to answer three questions—where were you during the shooting, did you know Oswald, and did you see any strange individuals in the building on November 22nd, 1963? The FBI was clearly not interested in what happened, only if anyone else was involved. As a result, numerous witnesses to Kennedy's death were not even asked what they saw. Still, enough of them said enough to give us an idea. Still others undermined the FBI's efforts by saying that they'd never seen Oswald before or only vaguely remembered Oswald, and had not seen any strangers in the building. These were, in fact, mutually exclusive statements. By saying they had never seen Oswald, or only vaguely remembered seeing Oswald, who'd only worked in the same building with them for six weeks, they were as much as acknowledging they wouldn't know what a stranger looked like. A number of these employees watched the motorcade from the north side of Elm between the Thornton Freeway and Stemmons Freeway signs. Here then are the witnesses between the signs, in order from west to east. My placement of these witnesses is based on the research of Don Roberdeau.

Louie Steven Witt stood just in front of the Stemmons Freeway sign. He stupidly opened up an umbrella in silent protest as Kennedy passed, and has come to be known as "The Umbrella Man." While some still doubt Witt was the "Umbrella Man," and suspect his admitting as much was a

government plot, many of those doubting his identity fail to understand that his identity was only discovered when, some months after the HSCA had called for the person holding the umbrella to come forward, a co-worker to whom Witt had confided revealed his identity to members of the conspiracy research community. (8-12-78 Dallas Morning News article by Earl Golz in which Witt's identity was revealed) "Witt, interviewed by The News at his job in the warehouse of a filing equipment company near the Stemmons Freeway, neither would confirm nor deny he was the Umbrella Man. He said he could not remember exactly where he was in downtown Dallas when the President was shot but thought he probably would have been on his lunch hour." (Handwritten notes by HSCA investigator Jack Moriarty on an 8-12-78 interview with Witt, found on the Baylor University website, in the John Armstrong collection) "I had just about decided to leave and go back to work. Then it arrived and kinda took me by surprised. I first saw it rounding that turn at the top of the hill (Elm St.). I got up--been sitting on the grass all this time. I (picked?) up my umbrella--walking forward toward the curb. I did get it open--I think it blocked my view--and heard this string of firecrackers go off. I (thought?) 'What a damn foolish thing for someone to be playing (games?) at a time like this.' As I moved to the edge of the little retaining wall, the vehicles had passed to my right now. The effect began to get to me; The President's car stopped--a motorcycle man swirled toward me--The second car nearly hit the first and a man ran up and jumped on the President's car. I don't think I saw everything--that damn umbrella got in my way. The next thing I recall was a bright pink movement in the car--JFK's car--I think it was Jackie's pink dress...My military training included 'Hit the dirt!' when you hear shots. It didn't occur to me that these were shots.' (Later, apparently in reference to the shots) 'I had no sense of direction--source--or number. All in one location--I think.'" (9-25-78 testimony before the HSCA, vol. 4 p.329-352) "As I moved to the street, still walking on the grass, I heard the shots that I eventually learned were shots. At the time it didn't register as shots because they were so close together, and it was like hearing a string of firecrackers...As I was moving forward I apparently had this umbrella in front of me for some few steps. Whereas other people I understand saw the President shot and his movements, I did not see this because of this thing in front of me. The next thing I saw after I saw the car coming down the street, down the hill to my left, the car was just about at a position like this [indicating] at this angle here. At this time there was the car stopping, the screeching of tires, the jamming on of brakes, motorcycle patrolman right there beside one of the cars. One car ran up on the President's car and a man jumped off and jumped on the back. These were the scenes that unfolded as I reached the point to where I was seeing things." (Later, when asked if he could tell from where the shots were being fired) "No, sir, really couldn't. Of course, there were a number of shots and they all seemed to be just rapid--just very close spaced. As to the direction, I couldn't say." (When asked how many shots he heard) "I really couldn't say. Just remembering--I would have to say three or more." (When asked if they were in rapid succession) "Very. As I recall, very rapid." (When asked to demonstrate the speed on the table) "I don't know if I could really give you a good example, but it was just [witness wraps three times rapidly on table]." **Analysis:** while Witt suggests he was walking forward when the shots rang out, this would imply that all the shots rang out before frame 202, when Witt can be seen standing with his umbrella in the Willis photo. Since he appears to have lifted his umbrella by frame 225 or so, when the Bronson photos shows it to have been higher above his head, however, we can probably assume he was still adjusting his umbrella at this time, and was not yet fully aware what was going on. His statements on the rapidity of the shots are much more helpful, as they are completely at odds with the LPM scenario, in which a five second pause precedes the last shot. **Last two shots bunched together.**

John Chism (11-22-63 statement to Dallas Sheriff's Department, 19H471) "we were directly in front of the Stemmons Freeway sign...When I saw the motorcade round the corner, the President was standing and waving to the crowd. And just as he got just about in front of me, he turned and waved to the crowd on this side of the street, the right side; at this point I heard what sounded like one shot, and I saw him "The President," sit back in his seat and lean his head to his left side. At this point, I saw Mrs.

Kennedy stand up and pull his head over her lap, and then lay down over him as if to shield him. And the two men in the front seat, I don't know who they were, looked back, and just about the time they looked back, the second shot was fired. At this point, I looked behind me, to see whether it was a fireworks display or something. And then I saw a lot of people running for cover, behind the embankment there back up on the grass." (12-18-63 FBI report, 24H525) "According to Chism, he was standing on the curb in front of the concrete memorial on Elm Street...when the Presidential motorcade passed this point. As it passed in front of him he heard at least two shots and possibly three but no more. The first shot he thought was a firecracker until the second shot sounded and at the same instant he saw the President slump over in the seat of the limousine. On hearing the second shot he definitely knew the first was not a fire cracker and was of the opinion the shots came from behind him."

Analysis: as Kennedy was waving at the time of the first shot, and then leaned to his left, Chism failed to hear a shot at frame 160. As he failed to hear another shot until after Greer and Kellerman looked back, the next shot he heard was almost certainly the head shot, when the President "slumped." As he thought he might have heard three shots, he may have heard a shot after the head shot. Only heard two clear shots. **First shot hit 190-224.**

Marvin Faye Chism was John Chism's wife and stood beside him in front of the Stemmons Freeway sign. (11-22-63 statement to the Dallas Sheriff's Department, 19H472) "As the President was coming through, I heard this first shot, and the President fell to his left. The President's wife immediately stood over him, and she pulled him up, and lay him down in the seat, and she stood up over him in the car. The President was standing and waving and smiling at the people when the shot happened. And then there was the second shot that I heard...It came from what I thought was behind us and I looked but I couldn't see anything. The two men in the front of the car stood up, and then when the second shot was fired, they all fell down and the car took off just like that." **Analysis:** while Mr. Chism noted that Kennedy leaned his head to the left after the first shot—a reference to his actions after frame 190 of the Zapruder film-- Mrs. Chism said he *fell* to his left. Still, her recollection of Jackie "standing over" Kennedy can only be a reference to the frames leading up to the head shot. Her statement that the men on the front of the car fell down was merely her way of expressing that Greer and Kellerman ducked down after the head shot. **Only heard two shots. First shot hit 190-224.**

Gloria Jean Holt (3-18-64 statement to the FBI, 22H652) "I left the Depository building and walked down toward the Stemmons expressway underpass west of the building approximately fifty yards and took up a position on the curb on the south side of Elm Street to await the presidential procession...I was still standing on the curb at the time the president was shot." **Analysis:** Holt is one of a number of witnesses who described the north side of Elm Street as the south side. It's possible they thought that by crossing the dead end of Elm Street in front of the building to get to where they stood, that they had crossed onto the south side of the street. **Too vague.**

Sharon Simmons (Sharon Nelson) (3-18-64 statement to the FBI, 22H665) "I was with Jeanie Holt... at the time the President was shot." **Analysis: too vague.**

Stella Jacob (3-18-64 statement to the FBI, 22H655) "I left the Depository building and walked down toward the Stemmons expressway underpass west of the building approximately fifty yards and took up a position on the curb on the south side of Elm Street to await the presidential procession... (names Sharon Simmons and Gloria Jean Holt as companions) I was still standing on the curb at the time President John F. Kennedy was shot...." **Analysis: too vague.**

Carol Reed (3-19-64 statement to the FBI, 22H668) "At the time President Kennedy was shot I was standing on the curb of Elm Street about mid-way between the Texas school book Depository Building and the Elm Street railroad overpass. I was with Mrs. Karen Hicks...Miss Karen Westbrook...and Mrs. Gloria Calvery...at the time the President was shot." **Analysis: too vague.**

Karen Hicks (3-20-64 statement to the FBI, 22H650) “we walked to Elm Street and stopped at a point on the north side of Elm Street about halfway between Houston Street and the Triple Underpass. We were standing at this point when President John F. Kennedy was shot. The car he was in was almost directly in front of where I was standing when I heard the first explosion” (She names Calvery, Reed, and Westbrook as companions). **Analysis:** as Hicks was far down the street from Kennedy’s position at Z-160, she did not hear a first shot that missed. Number of shots??? **First shot 190-224.**

Karen Westbrook (11-23-63 UPI article found in the Fresno Bee) “I saw the president's hair fly up...I knew he was hit,' Karen Westbrook, 19 year old stenographer, sobbed.” (3-19-64 statement to the FBI, 22H679) “On November 22, 1963, I left my office...I was with (Calvery, Reed, and Hicks)...about halfway between Houston Street and the Triple Underpass. We were standing at this point when President John F. Kennedy was shot. The car he was in was almost directly in front of where I was standing when I heard the first explosion. I did not immediately recognize this sound as a gun shot.” **Analysis:** as Westbrook was far down the street from Kennedy’s position at Z-160, she did not hear a first shot that missed. **Number of shots??? First shot 190-224.**

Gloria Calvery (3-19-64 statement to the FBI, 22H638) “we walked to Elm Street and stopped at a point on the north side of Elm Street about halfway between Houston Street and the Triple Underpass. We were standing at this point when President John F. Kennedy was shot. The car he was in was almost directly in front of where I was standing when I heard the first shot.” **Analysis:** as Calvery was far down the street from Kennedy’s position at Z-160, the first shot she heard was not at Z-160. **Number of shots??? First shot 190-224.**

June Dishong (Letter written on 11-22-63, as read by her daughter on CNN, 11-21-2003, and featured on the Sixth Floor Museum website) “here come the president and his wife...His arm in the air waving...He drops his arm as they go by, possibly 20 feet. Suddenly--a sound. Gun shots? So hard to tell above the clamor of the crowd. The president bent forward into his wife’s lap as his arm slipped off the side of the car. Jackie circled him with her arm. Another shot. Panic among the people. Woman with children. Parents pushing them to the ground. No one knows where the shots are coming from. A cry. The President has been shot. A third shot, people scatter. I can't believe what I have seen. The picture of the man falling forward.” **Analysis:** this letter, which was only discovered after Dishong’s death, sums up what would seem to be the majority view quite nicely: a first shot hit at 190 (when Kennedy stopped waving, and Jackie moved closer to him), followed by the head shot (when people started screaming and dropping to the ground), followed by a third shot. **First shot hit 190. Last shot after the head shot.**

Jean Newman (11-22-63 statement to the Dallas Sheriff’s Department, 19H489, 24H218) “I was standing right on the side of the Stemmons Freeway sign, about halfway between the sign and the edge of the building on the corner... The motorcade had just passed me when I heard something that I thought was a firecracker at first, and the President had just passed me, because after he had just passed, there was a loud report, it just scared me, and I noticed that the President jumped, he sort of ducked his head down, and I thought at the time that it probably scared him too, just like it did me, because he flinched like he jumped. I saw him put his elbows like this, with his hands on his chest...the motorcade never did stop, and the President fell to his left, and his wife jumped up on her knees...I just heard two shots” (11-28-63 FBI report, 22H843) “She then walked in front of the building and turned right on Elm Street and stood on the curb on the North. A car carrying the President and other persons had just passed her when she heard a report and saw the President jump, raising his hands to his chest area. She stated she assumed the report to be a firecracker and thought how “human” the president was that he too would react by jumping at a sudden noise. She stated the car had proceeded to approximately 12 feet to her right when she heard a second report and saw the President slump to the front of the car...Mrs. Newman said she only heard the two shots but cannot definitely state that

additional shot or shots were not fired as people around her realizing what had happened began milling around and screaming.” **Analysis:** Mrs. Newman’s contention that screams may have prevented her from hearing additional shots indicates that she believed no shots were fired before the first one she heard. **Only heard two shots. First shot hit 190-224.**

Ernest Brandt claims to have been standing along the north side of Elm at the time of the assassination. He is readily observed in the Zapruder film. For many years, on the anniversary of the assassination, he returned to his place on the street wearing the same hat, and spoke freely to tourists, researchers, and newsmen. (12-07-93 article in the St. Petersburg Times) "Ernie Brandt, 67, wore the same small, brown hat he had worn that day. He heard two shots." (Oral History interview performed for the Sixth Floor Museum, 5-12-94) "Nothing had happened by the time the limo was exactly opposite us, from the curb straight out to the street. Nothing had happened, But I was still watching Kennedy from the back... I think the limousine was probably about 60 or 70 feet past us, three or four seconds I guess from the time. He wasn't moving real slow but yet not real fast either, y'know. And--60 or 70 feet past us, then BAM! the first shot was fired and boy it just reverberated around Dealey Plaza something terrible. It sounded like an elephant rifle to me." (11-22-95 article in the Dallas Morning News) "Ernest Brandt, a salesman, watched from the curb as President John F Kennedy's motorcade turned down the Elm Street slope toward Stemmons Freeway... "Kennedy's limo was about 15 to 20 feet past us when the first shot was fired. I was still looking at him and I saw his arms come up. My first thought at that instant was that it was a motorcycle backfire. But in a couple or three seconds there was a second shot and instantaneously everybody realized it wasn't a motorcycle backfire, including me and my customer... There was a big tree up the hill and I ran for that tree. My customer stayed right on the curb, and he saw the last shot hit Kennedy, but I didn't see it. I was running for that tree..." (11-23-98 article in the Ft. Worth Star-Telegram) "Dallas resident Ernest Brandt, 72, was wearing a hat yesterday, the same hat he wore on the day he stood under a tree and saw Kennedy shot, he said. Although many conspiracy theorists asked Brandt questions, he said that he only heard three shots and that all of them came from Oswald." (6-08-09 post by Don Roberdeau on the alt.assassination.JFK Forum) "ERNEST CARL BRANDT is one of the 41 DP witnesses that I have communicated with. The following is an exact transcript of the **July 2000** hand-written, 3-page letter that I received from BRANDT after I contacted him (all EMPHASIS and quotation marks were as BRANDT originally wrote them).... "President Kennedy was about 15 feet from me when the **FIRST SHOT WAS FIRED!!!** He was **SLIGHTLY PAST ME** at a **"ONE O'CLOCK POSITION"** in relation to my location on the **NORTH SIDE** of the Elm street curb. My observation of JFK's re-action to the **FIRST SHOT** (I WAS STILL LOOKING AT HIM) was that he **INSTANTLY RAISED HIS ARMS** (ACTUALLY I COULD ONLY SEE HIS RIGHT ARM)-(HIS BODY + HEAD OBSCURED MY VIEW OF HIS LEFT ARM) - TO A POSITION PARALLEL WITH THE GROUND, BUT BENT AT THE ELBOW. MY CLOSE SCRUTINY of the "Z" film tells me that JFK is apparently **UNHIT** prior to passing behind the highway sign, but, of course, his arms are moving **UPWARD** as he emerges from behind the sign. I **SEEM TO RECALL** JFK WAS **CASUALLY WAVING** to the very sparse crowd in Dealey Plaza as he approached my location. My feeling is that he was hit in the neck at about frame #208 to #210 in the "Z" film + that is only a **FRACTION** of a second **AFTER HE DISAPPEARED BEHIND** the sign - or possibly at the **VERY INSTANT** of moving behind the **"LEADING EDGE"** of the **SIGN!!!** Gerald Posner thinks (his book, "Case Closed") that the **FIRST SHOT** hit a tree limb and missed JFK, but, I disagree **EMPHATICALLY**. I am **TOTALLY CONVINCED** the **FIRST SHOT HIT** JFK in the back of the lower neck!!! Hence his reason for raising his hands up to his face - **HE WAS HIT** in the **NECK** + his **IMMEDIATE RESPONSE** WAS TO GO TO THAT GENERAL AREA WITH HIS HANDS!!! The **FIRST SHOT** WAS, I THOUGHT, A **POLICE MOTORCYCLE BACKFIRE** - (MY CUSTOMER** WITH ME THOUGHT THE SAME) AND AS JFK RAISED HIS ARMS I THOUGHT HE HAD **ALSO HEARD** the **BACKFIRE** + WAS **PLAYFULLY RE-ACTING** to it!!! **STRANGE THOUGHTS**

BUT, AN ASSASSINATION of the PRESIDENT of the U.S. WAS CERTAINLY THE LEAST LIKELY THING IN THE WORLD TO OCCUR!!! WHEN the 2nd shot occurred, it was the time I realized that SHOTS were being fired!!! and FEAR GRABBED ME QUICKLY!!! MY HEART BEGAN TO "POND" [sp] !!! I KNEW SHOTS WERE BEING FIRED BUT HAD NO IDEA AT ALL FROM WHERE!!! (MY CUSTOMER** DIDN'T KNOW EITHER) So I LOOKED BEHIND ME FOR A PLACE TO RUN - ABOUT A DOZEN FEET DIRECTLY BEHIND ME WAS A "LONE" TREE - + I RAN QUICKLY TO THAT TREE!!! ONCE THERE I FELT A LITTLE MEASURE OF SECURITY!!! I REALLY CANNOT TELL YOU THE DISTANCE BETWEEN ME + JFK WHEN THE 2ND SHOT WAS FIRED FOR THE ABOVE REASON. WHEN AT THE TREE I IMMEDIATELY GLANCED DOWN ELM STREET TOWARD THE TRIPLE UNDERPASS! THE JFK "LIMO" WAS CLOSE TO THE UNDERPASS + IT WAS OVER - THE SHOOTING HAD STOPPED - (THE THIRD SHOT WAS FIRED AS I RAN FOR THE TREE) - THE "LIMO'S" TAIL LITES WERE "ON" WHICH TOLD ME THE DRIVER (GREER) HAD HIS FOOT ON THE BRAKES + THEN BLACK SMOKE SPEWED FROM THE EXHAUST PIPE + THE "LIMO" SPED OFF IN A SUDDEN BURST OF SPEED + IT WAS ALL OVER!!!"

(From a 10-31-01 alt.assassination.JFK post by Dave Reitzes which included a **7-15-01** e-mail response from Brandt) (when asked if he heard two or three shots) "I did indeed think I heard only TWO shots at the time of the assassination...I KNOW, REPEAT, KNOW, THAT I HEARD THE FIRST SHOT. IT WAS EXTREMELY LOUD...When the second shot occurred I realized that the FIRST "noise" I had heard was NOT a police motorcycle back-fire...I quickly glanced behind me and saw a rather large tree... While consumed with FEAR & concentrating FULLY on arriving safely at that tree, the THIRD SHOT, OBVIOUSLY, was fired. I feel sure now that my ear-drums HEARD THAT THIRD SHOT." (**11-20-01** article in the Dallas Morning News) "Ernest Carl Brandt sent me a businesslike letter last week, offering his expertise on the shooting of President... He recalls standing at the curb, barely 15 feet from the presidential limousine, when the first shot was fired." (**2-10-02** article in the Ft. Worth Star-Telegram) "Ernest C. Brandt, who stood a few feet from the president's motorcade that day, says he believes he heard three shots. The first, which struck Kennedy's neck, sounded like a motorcycle backfiring, but the second, although a stray, was so loud, he knew it had to be from a rifle. 'Pandemonium broke loose,' Brandt recalled. 'My heart started pounding. I saw a big tree behind me. When I was running for it, the third shot was fired. I didn't see that shot; I was scared and running for that tree. But a customer of mine stayed on the curb, and he saw Kennedy's head explode.'" (**4-12-02** article in the Dallas Morning News) "Mr. Brandt, 75, was 15 feet from the president's motorcade when the first shot was fired. He didn't immediately realize what was happening, even as he watched it... 'In about three seconds there was a second shot. Then I realized it was not a backfire.' Mr. Brandt said he ran for cover behind a nearby tree, but the man standing with him was too frightened to move. He said the man witnessed a third shot as it hit Kennedy's head, but by the time Mr. Brandt reached the tree and glanced back, the car was approaching the triple underpass." (From a **2-06-03** article in Park Cities People) "'I stood only about 15 feet from President Kennedy when the first shot was fired,' Brandt said. He heard three shots at the time. 'I thought it was a motorcycle backfire at first,' he said." (From a **2-7-03** article printed in The Shorthorn Online, a college publication) "As he got closer, the crowd began to stir, and the ladies began to squeal. Then we heard the first shot—he was not 15 feet from me." (From an **11-22-03** WBAP radio program posted on Youtube) "Just as he got a little passed us (slaps hands together) BANG, a loud report. My first thought was it was a motorcycle backfire. My second thought immediately was that Kennedy heard that motorcycle backfire and he was just playfully reacting to it, see. Boy, and then in about three seconds or so there was a second loud report (slaps hands together) like that. And then I realized it was not a motorcycle backfire and somebody was shooting from somewhere and I got scared and looked for a tree." (From a **6-03-09** online article by Megan Blank for North Penn Life) "Ernest Brandt was only 15 feet from President John F. Kennedy when the first shot

was fired at 12:30 p.m. on Nov. 22, 1963. Previously, as that first motorcycle rounded the corner in Dealey Plaza in Dallas, a woman in a blue dress standing next to him commented on how all the police were probably along the parade route, adding, "It sure would be a great day to rob a bank in the suburbs, eh?" Then the shot, as loud as a Howitzer," Brandt said..."The crowd was happy, yelling, some of the ladies were yelling, 'Hi, Jackie,'" he said. "When Kennedy was directly in front of me, there were no shots, all was fine. Then, "I thought it was a motorcycle backfire," he said. "I saw him throw his arms up. I thought Kennedy was playfully reacting. Then two or three seconds later, another [shot]. Then I knew it wasn't." Brandt added that the press called that bullet the "pristine," or magic, bullet, which he thought was ridiculous. "I have a picture of it at my house," he said. "It's got the usual markings of a bullet shot through a gun." Another of the three shots missed, but "the third shot literally blew his brains out, and I mean literally," Brandt said...Terrified the shooter was facing him, Brandt ran behind a nearby tree. When he ran back, his customer was still standing there, out of shock." **Analysis:** it's interesting how Brandt told the Sixth Floor Museum he was 60-70 feet from Kennedy at the time of the first shot, but then began telling the press he was but 15 feet from Kennedy. While Brandt, a committed single-assassin theorist, has taught classes on the assassination, moreover, he needs to go back to school and re-evaluate his position. If the first shot was fired and hit Kennedy around Z-207, then who shot Connally at Z-224? His discussion of the head shot is also intriguing. He believes the third shot was fired after he started running, but the photographic evidence proves no one started running or ducking until after the head shot. This suggests that Brandt started running upon hearing the muzzle blast of the head shot, without even realizing it had struck anyone. **Only heard two shots. First shot hit 190-224. Second shot head shot. Last shot (which he did not hear) is by implication after the head shot.**

John Templin was the man standing to Brandt's left. (12-07-93 article in the St. Petersburg Times) "John Templin, 55, had voted for the first time, for Kennedy. He heard three shots invade the plaza..."You can't believe what goes through your head after seeing something like that," Templin said." (From Don Roberdeau's 6-08-09 post on the alt.assassination.JFK Forum, in which he recounts Templin's 6-28-95 Oral History interview with the Sixth Floor Museum) "TEMPLIN remembered hearing 3 audible muzzle blasts and/or mechanically suppress fired bullet bow shockwaves with the first two bunched distinctly closer together than last two he remembered... TEMPLIN said the first blast/shockwave originated from his left, "his" 2nd remembered blast/shockwave came from his right towards the railroad yard and hit JFK in head and it sounded different, and TEMPLIN's 3rd remembered blast/shockwave came from his left, with the total shots sequence lasting about 6 seconds...TEMPLIN thought "his" 1st remembered blast/shockwave was a motorcycle backfire... TEMPLIN saw limo brake lights illuminated during the shots...afterwards TEMPLIN - like BRANDT - did not go public with his claims until the early 1990's...afterwards TEMPLIN provided a 6-28-95 "Sixth Floor Museum" oral-histories interview and detailed that "his" 1st blast/shockwave occurred when limo was 30' PAST himself ---- again, negating the posner/myers shots scenario theory, adding further support for the many witnesses who timestamped a "1st remembered shot = 1st JFK impact" AFTER the President had already started his Z-170 starting right hand wave (and large tree hid JFK from *anyone* in the warrenatti, supposed, "lone nut" "sniper lair" from seeing-targeting him from Z-162 to 208)" (11-23-98 article in the Ft. Worth Star-Telegram) "Fairview resident John Templin, 60, who was with Brandt the day Kennedy was shot, said that remembering had been so painful he hadn't returned to the scene in almost 30 years. 'After it happened, I had a hard time sleeping for about two or three weeks,' he said." (11-22-00 article by David Flick in the Dallas Morning News) "John Templin...was on Dealey Plaza 37 years ago..."The first shot, I thought it was a motorcycle backfiring,' he said. 'I thought Kennedy was just playing, throwing his hands up in the air pretending to protect himself. But the second one came, and I knew it was the real thing." (from Brandt's 7-15-01 e-mail to Dave Reitzes, posted online) "So when John (Templin) my customer & I joined again at the curb only a

few seconds after the THIRD shot, I told him I only heard TWO shots...but he had heard THREE SHOTS...I then came to the realization that I really did HEAR the THIRD shot.” **Analysis:** Although Templin apparently believes the first two shots were closer together than the second and third, this is at odds with his recollection that second shot hit Kennedy in the head. One can only assume then that he has misremembered which pair was closer together. His appraisal of the last shot also needs some clarification. While Roberdeau reports that Templin said the last shot was fired after the head shot, and the 11-22-00 article by Flick seems to support this, Brandt insists Templin saw the impact of the final shot on Kennedy's head. Both of them can't be right. **First Shot Hit 190-224. Last shot after the head shot?**

Georgia Ruth Hendrix (3-24-64 statement to the FBI, 22H649) repeats “At approximately 12:15 PM on November 22, 1963, I left the Depository Building and took up a position along the parade route along Elm Street about 150 feet west from the Depository Building entrance and viewed the presidential motorcade... I recall that just a few seconds after the car in which President John F. Kennedy was riding passed the position where I was standing, I heard a shot. At first I thought it was salute to the President, but when the second shot was fired and I saw the President fall down in the car I knew someone was shooting at him. When I heard the third shot I turned and fled back into the Depository Building.” (No More Silence p. 73-78, published 1998) “When that first shot rang out, I thought it was a firecracker...But as I looked, he fell over, and about that time Mrs. Kennedy raised up and pulled the man up over the back of the car...With that, they were out of my view and in an instant they were gone!...In the meantime, there had been two other shots...we didn't know at first that they were targeting him anymore than they were just shooting at random. In all, I heard three shots, and it seemed to me that there was more time between the first and second and less between the second and third shots.” **Analysis:** while Ms. Hendrix first had one shot after the head shot and later had two shots after the head shot, she is consistent in that she heard a shot after the head shot. Since she says the first shot rang out as the limousine was just past her position, and she was west of Kennedy's position at Z-160, and as Kennedy was hit at least once before the head shot, she confirms that the first shot hit. **First shot hit 190-224. Last shot after the head shot.**

Billie Clay (3-23-64 statement to the FBI, 22H641) “At approximately 12:15 PM on November 22, 1963, I left the Depository Building and took up a position along the parade route along Elm Street about 150 feet west from the Depository Building entrance and viewed the presidential motorcade... (names Mary Williams, Georgia Ruth Hendrix, Sue Dickerson, and Mrs. John Hawkins as accompanying her) “Just a few seconds after the car in which President John F. Kennedy was riding passed the position I was standing I heard a shot. At first I thought it might be a firecracker or a motorcycle backfire, but when I heard the second and third shots I knew someone was shooting at the President...At this point the car president Kennedy was in slowed and I, along with others, moved toward the President's car. As we neared the car it sped off.” **Analysis:** as she states she heard three shots and that the first rang out as the limousine passed her, she is indicating that there was no first shot miss at frame 160. **First shot 190-224.**

Peggy Burney (11-23-63 first person account published in the Dallas Times-Herald) "I saw the President die. I was standing at the curb on Elm about a third the way from Houston Street near the overpass. When the President's car made the curve around the corner, he was smiling and waving. He was not standing, as I heard some reports say later. He was sitting, but he was happy and Jackie was happy and smiling as they passed. The car had passed about 15 feet beyond me when I heard the first shot. I did not realize it was a shot; I thought it was a backfire. The President ducked; instinctively I told myself 'something is happening,' but nobody knew what. Then I heard a second shot. I noticed that Jackie didn't duck - I could no longer see the President. The car momentarily stopped, then veered slightly to the right and speeded off. People around me were screaming; some were falling to the

ground. I could not tell whether they were hit, or not - or just dodging. There was pandemonium. Everybody realized that the shots were coming from up high. People were running around cars and jumping over things. Soon, all the buildings around here were locked - including ours. Squad cars converged. There must have been a hundred of them right away. My employer, Mr. (Abe) Zapruder was making a movie at the time it happened. He is still with the Secret Service men. As soon as we were inside the building before any reports on the condition of the President, Mr. Zapruder had already told us 'The President of the United States is dead.' 'We saw him die...' (11-23-63 UPI article found in the Fresno Bee) "'We all saw him die,' Mrs. Peggy Burney said. But neither she nor the others who witnessed the assassination of the President could believe what they saw. They thought the first of the three shots from the assassin's rifle was the backfire of a car." **Analysis:** Mrs. Burney's placement of the car at the time of the first shot--and assertion that Kennedy ducked in response to this shot--suggests a shot fired after frame 160. **Only heard two shots. First shot hit 190-224.**

Peggy Hawkins (3-26-64 FBI report, CD897 p.35-36) "Mrs. Hawkins said that the car containing the Presidential party had just passed in front of the building shortly after noon when she heard two or three shots fired in the near vicinity. She said she immediately recognized them as firearm shots and not as fireworks and had the impression that they came from the direction of the railroad yards adjacent to the TSBD building. . . . She said that she was looking at the President's car at the time and saw the President straighten up in the back and then slump over on his side. . . . She estimated that the President was less than fifty feet away from her when he was shot, that the car slowed down almost coming to a full stop and then started off again." **Analysis:** as she says she saw the President straighten up in the back and then slump over on his side before the limo slowed down, she is describing Kennedy's reaction in frames 190-224, and not the head shot, which happened after the limo slowed down. **First shot hit 190-224.**

Mary Sue Dickerson (3-19-64 statement to the FBI, 22H644) "On November 22, 1963, at the time President John F. Kennedy was assassinated, I was standing at the curb on the north side of Elm Street about equal distance between the point where the President was shot and the west end of the Texas School Book Depository." (Oral History interview for the Sixth Floor Museum, 7-29-10) (When complaining about conspiracy theorists) "There's just been so much misinformation. Well, Billy Lovelady was standing on the front there, and so many people since then thought that was Oswald. But, y'know it wasn't. It was Billy, and he was the most innocent, as could be." (Article by Beverly Shay in the 11-01-11 online edition of Now Magazine) "Mary Sue (Sue) Randall Bennett will never forget where she was on Friday, November 22, 1963. She was on the curb in front of the Texas School Book Depository in Dealey Plaza. She worked on the fifth floor for Allyn and Bacon Publishers, one of the many publishing firms in the building. "I was so excited to be on the street that day. And then," Sue paused, "the motorcade drove right in front of me, well us," she amended. "I was looking at the handsome, young president, admiring his lush hair, and he looked right at me! My heart fluttered, and I knew I was part of history in the making. I just didn't know how intently a part of history." As she was making eye contact with the president of the United States, several things occurred at once. She heard what she thought were fire crackers, which initially seemed so celebratory, but then he slumped forward. Sue realized something was very, very wrong, but her mind refused to process it. "People screamed and ran, but it all seemed to be in slow motion. I remember turning and walking back toward the building, noticing one of my associates was still standing near the front door as he had been when I came out. I don't know if it had even registered with me yet that the president had been shot," Sue stated, as dazed now as she had been then." **Analysis:** from her 1964 description of her location at the time of the shooting and her 2011 description of the shots, it seems clear Mary Sue thought Kennedy was hit by the first shot or firecracker sound, long after he'd passed his location at frame 160 of the Zapruder film. **First shot hit 190-224.**

Mary Lea Williams (3-20-64 statement to the FBI, 22H682) (accompanied by Mrs. Sue Dickerson, Billie Clay, Ruth Hendrix, and Mrs. John Hawkins and her four year old son John) “Our group took up a position along the motorcade route about halfway between the first and second light poles on the curbside slightly west of Depository building. We were on the north side of Elm Street...Following the shooting of President John F. Kennedy, we continued to stand in that area for another five to ten minutes...I do not recall having ever seen Lee Harvey Oswald at any time on or prior to November 22, 1963.” **Analysis: too vague.**

Betty Jean Thornton (11-24-63 FBI report, CD5 p.63) (On Oswald) “she had never seen him before as far as she knows...she was standing on the street when the President’s car passed by and she heard what she thought was a number of firecrackers.” **(3-23-64** statement to the FBI, 22H677) “On November 22, 1963, at approximately 12:35 PM, I was standing with Jane Berry...on Elm Street in front of the Texas School Book Depository Building to watch a motorcade bearing President John F. Kennedy pass by. As the car in which the President was riding passed by, I heard what I thought were firecrackers being discharged, but I did not actually see the President hit with any shots.” **Analysis:** as she didn’t hear any shots until Kennedy was passing by, and as she was far west of where Kennedy was at Z-160, she failed to hear a shot as early as Z-160. Had no recollection of Oswald **Number of shots??? First shot 190-224.**

Jane Berry (11-25-63 FBI report, CD5 p.42) “Just as the car was passing by her, she heard a rifle shot. A few seconds later, she heard a second and third shot. She observed President Kennedy slump over and everyone began falling to the ground or running...It sounded as if it had been fired from a position west of where she had been standing.” **(3-19-64** statement, 22H637) “On November 22, 1963, at approximately 12:35 PM, I was standing in front of the Texas School Book Depository with Betty Thornton...As the motorcade passed by the building I heard three shots and observed the President slump over in the automobile in which he was riding. (On Oswald) “I don’t recall having seen him around the Texas School Book Depository Building.” **Analysis:** as she heard a second and third shot “a few seconds later,” without mention of a gap between them, she probably heard them close together. As she heard the first of the three shots as the limo was passing by her, and she was far west of Z-160, she heard no first shot miss. **First shot 190-224. Probable first shot hit. Last two shots probably bunched together.**

The Last Wave

As the limousine cruises down Elm Street in Z-161, Kennedy is looking ahead.

But the crowd by the Thornton Freeway sign calls out, as seen in the Betzner photo at Z-186 (1 ½ seconds later).

And Kennedy smiles and waves back, as seen in Z-188.

But then, his head jerks to the right and his hand falls across his face, as seen in Z-206 (1 second later).

By Z-225 (1 second later), he has clearly been hit, at least once, probably twice.

The Last Wave

The testimony of those standing near the Thornton Freeway sign are particularly important in establishing the time of the first shot. As we've seen most have said Kennedy had already passed them when the first shot rang out, and none of them said he had yet to reach them. A number of others have said they saw Kennedy waving just before the first shot. This wave suddenly stopped around Z-190, a likely moment of impact according to the Zapruder film jiggle analysis. Convincingly, not one witness near the Thornton Freeway sign said that Kennedy had yet to reach them when the first shot rang out, and no eyewitnesses who mentioned Kennedy waving said he resumed waving after the first shot rang out.

Mary Woodward (11-23-63 newspaper article Witness From the News Describes Assassination written by Woodward for the Dallas Morning News) "We decided to cross Elm Street and wait there on the grassy slope just east of the Triple Underpass... We had been waiting about half an hour when the first motorcycle escorts came by, followed shortly by the President's car. The President was looking straight ahead and we were afraid we would not get to see his face. But we started clapping and cheering and both he and Mrs. Kennedy turned, and smiled and waved, directly at us... After acknowledging our cheers, he [JFK] faced forward again and suddenly there was a horrible, ear-splitting noise coming from behind us and a little to the right. My first reaction, and also my friends', was that as a joke someone had backfired their car. Apparently, the driver and occupants of the President's car had the same impression, because instead of speeding up, the car came almost to a halt... I don't believe anyone was hit with the first bullet. The President and Mrs. Kennedy turned and

looked around, as if they, too, didn't believe the noise was really coming from a gun...Then after a moment's pause, there was another shot and I saw the President start slumping in the car. This was followed rapidly by another shot. Mrs. Kennedy stood up in the car, turned halfway around, then fell on top of her husband's body... The cars behind stopped and *several* men--Secret Service men,--I suppose-- got out and started rushing forward, obstructing our view of the car... About ten feet from where we were standing, a man and a woman had thrown their small child to the ground and covered his body with theirs. Apparently the bullets had whizzed directly over their heads." (12-7-63 FBI report, 24H520) "She stated she was watching President and Mrs. Kennedy closely, and all of her group cheered loudly as they went by. Just as President and Mrs. Kennedy went by, they turned and waved at them. Just a second or two later, she heard a loud noise. At this point, it appeared to her that President and Mrs. Kennedy probably were about one hundred feet from her. There seemed to be a pause of a few seconds, and then there were two more loud noises which she suddenly realized were shots, and she saw President Kennedy fall over and Mrs. Kennedy jumped up and started crawling over the back of the car. She stated that her first reaction was that the shots had been fired from above her head and from possibly behind her." (12-23-63 FBI report, recounting a 12-5-63 discussion between U.S. Attorney Barefoot Sanders and an FBI agent, CD205, p39) "a reporter for the Dallas Morning News, name unrecalled, has advised him that four of the women working in the Society Section of the Dallas Morning News were reportedly standing next to Mr. Zapruda when the assassination shots were fired. According to this reporter, these women, names unknown, stated that the shots, according to their opinion, came from a direction other than from the Texas School Book Depository Building." (3-24-64 testimony of Mark Lane before the Warren Commission, 2H32-61) "on November 23, 1963, the Dallas Morning News ran a story by Miss Woodward, and I have since that time spoken with Miss Woodward by telephone, and she has confirmed portions--the entire portion which I will quote from now--in her conversation with me. That is, that as she and her three coworkers waited for the President to pass, on the grassy slope just east of the triple overpass, she explained that the President approached and acknowledged their cheers and the cheers of others, 'he faced forward again, and suddenly there was an ear-shattering noise coming from behind us and a little to the right.' Here we have a statement, then, by an employee of the Dallas Morning News, evidently speaking--she indicated to me that she was speaking on behalf of all four employees, all of whom stated that the shots came from the direction of the overpass, which was to their right, and not at all from the Book Depository Building, which was to their left." (Mark Lane's comments regarding Woodward at the Associated Press Managing Editors Convention in San Diego, California, 11-17-66, as published in an AP story found in the 11-27-66 Eugene Register-Guard.) "The press found Mary Woodward over there. In fact, she works for the press--the Dallas Morning News--and she wrote her own article, published in the Dallas Morning News on Nov. 23, and she said: 'I heard the shots. It was a horrible ear-shattering sound coming from directly behind me, from behind the wooden fence on the top of the grassy hill.'" (Lane had, apparently, presented his interpretation of Woodward's words as if it was a direct quote.)

(Interview in The Men Who Killed Kennedy, broadcast 1988) "One thing I am totally positive about in my own mind is how many shots there were. And there were three shots. The second two shots were immediate. It was almost as if one were an echo of the other. They came so quickly the sound of one did not cease until the second shot. With the second and third shot I did see the president being hit. I literally saw his head explode. So, I felt that the shots had come, as I wrote in my article, from behind me and to my right, which would have been the direction of the grassy knoll, and the railroad overpass." (11-21-93 Reporters Remember conference, as quoted in Reporting the Kennedy Assassination). "(We) stationed ourselves just down from the School Book Depository building and waited for the parade to come by.) And we were chatting, and as we were talking, I looked up at the grassy knoll. And I said to my friends, 'That's a very dangerous-looking spot to me, it must be, there must be a lot of security up there, because it looks a perfect spot, if somebody wanted to do something.'

And then the motorcade came along and I couldn't believe it: finally, I'm gonna see Jacqueline Kennedy, and she's looking in the other direction. So I yelled and I said 'Please look this way!' And they looked right at us, waved, and at that moment, I heard a very loud noise. And I wasn't sure what it was at that point, and I turned to my friends and asked 'what was that; is some jerk shooting off firecrackers?' And, uh, then I heard the second one, and this time I knew what had happened, because I saw the president's motion, and then the third shot came very, very quickly, on top of the second one. And that time, I saw his head blow open, and I very well knew what had happened by that point...we waited for just a few minutes... and walked back to the Dallas Morning News...I started writing my story, and I wrote it exactly as I knew it...And to this day, I think I wrote it correctly...The only thing that I guess I got myself in a little bit of controversy about, I said that the shots appeared to have come from behind me and to my right...I didn't say they did come from that direction...I had spoken to my friends just prior to the event, suggesting that the grassy knoll would be the perfect spot for an assassin... when it happened, I naturally expected it to have come from where I had predicted it would come from. So in reality, I do believe they did come from the School Book Depository Building. So I get a little bit upset when I get put into the other column... I never spoke to Mark Lane in my life, except to say I couldn't speak to him." **Analysis:** while the recollections of many if not most witnesses get wilder and wilder as they get older, Ms. Woodward has in recent years been trying to bring hers in line with the official story. In the 1993 conference quoted above, she bent over backwards to let the good old boys in the journalism profession know she was not a "conspiracist." To no avail. Her assertion that the last two shots were bunched together locks her forever in the conspiracy camp. Her words are completely at odds with the LPM scenario--she says the President was past her when the first shot rang out, she says the limousine slowed down after the first shot, she said the President slumped down in his seat after the first of two closely grouped together shots. It was only in recent years that she started adding on that this last shot was the head shot. While some LPM defenders might choose to focus on Woodward's repeated assertion that the first shot missed, they will have to overlook that she says the President looked around after this shot—and that it came after the wave of his hand (which can be seen at frame 188 of the Zapruder film). **First shot hit 190. Last two shots bunched together (with the last shot after the head shot).**

Aurelia Alonzo, Margaret Brown, and Ann Donaldson were Woodward's companions on November 22, 1963. (12-7-63 FBI report, CD7 p.19) "Ann Donaldson...Margaret Brown...and Miss Aurelio Alonzo...were interviewed December 6, 1963...All furnished the same information as that previously furnished by Mary Elizabeth Woodward." **Ann Atterberry** (formerly Donaldson) (1-5-92 article in the Dallas Morning News) "Another journalist friend, Ann Atterberry, was on the curb in Dealey Plaza that afternoon with a couple of friends. Like Tom, she heard three shots, no more, no fewer. Unlike some of the professional theorists, she has not shifted her memories later to fit the latest line-- she wrote an eyewitness account for her hometown paper that afternoon and thus is on the record for what she saw and heard." (9-5-93 article in the Dallas Morning News) "Ann Atterberry, who works on The Dallas Morning News' library staff, was probably closest to the president when he was shot... 'The youngest member of our group, Mary Elizabeth Ann Woodward, saw Kennedy hit, but he was already slumped down when I saw him. We halfway had to carry Mary Elizabeth back to the newspaper, she was so upset. I phoned in an eyewitness account to my hometown newspaper in Jackson, Miss., and reported that I heard three gunshots. I guess that's why no conspiracy theorists have bothered me over the years. Mary Elizabeth was so troubled by what she'd seen that she went off and joined the Peace Corps.'" (11-16-03 article in the San Francisco Chronicle travel section) "Jack and Jackie both looked pleased, and relieved," Atterberry said. "As they passed by us they waved, and they both made eye contact with us." Tears moistened her eyes, and her voice cracked. "I've often wondered if the four of us were the last thing he ever saw." At almost the same instant, she heard the first crack of gunfire. "My first reaction was that it was a firecracker," she said. "I thought that was awfully rude. I was just turning to see where

the sound came from when I heard the second shot. Just as I realized what it was, I heard the third shot, and then there was no doubt in my mind. We all burst into tears. It was absolute chaos. People on the knoll threw themselves on the ground. A motorcycle fell over and was left in the middle of the street. People were running everywhere." (5-29-05 article for The Independent on Sunday, found on the BNET Business Network website) "We saw them round the corner and I heard what I thought were firecrackers and looked around to see where the noise came from. I then heard two more shots and saw the motorcade speed away and people fall to the ground. It seemed unreal and then I felt horror. We headed back to the paper crying. Later we were interviewed by the FBI and the CIA. It was only recently that I've been comfortable talking about it because of the negative impact it had on the city of Dallas and on the Dallas Morning News, where I worked until I retired in 1999. In the wake of the assassination the paper was reviled. It had run an ad that morning taken out by a group criticizing Kennedy's politics. It affected me deeply, just the mental anguish of it. Most people don't know I was a witness. But I don't wish that I hadn't been there. It was a moment in history and it was one of the most momentous things in my life." (2-17-09 post by Honorfligh...@Aol.com, discussing personal contacts with eyewitnesses, found on the alt.assassination.JFK newsgroup) "I have spoken with one, Ann Atterberry, about 21 years ago. Ann described for us in still mournful detail that approximately one second or so before she heard the first very loud shot JFK then Jackie were both looking towards her and she was absolutely thrilled by that. JFK had also started waving towards her (which thrilled Ann even more) and then JFK made direct eye contact with Ann, THEN the first of 3 shots happened, and JFK immediately quickly reacted to being hit. As anyone can clearly see JFK started his wave only a second or two BEFORE he first "disappeared" behind the sign in the Zapruder film. She also described that one of the shots most definitely came from her right. (she was standing on the sidewalk street curb between the depository and the GK picket fence)." (10-27-09 Dallas Morning News article on Atterberry's death) "'In the first two frames of Zapruder's film, the four of us show,' she said recently. Ms. Atterberry said she looked up at the crack of the first rifle shot. 'I thought it was fireworks,' she said. 'I thought that was really rude and socially unacceptable. I was looking to see where the noise came from. I heard two more shots and looked around, and the motorcade was speeding away.' The friends cried all the way back to the newspaper, several blocks away." **Analysis:** While it appears that all three of these women remembered the shooting much the same as Woodward, we can't be absolutely sure. **Probable first shot hit 190 (X 3). Last two shots probably bunched together (with the last shot after the head shot). (X3).**

A.J. Millican (11-22-63, 19H486) "I was standing on the North side of Elm Street, about half way between Houston and the Underpass... Just after the President's car passed, I heard three shots come from up toward Houston and Elm right by the Book Depository Building, and then I immediately heard two more shots come from the Arcade between the Book Store and the Underpass, and then three more shots came from the same direction only sounded further back... Then everybody started running up the hill. A man standing on the South side of Elm Street was either hit in the foot or the ankle and fell down..." **Analysis:** Millican had trouble differentiating shots from echoes. He is probably describing three shots. Since Millican said he was "halfway to the underpass", and that the limo was past him when the first shot rang out, he's certainly not talking about a first shot at frame 160. **Heard eight shots? First shot 190-224.**

Willis Country

As 10-year old Rosemary Willis rounds the corner of Houston and Elm in the Martin film,

she runs into history in the Zapruder film. Here at Z-133, she is passing the fountain.

By frame 193 she is slowing down.

By frame 202, a half-second later, she's come to a dead stop, precisely at the moment her father snapped a picture.

Willis Country

By now, it's become quite clear that most people heard three shots, and that the last two were bunched closely together. However, we still need to complete our trek across the Plaza to get the full picture. Those in what we'll call "Willis Country" were on the south side of Elm Street, but to the west of Houston Street.

Rosemary Willis is the little girl seen running in the Zapruder film, as discussed on the Finding the Right Time slide. (11-8-78 HSCA staff interview, summarized in HSCA Report, vol. 12, p.7) "Ms. Willis said she was aware of three shots being fired. She gave no information on the direction or location of the shots, but stated that her father became upset when the policeman in the area appeared to run away from where he thought the shots came from; that is, they were running away from the grassy knoll." (6-3-79 article by David Lui, as found in the Syracuse Herald Journal) (When asked why she stopped chasing the Presidential limousine) "I stopped when I heard the shot." (Interview with Dallas Times-Herald reporter Marcia Smith-Durk, published 6-3-79) "In that first split second, I thought it was a firecracker. But maybe within one tenth of a second, I knew it was a gunshot...I think I probably turned to look toward the noise, toward the Book Depository." (6-5-79 UPI article found in the Reading Eagle) "I heard three shots and they all came from across the street from the direction of the book depository...Oswald was up there as clear as can be. I think he was up there on purpose to make people think he was the one. The sounds I heard came from the book depository but they weren't necessarily the shots that killed him. Someone with a gun with a silencer could have been in the gutter where they later found shells, or on the railroad trestle or behind the wall." (11-19-93 article in USA Today) "For 30 of her 40 years, Rosemary Roach has lived trapped inside a few grainy frames of film, a little girl in a red, checked dress perpetually running across Dealey Plaza. "I will never forget it as long as I live," Roach says of the day three decades ago, when she watched the assassination of John F. Kennedy, and was captured running alongside the motorcade in a famous home movie of the tragedy.

"It was the most frightening experience I ever had." But Roach says she saw more than just the shot that killed Kennedy as his limousine passed the old Texas School Book Depository. She says she saw the gunsmoke of a second gunman - evidence of a conspiracy. Thirty years after the assassination - and hundreds of books, movies and documentaries on the subject - conspiracy theories abound, undiluted even by a spate of new analyses that agree with the Warren Commission that Lee Harvey Oswald acting alone, killed the president... For her part, Roach is sure there was a conspiracy. She says she heard four shots - not three, as was concluded by the Warren Commission. She believes she saw a man in a storm sewer near the site, a man who some theorists say was a conspirator. She insists at least one shot came from the grassy knoll, a hillock from which many believe a second gunman was firing. At the moment of the fatal head shot, she says, she spotted a puff of smoke atop the knoll. 'It was definitely gunsmoke,' Roach says." (Interview with Texas Monthly, published November, 1998) "As they made the turn from Houston to Elm Street, they'd just gone a few feet when the first shot rang out, and upon hearing the sound, my normal body reaction was to look up and follow the sound that I heard... And the pigeons immediately ascended off that roof of the school book depository building and that's what caught my eye... Next thing I know, right after that, there's another shot. And after that, there's another shot and another shot... My ears heard four shots... I really think that there were six, but I heard four and I'll tell you why... the first shot rang out. It was to the front of me, and to the right of me, up high. The second shot that I heard came across my right shoulder. By that time, the limousine had already moved further down. And that shot came across my shoulder. And the next one, right after that, still came from the right but not from as far back, it was up some. Still behind me, but not as far back as the other one. And the next one that came was from the grassy knoll and I saw the smoke coming through the trees, into the air... Fragments of his head ascended into the air, and from my vision, focal point, the smoke and fragments, you know, everything met." **Analysis:** it's a shame Miss Willis was never interviewed when her memories were fresh. In 1979, she said she heard three shots from the right, and in 1998 she said she heard three shots from the right, and then one from in front of the limousine. Did she come to believe she'd heard a shot that before she'd only theorized? If so, then it would seem she'd heard the first two shots grouped together. On the other hand, by 1998 she'd also convinced herself these shots sounded differently, and implied that the second shot came from a lower floor of the Dal-Tex Building. From this it seems likely that Ms. Willis' memories had been compromised by her exposure to too many conspiracy theories. Even so, her behavior in the Zapruder film and her confirmation that she was responding to shots is invaluable in establishing the moment of the first shot. **Heard four shots? Heard two early shots? First shot 190.**

Robert Croft is to Rosemary Willis' right in frame 193 of the Zapruder film. In the film, he can be seen snapping a picture at frame 161. This photograph is frame 18 on his roll of 22 frames. (12-3-63 FBI Airtel, FBI file # 62-109060-1388) "frame number 18 appears to show the Presidential car on Elm Street south of Houston Street just moments before the President was shot... Croft believed the last picture taken by him was taken simultaneously with the shot which killed the President. This no doubt refers to frame number 19 which is a complete blank which probably was occasioned by some malfunction of Mr. Croft's camera or some other fault." (Pictures of the Pain p.224-226, Trask interview with Croft, 4-20-88) "in this third Croft photograph, Mrs. Kennedy appears to be looking right at Croft... Quickly winding his camera, Croft takes another picture of the vehicle as it passes by his position. As he makes this fourth photo, he hears a shot, and believes that this picture was 'taken simultaneously with the shot which killed the President...' Following the shots, pandemonium broke out all around the Plaza... "I can't tell you at this point anything about the shots, numbers, or where they were. I was on my way back, as I remember, before the car ever got—it was kind of going down a hill under a railroad track. And I noticed what time it was and took off, because I was going to be late for the train..." **Analysis:** while Croft says he can't remember anything about the shots, he had a clear memory of taking his fourth photo "simultaneously with the shot which killed the President." As he has

not yet raised his camera back to his eye by frame 215 of the Zapruder film, this is probably a reference to the head shot. And yet this is the one photo which failed to come out after Croft gave his film to the FBI! In light of the FBI's refusal to look at the autopsy evidence, one can't help but wonder if this photo wasn't made to disappear. Still, since the existence of the Moorman photo and the Zapruder film were well known almost immediately after the shots, it's questionable the FBI would risk scandal over what could only have been an inferior image of the President's death. When one reflects on Croft's belief that this fourth photo was taken simultaneously with the head shot, and realizes his third photo was taken at frame 161, and that Croft makes no mention of taking this photo simultaneously with the first shot, then one should really question if there was a shot at this time. **First shot 190-224.**

Phil Willis was Rosemary Willis' father and he can be seen to Robert Croft's right, snapping his famous picture at frame 202 of the Zapruder film. (6-22-64 FBI report, CD1245 p. 46-48) "Willis advised that just about the same time that the limousine carrying President Kennedy was opposite the Stemmons Freeway road sign he heard a loud report and knew immediately it was a rifle shot and knew also the shot "had hit"...About two seconds later he heard another rifle shot which also hit, as did the third, which came approximately two seconds later. Willis said he knew from his war experience the sound a rifle makes when it finds its mark and he said he is sure all three shots fired found their mark." (7-22-64 testimony before the Warren Commission, 7H492-497) "my next shot was taken at the very—in fact the shot caused me to squeeze the camera shutter, and I got a picture of the President as he was hit with the first shot. So instantaneous, in fact, that the crowd hadn't had time to react...I proceeded down the street and didn't take any other pictures instantly, because the three shots were fired approximately two seconds apart, and I knew my little daughters were running alongside the Presidential car, and I was immediately concerned about them, and I was screaming for them to come back, and they didn't hear me...When I took slide No. 4, the President was smiling and waving and looking straight ahead, and Mrs. Kennedy was likewise smiling and facing more to my side of the street. When the first shot was fired, her head seemed to just snap in that direction, and he more or less faced the other side of the street and slumped forward." (When asked if he actually saw Kennedy when he was hit in the head) "No sir, I did not. I could not see that well, and I was more concerned about the shots coming from that building. The minute the third shot was fired, I screamed, hoping a policeman would hear me, to ring that building because it had to come from there." (2-14-69 testimony in the trial of Clay Shaw) "I cocked my camera for another picture and this loud shot went off and the first reaction was that could it be a crank or a firecracker but it was so loud and of such a sound it had to be rifle so I became alarmed. I was trying to take a picture at the moment and the reflex from the shot caused me to take one of these pictures...My two little daughters were running along down the hill paralleling the Presidential car there and I yelled to one of them, which is the first thing I did, and then I heard at least two more shots and then I started looking for them and looking down and hollering for them to come back to me and they came running back crying." (6-5-79 UPI article found in the Reading Eagle) "There's no doubt in our mind the final shot that blew his head off did not come from the depository (located to the rear of the motorcade). His head blew up like a halo. The brains and matter went to the left and rear." (11-22-85 Trask interview, p.171, Pictures of the Pain) "As I was about to squeeze my shutter, that is when the first shot rang out and my reflex just took that picture at that moment. I might have waited another moment...when that shot rang out, I just flinched and I got it...I don't care what any experts say. They're full of baloney. I've shot too many deer...no one will ever convince us that the last shot did not come from the right front, from the knoll area." (Interview in The Men Who Killed Kennedy, in episode 5, first shown 1988) "At least one shot--including the one that took the President's skull off--had to come from the right front." (Same interview, but broadcast in a different episode) "No one will ever convince me—I know damn well the shot that blew his head off, came from the right front." (Interview with Jim Marrs in Crossfire, published 1989) (About the possibility Kennedy leaned forward while behind the Stemmons Freeway sign in the Zapruder film)

"That is not right. I got the nearest, best shot while JFK was behind the sign. He was upright and waving to the crowd. A split second later he was grabbing at his throat." (About the possibility a shot came from somewhere other than the sniper's nest.) "I always thought there had to be another shot from somewhere. I have always gone against the one-gunman theory. I always thought there had to have been some help. I saw blood going to the rear and left. That doesn't happen if that bullet came from the Depository." **Analysis:** Willis is sort of the anti-Woodward. Unlike Ms. Woodward, who has tried to make her statements fit the official story, Willis has tried to make his statements fit the unofficial story, but the official story of the rest of his family. His initial impression was that the shots came from the school book depository. Perhaps realizing that he was more focused on finding his daughters after the first shot than paying attention to the shots, he eventually began saying that the last shot came from the knoll. Similarly, while he told the FBI the last two shots were two seconds apart, he told the Warren Commission that there was also a similar gap between the first two, which helped them believe that all the shots were fired by one man using a bolt rifle. As he was hurriedly looking for his daughters at this time, and yelling out, it's doubtful he was paying much attention to the time span between the first two shots. In any event, his statement that there were two seconds between the last two shots, when the LPM scenario holds there was a five second gap between these two, is an indication that the last two shots were bunched together. **First shot hit 190. Last two shots bunched together.**

Linda Willis was Rosemary Willis' older sister. She can be seen standing to the right and in back of her father in Zapruder frame 202. (7-22-64 testimony before the Warren Commission, 7H498-499) (When asked if she heard shots) "Yes; I heard one. Then there was a little bit of time, and then there were two real fast bullets together. When the first one hit, well, the President turned from waving to the people, and he grabbed his throat, and he kind of slumped forward, and then I couldn't tell where the second shot went... I was right across from the sign that points to where Stemmons Freeway is. I was directly across when the first shot hit him...I wasn't very far away from him. (When asked if she was about 25 feet away from Kennedy when he was hit in the head) "About that...I heard the first shot come and then he slumped forward, and then I couldn't tell where the second shot went, and then the third one, and that was the last one that hit him in the head. No; when the first shot rang out, I thought, well, it's probably fireworks, because everybody is glad the President is in town. Then I realized it was too loud and too close to be fireworks, and then when I saw, when I realized that the President was falling over, I knew he had been hit." (11-29-66 Interview with Josiah Thompson, as recounted in Six Seconds in Dallas, 1967) "In November 1966...Linda Kay Willis told me she thought the shots were evenly spaced, while earlier she had told the Warren Commission she thought the last two were bunched." (When asked if it seemed clear Kennedy was hit by the first shot, Connally the second, and then Kennedy the third) "Absolutely." (When asked if this was her conviction all along) "We've had these opinions ever since the night." (When asked what they'd have said should the government have told them Kennedy and Connally were wounded by the same bullet) "We would have said that's wrong." (1978 Interview with Jim Marrs, published in Crossfire, 1989) "I very much agree that shots came from somewhere other than the Depository. And, where we were standing, we had a good view." (11-7-78 HSCA staff interview, summarized in HSCA Report, Vol. 12 p.8) "The only information she provided relevant to the shots was that she had a distinct impression that the head wound to President Kennedy was the result of a front-to-rear shot. She also heard three shots and saw the President's head "blow-up." (The Men Who Killed Kennedy, broadcast 1988) "The particular head shot must have come from another direction besides behind him because the back of his head blew off...The back of his head blew off." (1998 interview with Texas Monthly) "when the shots rang, my impression was firecrackers at first. But the report was loud and came again and again...I saw the President's hands come up to his throat and then I saw the head shot and I never took my eyes away from the president during those shots." **Analysis:** as an arrow from her location at Z-193 to the Stemmons sign crosses the President's position at Z-190, she is identifying a first shot hit at Z-190, followed by two quick shots in rapid

succession. While she believes the last shot was the head shot, the shots were fired in such rapid succession it may have been difficult for her to distinguish. **First shot hit 190. Last two shots bunched together.**

Marilyn Willis was the mother of the Willis girls and the wife of Phil Willis. She watched the shooting from the wall running north to south on the east side of the grassy infield. (6-19-64 FBI report, CD1245 p. 44-45) "Mrs. Willis advised when the motorcade passed on Elm Street in front of where she was standing she heard a noise that sounded like a firecracker or a backfire. A few seconds following this she stated she heard another report and saw the top of President Kennedy's head "blow off and ringed by a red halo." She stated she believes she heard another shot following this." (11-29-66 Interview with Josiah Thompson, as recounted in Six Seconds in Dallas, 1967) (When asked if she felt Kennedy was hit by the first shot, Connally the second, and Kennedy the third) "Yes, that's right." (When asked if she'd felt this right away) "Oh, yes, from the very first thing." (When asked if it seemed clear) "That's right. The Warren Commission didn't seek us out and finally Linda and I were interviewed a long time later. But at home we all agreed. We stayed home there for a week just glued to the television. And we agreed all along as to how and what happened." (When asked again about when they all agreed) "The night that it happened." (2-14-69 testimony in the trial of Clay Shaw) (When asked how many shots) "I heard three." (When asked about the first one) "I thought it was a firecracker. (When asked about the second shot) "I knew it was a gunshot then." (And what the effects were of the second) "The second noise drew my attention back to the motorcade." (And what about the third?) "It was a loud gunshot... On the third shot his head exploded and went back and to the left." (The Men Who Killed Kennedy, broadcast 1988) "The head shot seemed to come from the right front. It seemed to strike him here and all the brain matter went out the back of his head. It was like a red halo, a red circle with bright matter in the middle of it." (When asked her clearest memory) "The head shot--seeing his head blow up—I can see it just as plain—it's red, it's cone-shaped, going back." (Interview with Robert Groden for his video, The Case for Conspiracy, 1993) "His head was back this way (she leans her head back) It looked like a red halo--just matter coming out of his head." (When asked from where she thought the shots derived) "Well, the results of what I saw, his head exploded, absolutely exploded. I would think that the shots came from behind the picket fence, which borders the top of the grassy knoll." (When asked where the wound was) "This side" (She grabs her head above her right ear, exactly where the large wound is on the Zapruder film) like this, and it goes to the back. (She leans her head back) His head was like this, see." (1998 interview with Texas Monthly) "all of a sudden we heard the noise. To a woman I said "Oh, they're shooting firecrackers" Bang. Bangbang, you know it went. Then I said "No, that's gunshots." Then I looked up and his head was blown up like that. I heard three shots." **Analysis:** Mrs. Willis initially believed there was a shot after the headshot but then "corrected" her memory, probably for the same reasons her husband corrected his memory about the origin of the last shot: family unity. Since she remembers the last shots as bangbang, moreover, she may have convinced herself she was simply wrong. Still, her proximity to the school book depository was such that she may have heard the shot close enough to the moment of impact that she could have looked to Kennedy a split second after the impact, just in time to see the particles disperse into the air. As from her angle it would have been very difficult to determine if the cloud of brain, blood, and bone went back or forwards, her statement that it went back was probably influenced by the family decision to believe the last shot was fired from the knoll. **First shot hit 190-224. Last two shots bunched together (with the last shot after the head shot).**

Mrs. Dolores Kounas stood back behind Phil Willis, near Linda Willis. (11-23-63 FBI report, 22H846): "After the car had passed her point and was almost to the underpass she heard a noise like a firecracker. She stated that there were three of these noises which she now knows were shots equally spaced by a few seconds and that it sounded as though these shots were coming from the triple underpass. She stated she looked in that direction but was unable to see the car in which President

Kennedy was riding due to the mass of people in front of her.” (**3-23-64** statement to the FBI, 22H659), “I recall that moments after the car bearing President John F. Kennedy passed my position, I heard a loud report which I first thought to be a firecracker. Following the second shot, however, I then heard screaming and saw people running and I then believed the reports I had heard were gunfire...I had thought the shots came from a westerly direction in the vicinity of the viaduct.” **Analysis:** as she was standing approximately forty feet from where the limousine was at frame 160, near the corner of Elm and Houston, it’s doubtful she would describe this President’s location at frame 160 as halfway to the underpass. As she describes chaos breaking out after the second shot, moreover, this would appear to be the head shots, and yet she heard a shot after this. Even though she stated the shots were equally spaced, that she describes the last shot as coming a few seconds after the second shot, indicates she probably heard the last two shots bunched together. **First shot hit 190-224. Last two shots probably bunched together (with the last shot after the head shot).**

Roberta Parker (12-16-63 FBI report, CD205 p.504) “The car in which President Kennedy... (was) riding had passed Mrs. Parker only a short distance when she heard what she thought was a shot. The shot sounded to her as though it had come from a cement memorial building to the north of the Texas School Book Depository on Elm Street. She looked in that direction but saw nothing....During this time, she heard two additional shots.” (**3-20-64** statement to the FBI, 22H657) “On November 22, 1963, at the time the motorcade was passing the Texas School Book Depository Building and President John F. Kennedy was assassinated, I was standing across the street from the Texas School Book Depository Building entrance with Dolores Kounas and Lloyd R. Viles.” **Analysis:** last two shots grouped together in the first FBI report. **Probable first shot hit 190-224. Last two shots probably bunched together.**

Lloyd R. Viles (3-20-64 statement to the FBI, 22H678) “On November 22, 1963, at the time President Kennedy was assassinated, I was standing across Elm Street from the main entrance of the Texas School Book Depository Building with Mrs. Dolores Kounas and Mrs. Roberta Parker.” **Analysis: too vague.**

Hugh Betzner was on Elm Street, 20 feet or so to the east of Phil Willis. (**11-22-63** statement to Dallas Sheriff’s Department, 19H467) “I then ran down to the corner of Elm and Houston Streets, this being the southwest corner. I took another picture just as President Kennedy’s car rounded the corner...I ran on down Elm a little more and President Kennedy’s car was starting to go down the hill to the triple underpass. I took another picture as the President’s car was going down the hill on Elm Street. I started to wind my film again and I heard a loud noise. I looked up and it seemed like there was another loud noise in the matter of a few seconds. I looked down the street and I could see the President’s car and another one and they looked like the cars were stopped. Then I saw a flash of pink like someone standing up and then sitting back down in the car...I cannot remember exactly where I was when I saw the following: I heard at least two shots fired and I saw what looked like a firecracker going off in the president’s car. My assumption for this was because I saw fragments going up in the air. I also saw a man in either the President’s car or the car behind his and someone down in one of those cars pull out what looked like a rifle. I also remember seeing what looked like a nickel revolver in someone’s hand in the President’s car or somewhere immediately around his car. Then the President’s car sped on under the underpass. Police and a lot of spectators started running up the hill on the opposite side of the street from me to a fence of wood. I assumed that was where the shot was fired from at that time. I kept watching the crowd. Then I came around the monument over to Main Street. I walked down toward where the President’s car had stopped.” (**11-23-63** article by Betzner for UPI) “I was standing on the southwest corner of Elm and Houston Streets as the motorcade came along. I began taking pictures—one on Houston Street and one as the President’s car rounded the corner. I took another picture of the limousine as it drove off down the hill, and I had just lowered the camera and

was rewinding the film when I heard the first shot. I looked up. There was another shot and I saw what looked like a puff of paper splattering apart outside the car. I couldn't see the President any more, but someone in the back of the limousine pulled out a big long gun. It looked like a rifle... Suddenly the motorcade took off fast under the viaduct... I went around to the other side of the monument, and it looked like the police thought the shots came from a wooden fence on top of the hill. So I went up there, because I figured that if he got shot from the fence, I might have a picture of the man who did the shooting. My last picture was taken looking that way." **Analysis:** as Betzner took his photo at frame 186, the shot he heard as he started to wind his film was not the shot at frame 160 in the LPM scenario, but at 190 or afterwards. As the fragments he saw go up in the air were almost certainly the blood, brain, and bone ejected by the head shot, the next shot he heard was the head shot, meaning the first shot he heard most logically caused the neck wound. While it's possible he missed an early shot at frame 160, this seems unlikely, as he was directly across the street from the Texas School Book Depository at the time. It seems more likely he missed one of the last two shots heard close together, and interpreted them as one shot. **Only heard two shots. First shot hit 190-224.**

Hank Farmer is a little known-witness who apparently stood on the south side of Elm in this area. (11-22-63 FBI memo from Joe Pearce to J. Gordon Shanklin, as described in *The Zapruder Film* by David Wrone, 2003) "At 5:36 PM on November 22, he telephoned the Dallas FBI office to report he had seen President Kennedy hit in the face by a bullet from the front and Governor Connally hit in the back by a bullet fired from the 'opposite direction'." (12-14-63 FBI report, CD205 p.34) "He waited in the park at the corner of Houston and Elm Streets and watched the motorcade come west off Main Street on to Houston Street and then west on Elm. He stated he saw President Kennedy appear to fall over in the car and then he saw Governor Connally also appear to fall over. He did not hear any shots fired and did not know what happened. There was confusion with many people running in all directions, and then the President's car drove off at a high rate of speed." **Analysis:** while Farmer's interpretations of the direction from which the shots were fired is interesting, he, apparently did not hear the shots themselves. As a consequence, his words carry little weight. Even so, it is intriguing that the FBI report failed to report Farmer's impression the head shot came from in front of Kennedy. That people started running after Connally fell into the car but before the limo sped off is also intriguing, as it re-affirms our impression that the crowd panicked after the fatal head shot, and not before. **Too vague.**

Down on the Corner

Above: a frame from the Dorman film, with the Towner family filming the limousine.

Above: a crop from Zapruder frame 133, depicting Howard Brennan sitting on the eastern wall of the fountain. Pierce Allman, Amos Euins, Robert Fischer, Robert Edwards and John Martin are somewhere nearby.

Above: a photo by James Altgens, depicting the crowd along Houston Street, with Elm Street in the distance.

Above: a frame from the Towner film, depicting the crowd on the east side Houston and Elm

Down on the Corner

As standing on the southwest corner of Elm and Houston, with the grassy knoll on the left and the school book depository on the right, would put one in perfect position to judge the source of the shots, the recollections of those on this corner are particularly vital.

Jim Towner was standing on the southwest corner of Elm and Houston, taking pictures, along with his daughter and his wife. His wife, Pat Towner, never publicly commented on the assassination. (Article in Life Magazine, **11-24-67**) "Towner remembers noticing people in some of the Depository windows, one of whom he now believes was Oswald... At the sound of the shots, (his daughter Tina) shouted, "some dummy is lighting firecrackers!" But her father, an experienced rifleman, knew better. He sprinted down the motorcade route and took one final picture." (**Pictures of the Pain, p.217**) (After taking a picture as the Presidential limousine turned the corner) "Jim Towner had rushed a number of yards further down Elm Street. Somewhere along the way he became aware that the noise was caused by a high-powered rifle. As the presidential, vice-presidential and follow-up vehicles had quickly departed, he now took a picture of activity further down Elm Street." (**Summary of Towner on the Sixth Floor Museum website**) "Having served in the military, Jim Towner recognized gunfire immediately. He later recalled, 'Pat said, 'Oh mercy, some fool is shooting firecrackers.' I said, 'That's no firecracker. That's a .30-06 rifle.'" **Analysis:** The last Towner picture was taken from approximately 40 feet further down the street from where he had been standing, and was taken at least 20 seconds after the last shot had been fired. This might be taken as an indication that he didn't respond to the gunshots until after the last one was fired, and that there was not a five second gap between the last

shots. It's also intriguing that Towner is quoted in both Pictures of the Pain and on the Sixth Floor Museum website, when he never gave an official interview. Perhaps he just didn't want to bother. Or perhaps he knew his memory was too muddled to be of much value. The three accounts above vary, after all, on the only bit they have in common--on the circumstance of Towner's realizing he was hearing rifle shots. **Too vague.**

Tina Towner was with her father on the corner, filming Kennedy's turn onto Elm with a movie camera. (Article in Life Magazine, **11-24-67**) "was using a movie camera to film the procession...up to within moments of the first shot. She stopped when all she could see was the rear of the President's car. At the sound of shots she shouted "Some dummy is lighting firecrackers." (Article in Teen Magazine, **6-19-68**, as quoted in Pictures of the Pain, p. 217) "Now I was beginning to leave when I heard the sky fall in--the loudest crack of a rifle I had ever heard! At that time I had the least notion it was a gun. The truth of the matter was that I thought it was a firecracker." (After hearing another boom I) "looked around to see where they were coming from. Finally, the third and last boom and, with that one, I turned to look at the School Book Depository Building." (**3-30-96** oral history for the Sixth Floor Museum) "I was looking through the viewfinder, so I saw what the camera saw." (Interview in JFK: The Lost Bullet, broadcast **11-20-11**) "My dad recognized the gunshot." (The former Miss Towner, now Mrs. Pender, says this while looking at a copy of Kennedy's limo in the location historian Max Holland has proposed Kennedy's limo was at the time of the first shot. The program does not quote her on the accuracy of this location, and it's obvious to any long-time researcher why they do not. At Holland's location the limo is a good 20 feet closer to Pender than the limo was at the end of her film, which she has consistently claimed ended BEFORE the first shot was fired! The program's creators then cut to her discussing the relative closeness of the limo to the curb, and use this to suggest the first shot, if aimed at the limo when they propose the first shot was fired, could have hit a traffic light.) (**11-22-11** news report and interview on KXAN, found on the KXAN.com website. The italicized statements are additional statements found only in the televised version of this news report, as found on youtube) "*I don't know if it was the first shot, or the second shot, but somebody pulled me down to the ground...* When I couldn't see anything but the back of the limo I stopped taking pictures," said Pender. 'About that time is when the first gunshot rang out. It sounded like firecrackers. That's what I thought was going on. *My father told me that he knew what was happening. He said somebody had tried to shoot the President.*' Pender's film is part of a new documentary by National Geographic, JFK: The Lost Bullet. The channel called on Austin-based Image Trends to restore several films from that day. 'We know that film captures a lot more than is normally shown,' said Image Trends CEO Dan Sullivan. The company normally uses a custom machine and software to restore Hollywood features. The restoration revealed several new details of that day. 'We were able to gather information about images beneath the bridge, the railroad bridge,' said Sullivan. 'We found out we could capture the film at 10 times the normal exposure and look into the shadows and see there was no shooter on the grassy knoll.' The main coup was determining what happened to a missing third bullet. Witnesses including Pender recall hearing three shots. 'The first bullet was actually shot way before they thought, and it hit the traffic light,' said Sullivan. 'Consequently, we went back, looked at images of the traffic light, sure enough there was a hole.' (Sullivan's comments confirm that those working on JFK: The Lost Bullet KNEW Pender thought the first shot was fired when the limo was further down the street than where they assumed it had been.)

(Tina Towner, My Story as the Youngest Photographer at the Kennedy Assassination, published **2012**) (As to whether or not she saw the President get shot) "No." (On what she heard) "Three shots." (Describing the shooting) "Standing to my left Daddy opened the viewfinder on the top of his Yashica...and captured one magnificent color photograph of the presidential limousine...At the same time, I took 8 mm movies...I looked through the viewfinder, as Daddy taught me to do, and smoothly panned the camera in motion with the limousine, as it turned left onto Elm directly in front of and

around me...I believe Daddy was about to head down the hill to get another photo, but there was not enough time before the first gunshot sounded only a second or two, if that, after I stopped filming. My first thought was that someone was throwing firecrackers out of a building window. I wasn't the only one who thought that. When I heard the first gunshot, there had been enough time for me to move back toward or onto the curb. I stopped and looked up at the buildings. I didn't see anything, but I didn't know what I was looking for. I heard three gunshots, and sometime between the first and last an unknown man grabbed my arm and pulled me to the ground. He held onto my arm until he thought it was safe to get up." (Final thoughts) "I heard three shots, which seemed equidistant apart, and sounded, to my young ears, like firecrackers." **Analysis:** as Towner's film concludes approximately 1 ½ seconds before Z-160 (Dale Myers' study of the films indicates it was more like 2.2 seconds), and as she said she was beginning to leave when she heard the first shot, it makes more sense for her to have heard this shot at Z-190 or afterward, than at Z-160. Additionally, if this first crack was as loud as she says it was, and at Z-160, it seems that more than one or two people would have looked around. It bears noting that Sixth Floor Museum Curator Gary Mack has used Towner as evidence the first shot was fired circa Z-160. To do this, however, he claims Towner has "always been specific" that the first shot came a second or two after she stopped filming--an assertion unsupported by her earliest statements. He also inches the timing of the shot she heard up a bit by claiming she stopped filming a second or two before Zapruder started filming at Z-133, when even Dale Myers, to whom Mack usually defers, acknowledges she stopped filming less than one second before Zapruder started filming. Myers, in fact, says it was .7 seconds. Myers' claim is even more problematic for historian Holland than Mack, however. You see, Holland's theory is that the first shot was fired 1.4 seconds before Z-133. This would place it, according to single-assassin theorist Myers' analysis, about .7 seconds *before* Towner stopped filming, when Towner has long insisted she heard the shot *after* she stopped filming. Holland's theory was thus thoroughly at odds with the long-time recollections of one of the witnesses the creators of JFK: The Lost Bullet used to support his silly theory. Their use of her in their program, and their hiding from their viewers that she disagreed with the premise of their program, is a violation of the public trust. **Probable first shot 190-224.**

L.R. Terry and his statements appear in Jim Marrs' 1989 book *Crossfire*, and nowhere else. He claimed to have been standing across the street from the school book depository. His credibility is open to question. Still, there are many unidentified witnesses in this location, and he may very well have been one of them. (Interview with Jim Marrs, published in *Crossfire*, 1989) "I was right across from that book store when Kennedy was shot. I saw a gun come out of there just after I saw Kennedy and Connally go by. I could only see a hand, but I couldn't tell if (the man) was right-handed or left-handed. He did not have on a white shirt. The parade stopped right in front of the building. There was a man with him. They (investigators) could find out that the man who killed Kennedy had somebody with him. But I don't know who it is...I just saw the gun barrel and the hand." **Analysis:** it's hard to see how he could see just the hand of the shooter, and yet be so sure there was another man with him. **Too vague.**

Pierce Allman (11-22-63 report by Allman on WFAA radio, presumably around 12:50 PM, as presented on the LP *Four Days That Shocked The World*) "Just a few minutes ago, the President of the United States turned from Houston Street onto Elm Street on his way to a scheduled luncheon appearance at the Stemmons Trade Mart. And as he went by the Texas School Book Depository, headed for the triple underpass, there were three loud reverberating explosions. Nobody moved. Everyone seemed stunned. A few seemed to look around wondering who had the firecrackers. Then suddenly the Secret Service men sprang into action. The convertible bearing the President and Mrs. Kennedy sped away, and officers both plain clothes and uniformed seemed to spring from everywhere at once, guns drawn, ordering people to lie flat." (11-22-63 eyewitness report on WFAA, between 1:45 and 2:00 PM CST) "Right after Mr. Kennedy passed in front of me I heard one big explosion and my immediate

thought like most of the people standing around me was "this is firecrackers, but it's in pretty poor taste". I looked and saw the president, I thought, duck. Evidently, he was slumping at the time. The car immediately sped on. No one seemed galvanized into immediate action. The shots didn't seem rapid at all. They were pretty well spaced, reverberating shots." (When asked how far he was from the President at the time of the shots) "The car was in the middle of the street. I was on the left hand side of the street. I'd say about two--ten feet." (When asked if the car stopped at that time) "No, the car kept going. The car did not stop. The policeman immediately came over and said "All right, hit the dirt" and everyone concerned scrambled right away including this young man what the--Bill Newman, whom I did talk to right after it had happened. I, like five or six rather foolish other people, immediately ran up the knoll over there by the viaduct and looked over the fence. We saw nobody except a lot of people running around. And then I headed into the Texas School Book Depository where they were beginning to search..." (When asked if he thought the shots came from a building.) "Yes, I think that this was the consensus at the time, although now I notice Mr. Newman says he felt the shots were fired from a knoll. I think the logical place to have fired them would have been from the building and when I left a few minutes ago, they were still searching..." (When asked how many shots he heard) "Three. I heard three well spaced shots." (When asked if any of the shots could have been shots fired in return) "This is possible, however, the three I heard. I heard a boom and then a space and then another boom and it was not until after the third distinct sound, this third boom, that police were able to draw their revolvers and start firing in return. And in the course of this--they, actually, they were reluctant to fire. I imagine there was a few shots exchanged. I don't remember frankly but they were reluctant probably because of all the crowds around." (11-22-63 eyewitness report on WBAP radio, around 2:30 PM) "He turned the corner just before going under a triple underpass... Suddenly we heard a reverberating explosion. My first thought was not to look at the President...I rather looked around as if to say 'Well, someone has fireworks and it's in pretty poor taste at this moment.' The President ducked at least that's what it looked like to me. I thought, this was a natural reaction. I didn't realize at the time that he had been shot, and was slumping. There were three shots fired. They were spaced. They didn't seem to come from any automatic weapon of any kind, rather careful and deliberate aim. A Secret Service man was killed. No one seemed galvanized into instant action. Everyone was rather stunned. And suddenly the Lincoln convertible sped away at top speed." (2-3-64 Secret Service report, based on 1-29-64 interview, CD354 p4-6) "Mr. Allman stated that he was watching the parade from a position near the corner of Elm and Houston. Upon hearing the shots he ran across Elm Street to a couple who had fallen on the ground. He asked the man if he was all right; the man stated that he was. Allman then ran up an incline toward Houston Street. Upon reaching the top of the incline, he turned and ran down. He stated that he is at a loss to explain this action other than he was extremely excited and upset by the assassination. Mr. Allman then stated that he ran full speed into the Texas School Book Depository Building with intention of locating a phone and calling his television station WFAA." (2-18-64 report of the Dallas Police Department, CD950, p52) "Subject stated that he and Terrence Ford were at Elm and Houston streets watching the parade at the time President Kennedy was shot. Subject stated that immediately after the shooting he went into the Texas School Book Depository and called radio station WFAA."

(BBC program The Day The President Died, transcript found in the Weisberg Archives. Purported to be from 11-22-63, but apparently recorded afterwards, as Allman describes things only visible in the Zapruder film. Broadcast on WBAI on 11-23-64) "They turned the corner and as they came by me I broke into applause. And just after they went by me there was a big loud BOOM. It was a reverberating explosion. It was not a sharp, flat crack one normally associates with a rifle and this is why it didn't even enter my mind at the time that it could be a shot. It was just a BOOM, a big, dull sounding explosion, rather like a shotgun fired in a concrete chamber that reverberates. No one sprang into action, there were mixed reactions, everyone was sort of looking around like I was, and then another very deliberate BOOM! And I looked and the President had slumped--I thought at the time he was

ducking--but now I know of course that he was slumping. He had slumped forward, his left arm was thrown up. Mrs. Kennedy's left hand was on his left arm. The Governor and Mrs. Connally were in the jump seats, the little seats behind the front seat, and the Governor was half-turned, and it was the second shot that got him. The President--then there was another one of those dull, one of those booms. These were deliberately paced things. There was no haste, no panic, no automatic rapidity to them at all, just a Boom, Boom--BOOM! A very dramatic thing. I can't forget it at all. I keep hearing the shots. And on the third one the President then--instead of slumping forward it looked like he was--he jerked back or was thrown back a little bit. And Mrs. Kennedy then was halfway out of the seat and a Secret Service man--I presume he was--a Secret Service man was then over Mrs. Kennedy. And the car had stopped only momentarily and then immediately sped away at top speed. And there was a couple on the other side of the street who were on the ground, and immediately after this happened a policeman came toward me, drawing his gun. It was after the third shot that everything erupted, and guns appeared from all directions but they were afraid to fire, because of the crowd, and they didn't know where to fire, quite frankly. And a policeman threw me to the ground, and said "Hit the dirt," and I got up, immediately ran across the street because I thought this young couple had been hit, and I said "Are you all right?" And he was beating the ground with his fist, saying, "My God, they shot him! They shot him!" (12-14-91 AP article found in the Frederick Maryland News) "Just as they turned (onto Elm) I heard the first explosion," says Mr. Allman, who is now a public relations consultant. "That is still the descriptive term. It was not a thin, brittle, sharp sound. It was a loud reverberating sound...While I was still wondering what was going on, a second and then a third." (November 1998 interview in Texas Monthly) "So, we walked over, ended up standing on the corner, directly opposite the School Book Depository Building, and I'm standing right next to Mr. Brennan...who ended up giving a lot of testimony to the Warren Commission...the first shot, that loud explosion—it wasn't a sharp, flat crack sound at all, the first shot. It didn't enter my mind at all that it was a shot. I thought, "now that was poor taste, this is firecrackers..." Then bam!, the second one. And you realized indeed that it was shooting, then the third shot...on the second shot, I glanced up, my gaze stopped one floor below on the depository building. I saw the three guys looking out the window, looking up. And I went back to the scene on the street and it was pretty obvious Kennedy had been hit... On about the second shot, we all got down and of course popped back up as the car sped off." (11-25-98 article in the Dallas Morning News) (The caption to the accompanying photo) "Pierce Allman was standing across Elm Street from the Texas School Book Depository when he heard the shots that killed President John F. Kennedy." (From the article) "Mr. Allman said the passing of 35 years hasn't erased the images of what he saw and heard. He recalled Jackie Kennedy's pink suit and pillbox hat, the president's tanned face and a distinctive parade greeting, more a salute than a wave... The first shot was a tremendous boom. He said the shot was very close and seemed to rattle the entire plaza. 'My first thought was, if that's [a] firecracker, God that's in poor taste,' he said. 'The sound was not to the right. The sound was not to the left. It was straight ahead. Loud. Very loud,' he said. At the second shot, Mr. Allman said he looked up at the Texas School Book Depository from where he was standing at Houston and Elm streets. 'There were three guys on the fifth floor looking up at the sixth floor,' he said. He witnessed the third shot, which struck the president in the head, and watched Mrs. Kennedy crawl onto the trunk as a Secret Service agent hopped onto the car's bumper... He always tells of three shots from the book depository. 'There were three shots. And yes, I believe the three shots were from a single place,' Mr. Allman said."

(Chopped-up interview in CNN program Kennedy Has Been Shot, broadcast 11-16-03) "I took a position on a corner, right across the street from the Depository Building. And as the motorcade approached, I was caught up in it like everybody else. There were the motorcycle escorts. And then as the limo bearing the Connallys and the Kennedys came, I was riveted by the appearance of the Kennedys. They just looked great. They looked like a first couple should look. And then as they turned the corner, there was this loud, explosive sound." (Later) "Things were happening in the limousine. Mr.

Kennedy had -- his arms had gone up and he was beginning to topple to the left. And then Jackie came out of her seat and was coming up over him. And about that time, I guess a Secret Service man from the following car jumped over the left rear fender of the car and covered them both. And they sped off." (Later) "It looked to me like the President was shot. If, in that very brief, chaotic visual moment, if what I saw and registered was accurate, it looked to me as if it was fatal." (11-24-03 article in U.S. News and World Report) "There were three shots. They were very distinct. Later on, in asking to re-create the time sequence, my timing on it was six and a half seconds. It was a very, very vivid memory. Mr. Kennedy didn't really slump. He sort of jerked up, and his arms went up and his hands went up towards his chin. As the shots continued, Jackie screamed something and tried to get up...the Secret Service man sprinted in from the trailing car and vaulted over the left rear fender and put himself on top of both of them and shoved them down. That's when they were both in the back seat and Kennedy's foot was dangling over the side." (History Channel program "Our Generation", broadcast 2007) (The shots) "And I glanced over here at the Depository Building, and then boom the second shot..." (After the shots) "A cop he got off his motorcycle and he said "everybody get down" and I bounced right back up and ran across the street and picked up Bill and Gayle Newman--I didn't know their names of the couple at the time--they had two little kids--and I said "Are you okay?" And he said "Yeah, but they got the President. They blew the side of his head in." **Analysis:** as Allman raced across the street to the knoll after the shots, and as he didn't logically deduce the shots came from the building until afterward, it seems clear he did not initially believe he heard three loud shots come from the building. Although he said the limo was near him at the time of the shots, and that the shots were well-spaced, which support the LPM scenario, he also said he couldn't remember if the cops returned fire, indicating he really didn't remember how many shots he'd heard and whether or not they came from the same location. In his initial comments, furthermore, he'd indicated that he'd seen Kennedy slump as a response to the first shot, which is in absolute disagreement with the LPM scenario. So he's a hard one to pigeon-hole. His latter-day statements seem a hodge-podge of his actual memories and memories implanted from reading about the case. He most certainly never saw Kennedy's foot dangle over the side of the limousine. If one is to give his latter-day statements any credence, in fact, one should note that his saying "we all got down" after the second shot, after his mentioning that Howard Brennan was next to him, suggests that there was a shot fired after the last shot fired from the sniper's nest. Brennan, as we shall see, could recall only two shots, and said he jumped off the wall only after witnessing the last shot fired from the sniper's nest. **Possible LPM scenario. Possible first shot hit 190-224. Last two shots possibly bunched together (with the last shot after the head shot.)**

Terrance Ford was with Allman. (2-3-64 Secret Service Report, based on a 1-31-64 interview with Ford, CD354 p4-6)) "Mr. Ford stated that he accompanied Mr. Allman to the corner of Houston and Elm streets to watch the procession; then, upon hearing shots, he retreated to a concrete building near the side of the small park bordering Elm Street, then running back towards the Texas School Book Depository." (2-18-64 report of the Dallas Police Department, CD950, p50) "Subject stated that on November 22, 1963, he and Pierce M. Allman, also with WFAA, were standing near the corner of Elm and Houston watching President John F. Kennedy's motorcade. Suddenly, three shots rang out and he and Allman started running. A few moments later they ran into the Texas School Book Depository Building where Allman used a telephone to call his radio station." **Analysis:** it's clear from the early statements of Allman and Ford that they had no inkling the shots came from the sniper's nest, across the street and above them. As they told the Secret Service and DPD that an unidentified white male pointed out a phone to them when they entered the building, and as it was later determined this man was Oswald, it seems clear neither of them were very observant that day. **Too vague.**

Howard Brennan was sitting on the Houston side of a cement wall encircling the fountain at Houston and Elm. He can be seen in Zapruder film wearing a hard hat. (11-22-63 statement to the Dallas Sheriff's Department, 19H470) "I was sitting on a ledge or wall near the intersection of Houston Street

and Elm Street near the red light pole. I was facing in a northerly direction looking across the street from where I was sitting. I take this building across the street to be about 7 stories anyway in the east end of the building and the second row of windows from the top I saw a man in this window. I had seen him before the President's car arrived. He was just sitting up there looking down apparently waiting for the same thing I was to see the President. I did not notice anything unusual about this man. He was a white man in his early 30's, slender, nice looking, slender and would weigh about 165 to 175 pounds. He had on light colored clothing but definately not a suit. I proceeded to watch the President's car as it turned left at the corner where I was and about 50 yards from the intersection of Elm and Houston and to a point I would say the President's back was in line with the last windows I have previously described I heard what I thought was a back fire. It run in my mind that it might be someone throwing firecrackers out the window of the red brick building and I looked up at the building. I then saw this man I have described in the window and he was taking aim with a high powered rifle. I could see all of the barrel of the gun. I do not know if it had a scope on it or not. I was looking at the man in this windows at the time of the last explosion. Then this man let the gun down to his side and stepped down out of sight. He did not seem to be in any hurry. I could see this man from about his belt up. There was nothing unusual about him at all in appearance. I believe that I could identify this man if I ever saw him again." (11-23-63 article in the San Francisco Chronicle, quoting an article in the Dallas Morning News) "Steamfitter H.L. Brennan told the Dallas Morning News he saw the assassin. 'He was a slender guy, a nice looking guy. He didn't seem to be in no hurry,' Brennan related. 'After the first shot, I looked up and saw him. The gun was sticking out of the window. I saw him fire a second time.'" (11-23-63 article in the Chicago Tribune) "One of these was HL Brennan, 44, a steam-fitter, who told police later, 'After the first shot I looked back and up the building wall and saw the man in the window with a gun. 'The barrel was sticking out the window. I saw him steady it, aim, and fire again.'" (11-23-63 FBI report, CD5 p12-14) "He said the automobile had passed down Elm Street (going in a westerly direction) 30 yards from where he (Brennan) was seated, when he heard a loud report which he first thought to be the 'backfire' of an automobile. He said he does not distinctly remember a second shot but he remembers "more than one noise" as if someone was shooting fire crackers, and consequently he believes there must have been a second shot before he looked in the direction of the Texas School Book Depository Building. Upon hearing the report, or reports, he looked across the street to the Texas School Book Depository, where he saw a man in a window on the sixth floor near the southeast corner of the building. The man he observed in the window had what appeared to be a 'heavy' rifle in his hands. He could not tell whether or not this rifle had a telescopic sight, as the rifle was protruding only about half its length outside the window. He was positive that after he had observed this man in the window, he saw this person take 'deliberate aim' and fire a shot. He then observed this person take the rifle from his shoulder and hold it by the barrel of the rifle, as if he were resting the butt of the rifle on the floor. He said this individual observed the scene on the street below, and then stepped back from the window." (12-18-63 FBI report, CD205 p14) "He advised that about 7 p.m., November 22, 1963, when he observed a line-up of individuals in the Dallas Police Department he selected Lee Harvey Oswald as the individual most closely resembling the person whom he had seen with a rifle in the window of the TSBD building...He stated that he now can say that he is sure that Lee Harvey Oswald was the person he saw in the window at the time of the President's assassination...Brennan stated that he was able to observe Oswald's head and shoulders in the window and possibly down as far as Oswald's belt." (1-10-64 FBI report, CD329, p7-8) "Approximately ten minutes after sitting down on this retaining wall, the Presidential motorcade turned onto Houston Street, and he was able to see President Kennedy and his wife pass approximately 30 yards west on Elm Street from where he was seated. The car passed out of sight and shortly thereafter, he heard one shot, which he first believed to have been a firecracker, and he immediately looked toward the TSBD Building and saw a man in the same window, near the southeast corner of the building, and noticed that this man took deliberate aim and shot the rifle again. When he saw the man shoot the rifle this time, he realized it was the same man that he had seen standing in the

window a few minutes before. After the last shot, he immediately fell off the retaining wall and ran for an officer...Mr. Brennan estimated that it was approximately ninety yards from the window where the shots were fired to the area where the President's car had passed out of sight." (3-24-64 testimony before the Warren Commission, 3H140-161) "after the President had passed my position, I really couldn't say how many feet or how far, a short distance I would say, I heard this crack that I positively would say was a backfire... Well, then something, just right after this explosion, made me think it was a firecracker being thrown from the Texas book store. And I glanced up. And this man I saw previous was aiming for his last shot...it appeared to me he was standing up or leaning against the left window sill, with gun shouldered to his right shoulder, holding the gun with his left hand and taking positive aim and fired his last shot. As I calculate a couple of seconds. He drew the gun back from the window as though he was drawing it back to his side and maybe paused for another second as though to assure himself that he hit his mark and then he disappeared. And at the same moment, I was diving off of approximately that firewall and to the right for bullet protection of this stone wall that is a little higher on the Houston side...I don't know what made me think that there was firecrackers throwed out of the book store unless I did hear the second shot, because I positively thought the first shot was a backfire, and subconsciously I must have heard a second shot but I do not recall it. I could not swear to it."

(Interview with CBS, aired 9-27-64) "I looked directly across and up, possibly at a 45 degree angle. And this man, same man I had saw prior to the President's arrival, was in the window and taking aim for his last shot. After he fired the last or the third shot he didn't seem to be in a great rush, hurry. He seemed to pause for a moment to see if for sure he'd accomplished his purpose. And he brought the gun back to rest in an upright position as though he was satisfied. (About the impact of this shot on Kennedy) "His head just exploded." (His statement to CBS as quoted in his book, Eyewitness to History, published 1987) "There were three shots fired and all of them came from the sixth floor of the Texas School Book Depository Building." (Eyewitness to History, published 1987) "When the presidential car moved just a few feet past where I was sitting, President Kennedy looked back to our side of the street. Just at that moment the whole joy and good will of the day was shattered by the sound of a shot. It took an instant to realize that something had happened. My first instinct was to disbelieve my own ears....My first thought was that it must have been a backfire...I looked up at the Texas School Book Depository. What I saw made my "blood run cold!" Poised in the corner window of the sixth floor was the same young man I had noticed several times before the motorcade arrived. There was one difference—this time he had a rifle in his hands, pointing toward the presidential car. He steadied the rifle against the cornice and while he moved quickly, he didn't seem to be in any kind of a panic. All of this happened in the matter of a second or two. Then came the sickening sound of a second shot and I looked quickly back in the presidential car which had moved only a few feet, still not apparently aware that it was the assassin's target. I saw Governor John Connally reacting to being wounded and the instinctive response of his wife to try and help him. I remember thinking, "Oh my God! He's going to kill them, he's going to kill them all!"...Just then a woman close to me screamed in full realization of what was happening. She uttered something like "Oh my God!" But even as she did my eyes darted back to that solitary figure who was changing history. He was aiming again and I wanted to pray, to beg God to somehow make him miss his target...Then another shot rang out. All of this took only a few seconds...Simultaneous with the third shot, I swung my eyes back to the Presidential car which had moved on down my left on Elm, and I saw a sight that made my whole being sink in despair. A spray of red came from around the President's head. I knew the bullet had struck its intended target...By the time the third shot had been fired, there was sheer pandemonium."

Analysis: Brennan, of course, is most famous for seeing someone who could have been Oswald, and who he later claimed was Oswald, firing the last shot from the sniper's nest. Some, like the Warren Commission and writer Gerald Posner, consider him the most important witness. But one mustn't overlook the problems with Brennan's statements. His recollection of telling CBS that there were three

shots fired from the sniper's nest, when he testified to hearing only two shots, one of which he thought was a backfire, and his seeing only one fired from the nest, is indicative of a desire to please. This should make one wonder about Brennan's refusing to identify Oswald while he was alive, but then fingering the man once he was dead. His oft-repeated claim that he did so out of fear for his life is belied by his talking to a UPI reporter, and describing the shooter, within 24 hours of the assassination, when Oswald was still alive. Brennan's ability to rewrite his memories to fit his desired scenario is demonstrated best in his memoirs. Here he remembers the President and Connally being just a few feet away from him at the time of the shots, not 150, and his hearing three shots, not two, and his seeing two shots fired, not one, and his seeing them hit Connally and Kennedy. Not only did he never mention this last assertion previously but it contradicts his assertion to the FBI that he watched Kennedy disappear from view before the first shot. It's extremely doubtful, furthermore, that he could even have seen the Connallys react to the shots as described, as the Connallys were on the far side of the motorcycle escorts and the Kennedys from him, on a downward slope. Based purely on his early statements, then, Brennan says he heard a shot, turned to the window after something caught his attention, and then saw the sniper take aim for a final shot. Overlooked by all too many is that he looked up because he thought that someone had *thrown* firecrackers from a window, which means he didn't hear a *sound come from* the window itself, but below it. He also said *firecrackers*--plural--indicating he'd heard more than one sound at this point. Most every other witness said the second shot was quite loud. This raises the possibility that Brennan heard an early shot, most likely the shot at around Z-190 heard by most everyone at the corner but dismissed it as a firecracker, and that shortly thereafter he heard the bullet of a silenced weapon whiz past, thus "more than one noise". This second burst could be the bullet or bullets striking Kennedy and Connally at frame 224, the second shot "heard" by Nellie Connally. Brennan then looked up and saw the sniper take aim and fire the last shot from the school book depository, the second shot heard by most others. As he was "diving off approximately that firewall" at this same time it seems possible he could have failed to appreciate a shot or noise coming just after this shot. **Only heard two clear shots. Possible LPM scenario. Possible first shot hit 190.**

Amos Euins sat on the fountain wall to the right of Brennan. There is considerable confusion over Euins' earliest statements, and whether or not he said the shooter was a white man or a black man. Statements regarding his identification of the shooter's race have been highlighted. (11-22-63 report to KRLD and CBS by Jim Underwood, about 30 minutes after the assassination) "As I told you earlier, **a youngster said that he saw a colored man fire three times from the window of that building...** one of the officers found a small colored boy who said he that he saw a man fire from about the fourth floor window of the school book depository building." (Note: this officer was D.V. Harkness, who never confirmed nor denied Underwood's claim Euins said the shooter was black.)(11-22-63 signed statement to the Dallas County Sheriff's Department, 16H963, 19H474) "I saw the President turn the corner in front of me and I waived at him and he waived back. I watched the car on down the street and about the time the car got near the black and white sign I heard a shot. I started looking around and then I looked up in the red brick building. I saw a man in the window with a gun and I saw him shoot twice...I could tell the gun was a rifle and it sounded like an automatic rifle the way he was shooting. **This was a white man**, he did not have on a hat. I just saw this man for a few seconds." (12-14-63 FBI report, CD205 p12) "He said after the President's car started down the hill, he heard what he thought was a car backfire and he looked around and also glanced at the TSBD building, and on the fifth floor where he he had seen what he thought to be a metal rod, he noticed a rifle in the window and saw the second and third shots fired. He stated he saw a man's hand on what appeared to be the trigger housing and he could also see a bald spot on the man's head. He stated he did not see the face of this individual and could not identify him. **He said he was sure this man was white**, because his hand extended outside the window on the rifle. He stated he also heard what he believes was a fourth shot, and that the

individual in the window, after firing the fourth shot, began looking around and he (EUINS) at this time hid behind a concrete partition. He said he saw this individual withdraw his rifle and step back in the window... Euins advised he could not distinguish the features of the man standing at the window, and as he had previously stated, he only saw his hand and a bald spot on his head." (12-23-63 FBI report, CD205 p.i) **"Amos Lee Euins, age 14, states saw white man...in window...with rifle after first shot and observed this man fire second and third shots and what he believes may have been a fourth shot."** (3-10-64 testimony before the Warren Commission, 2H201-210) 'then when the first shot was fired, I started looking around, thinking it was backfire. Everybody else started looking round. Then I looked up at the window, and he shot again... I got behind this little fountain, and then he shot again. (When asked how many shots he heard) "I believe there was four to be exact...After he shot the first two times, I was just standing back here. And then after he shot again, he pulled the gun back in the window. And then all the police ran back over here in the track vicinity... The first shot I was standing here... And as I looked up there, you know, he fired another shot, you know, as I was looking. So I got behind this fountain thing right in there, at this point B... I got behind there. And then I watched, he did fire again. Then he started looking down towards my way, and then he fired again." (When asked what he saw in the building) "I seen a bald spot on this man's head, trying to look out the window. He had a bald spot on his head. I was looking at the bald spot. I could see his hand, you know the rifle laying across in his hand. And I could see his hand sticking out on the trigger part. And after he got through, he just pulled it back in the window." (When asked what kind of a look he got at the shooter) "All I got to see was the man with a spot in his head, because he had his head something like this." (When asked for the record if he means the man was looking down the rifle) "Yes, sir, and I could see the spot on his head." (When asked to describe the man) "I wouldn't know how to describe him, because all I could see was the spot and his hand." (When if he was slender or fat) "I didn't get to see him." (When asked if he could if he was tall or short) "No." **(When asked the man's race) "I couldn't tell, because these boxes were throwing a reflection, shaded."** **(When asked if he could tell if the man was black or white) "No, sir."** (When asked by an incredulous Arlen Specter 'Couldn't even tell that? But you have described that he had a bald--') "Spot in his head. Yes, sir; I could see the bald spot in his head." (When asked if he could tell the color of the man's hair) "No, sir." (When asked if he could tell if his hair was dark or light) "No, sir." (When asked how far back the bald spot stretched) "I would say about right along in here." (Specter then asks: "Indicating about 2 1/2 inches above where you hairline is. Is that about what you are saying? To which Euins responds) "Yes, sir; right along in here." (When asked again if he'd got a good look at the man) "No, sir; I did not." (When asked if he could tell anything about the man's clothes) "No, sir." **(Specter then reads Euins the statement he'd signed in which he claimed the shooter was a white man. He is then asked if the statement refreshes his memory) "No, sir; I told the man that I could see a white spot on his head, but I didn't actually say it was a white man. I said I couldn't tell. But I saw a white spot in his head."** **(When then asked if his best recollection was that he doesn't know if the man was a white man or a negro) "Yes, sir."** **(When then asked if he'd told the police he'd seen a white man, or if they'd made a mistake) "They must have made a mistake, because I told them I could see a white spot on his head."**

(4-1-64 testimony before the Warren Commission of KRLD reporter James Underwood) (Describing the aftermath of the shooting, 6H167-171) "I ran down there and I think I took some pictures of some men--yes, I know I did, going in and out of the building. By that time there was one police officer there and he was a three-wheeled motorcycle officer and a little colored boy whose last name I remember as Eunice." (When asked "Euins?") "It may have been Euins. It was difficult to understand when he said his name. **He was telling the motorcycle officer he had seen a colored man lean out of the window upstairs and he had a rifle.** He was telling this to the officer and the officer took him over and put him in a squad car. By that time, motorcycle officers were arriving, homicide officers were arriving and I

went over and asked this boy if he had seen someone with a rifle and he said "Yes, sir." I said, "Were they white or black?" He said, "It was a colored man." I said, "Are you sure it was a colored man?" He said, "Yes, sir" and I asked him his name and the only thing I could understand was what I thought his name was Eunice." (5-7-64 testimony before the Warren Commission of Secret Service Agent Forrest Sorrels, 7H332-350) (When asked if he'd interviewed Euins in Dealey Plaza a short period after the shots had been fired) "Yes, sir; I did. And he also said that he had heard the noise there, and that he had looked up and saw the man at the window with the rifle, and **I asked him if he could identify the person, and he said, no, he couldn't, he said he couldn't tell whether he was colored or white.**" (11-21-64 AP article found in the Brandon Manitoba Sun) "Amos Lee Euins, 16, schoolboy who went with friends to the end of the motorcade route because he thought they could get a better view than in the crowds downtown. He saw the president fine. And also saw a rifle being withdrawn from the sixth floor of the Depository. Ever since the phone has been ringing at the Euins home. Often it is a man with a heavy voice saying "Amos better be careful with what he says. I have a complete copy of what he told police." "I got a phone call just last week," said Amos' mother, Eva, 40. "Twenty minutes later he called back. It sounded like the same heavy voice. I don't think it's a prank 'cuz no grown man is going to play that much. It makes me uneasy, it really does." The Euins' told police but didn't ask for protection and none was offered. There have been a lot of crank calls to figures in the assassination. Meanwhile at the Euins home a light burns on the front and back porches all night. Amos doesn't usually take the bus to school. Members of the family take him by car. He isn't allowed to roam too far alone. Amos does not appear concerned over the calls." (12-15-64 interview with Dallas Police Officer J. Herbert Sawyer as reported in FBI File 105-82555, sec. 224, p39) "Sawyer continued that only one other person was brought to him who had reportedly seen the assassin. This person was a young negro boy named Euins. However, **upon talking to this youth, it was determined that the boy could not describe the subject, not even to the detail as to whether the man he had seen had been a white man or a negro.**" (1967 interview with CBS, as shown in JFK: The Lost Bullet, 11-20-11) (When asked how many shots he heard from the window) "Well, I heard three."

(1-19-92 interview with Gerald Posner, reported in Case Closed, 1993) "I saw what I thought was a pipe. I saw it ahead of time. It looked like a dark metal pipe hanging from the window, and I figured 'Hey, it's got a pipe hanging off of it.' I never realized it was a gun until the shooting started." (Interview by Max Holland in Dealey Plaza presented in JFK: The Lost Bullet, broadcast 11-20-11) "About the time they got right over there below that sign" (Euins points to a street sign stretching out over Elm, which correlates to Kennedy's approximate position circa Z-160), "then some shots started to ring out, and that's when I got down, behind this." (At this, he ducks down behind the concrete pedestal on the east side of the fountain). The narrator then claims: "Euins has lived most of his life outside the media spotlight, but his story remains the same--that all three shots, including bullet C, came from the sixth floor of the book depository, not from the grassy knoll." Later, the program returns to Euins, claiming "He's one of the few who can recall where the President was when he heard the first shot." It then shows Euins pointing to the limo used in the program at a location a few feet east of where he'd pointed before, at a point correlating to Kennedy's limo's location circa Z-150. It then cuts to a shot taken from behind Euins, showing directly where he is pointing. He is now pointing a few feet further west of where he'd just been pointing. The limo used in the program is no longer there, however, but is back in the location proposed by Holland for the first shot. This is approximately 30 feet east of this position. The program's creators then cut to Max Holland saying "He places it at a specific point in time just as the president passed a black and white sign." They then show Holland asking Euins "What sign was that?" and Euins responding "right there" while pointing to the vertical Highway 80 sign adjacent to the Kennedy stand-in in Holland's proposed location, about 30 feet east of where he'd just been pointing. They then show the limo in position by the Highway 80 sign and Holland asking Euins if "this is approximately the position it was." (Euins responds) "Right. It was just like that (unintelligible)

right there about where it is now when the first shot sounded out. That's where the first shot, it speeded up, and then more shots came out." (He then describes the shots) "There were three altogether. Like pow...pow pow." (The shooting sequence Euins recreates lasts less than 4 seconds.) **Analysis:** Euins' statements fit quite nicely with the second interpretation of Brennan's statements. He hears a shot, the same first shot as Brennan, then looks up at the window, and sees a man in the window with a rifle as the silenced shot which caught Brennan's attention whizzes past. Euins, of course, interprets this as having been fired by the man he sees with a rifle. He then watches this man fire the head shot. The man looks down, and Brennan jumps off the wall. But Euins, who'd already jumped off the wall, hears another shot at this point. Since Euins failed to see the man operate the bolt between these last two shots, and they were very close together, moreover, he goes away thinking the man had fired an automatic rifle. The one problem with this is that Euins' original statement was that he'd heard but three shots. Where did the fourth shot come from? Well, look again--in Euins' original statement he doesn't say he heard three shots, he says "I saw him shoot twice" and that it "sounded like an automatic rifle." In other words, he heard more than one shot one or more of the times he saw the man shoot. As the black and white sign appears to be a reference to the Thornton Freeway sign, moreover, Euins' statements are inconsistent with a first shot miss circa frame 160, or earlier. This is confirmed by his interview in 2011, although the director of JFK: The Lost Bullet, Robert Stone, led people to believe the sign Euins mentioned was the Highway 80 sign. The program, after all, was pushing Max Holland's ridiculous theory the first shot was fired as JFK's limo turned in front of Euins, before Zapruder even started filming. And that's not even the worst of Stone's lies and/or over-sights. The program also claimed Euins' story had remained the same, and that all three shots came from the sniper's nest. Presumably, Stone never even read Euins' Warren Commission testimony, where he specified that he'd heard FOUR shots. It is also of interest that the 1967 CBS footage of Euins used in JFK: The Lost Bullet appears to have come from the same interview of Euins broadcast by CBS on 6-25-67, in which he discussed seeing the rifle sticking out from the sniper's nest. So why did CBS cut Euins' claim of hearing three shots--which completely undermined his then widely-quoted testimony he'd heard four shots--from their program? Your guess is as good as mine. **Heard four shots. First shot 190. Last two shots bunched together. Last shot after the head shot and quite possibly not even fired from the sniper's nest.**

Toni Glover was an 11-year old girl in 1963, and claims to have been one of the two girls watching the assassination from the pedestal along the east side of the fountain on 11-22-63. (She can be seen in the Martin film, [here](#). She is the one in blue, with the other girl in front of her.) In 2012, she announced that she was writing a book. Although her full story is yet to be revealed, here are some online posts which reflect her conclusions. (Description of Glover's interviews with the Sixth Floor Museum, as found on the museum's website) "Standing on a concrete pedestal at the corner of Houston and Elm Streets in Dealey Plaza, eleven-year-old Toni Glover witnessed the Kennedy assassination. Seeing the president's death, connected emotionally to her abusive childhood, had a traumatic impact on her life. Recorded **January 20, 1999**, and **March 14, 2012**." (Email to Gerda Dunkel from Sixth Floor Museum curator Gary Mack, regarding the young girl's identity, posted on the JFK Assassination Forum, **2-2-12**) "Her name was Toni Glover, she was 11 years old and she did not know who the other girl was. Toni did an oral history for The Sixth Floor Museum in 1999, though a transcript has not yet been made. She thought two shots were fired and she's recently returned to the Museum's Reading Room to do research for some project." (**4-15-12** post on youtube, in response to comments on a video by Gerda Dunkel, in which the identity of the girl in blue was discussed) "This is Toni Glover. And, yes, I was standing on top of a cement block at the end of the stone wall. I've been back recently and taped 2 Oral Histories for The Sixth Floor Museum." (**4-16-12** post on youtube, in response to Dunkel's questions about what Glover remembered) "I'm afraid I'm not much help with conspiracy theories. I think a nutcase had a fight with his wife that morning. Then he carried out a delusional thought process and got lucky with

his shots. I heard 2 clear shots, maybe 3. The thing is, sounds downtown bounce off the buildings making it almost impossible to identify shots and direction." (4-16-12 post on alt.assassination.JFK newsgroup, in which Glover announced her upcoming book.) "I've been writing a memoir about watching Kennedy's head explode, and I came across this site. For what it's worth, I was standing on top of a cement block at the corner of Houston and Elm. Eleven year old girl in a blue ski jacket. Robert Hughes, Mark Bell and Frances Dornan films all catch glimpses. And as hard as it is for folks to believe it, one little jerk fired from the window and got off a couple of lucky shots. An idiot killed Kennedy. One idiot who had a huge fight with his wife that morning. I had a panoramic view, and there was no conspiracy. Terrible sadness, but no conspiracy." (4-19-12 post on alt.assassination.JFK newsgroup, in which she responded to some of the researchers expressing skepticism) "Oh Lordy. I have stepped into it. I knew nothing about this site. It was late and I searched my name and Kennedy. When John's work showed up I was stunned and wrote a stupid email. Let's start over. My name is Toni (Antoinette) Glover. I was born in Dallas, Texas at Methodist Hospital on February, 14, 1952. (That's right, Valentine's Day) I lived in Oak Cliff, about 5 minutes from downtown. I was eleven. After a lot of begging, my mom took me to the parade. We went straight to Dealey Plaza thinking the end of the parade would have the least people. I don't remember anyone else there when we arrived. An excited 11 year old, I kept running back and forth from my "perch" to Main Street looking down it to see if I could tell the cars were coming. I did this several times. On one of those trips to Main, a guy had a seizure at Main and Houston. I was afraid they would divert the parade because of the ambulance. I went back to my cement block before they turned onto Houston. When the limo passed he looked up, waved and smiled. Then he turned the corner and a couple of seconds later, his head exploded. There is a column that blocked my view for a couple of seconds, but then the car reappeared and bang. From my perspective, the plume of brains and blood sparkled a little in the Texas sun. I told my mom someone threw sparklers in the car!!!! I have no other evidence of any kind about the assassination. Announcing that Oswald was, "an idiot" and other remarkable statements I made were at best ill-informed. I am not an historian. I will stick to telling my experience and let you historians figure out who did what. My personal belief is that Oswald acted alone. But that's just my opinion. I didn't see anything like odd individuals, or flashes or anything else that would make me think otherwise. Loud noises echo in downtown Dallas. I "think" I heard 2 shots, but I have always qualified that by saying "everything echoes down there". I'm not sure how anyone can tell where the shots came from. But many feel otherwise. I'm happy to answer questions about my life and experience, but drawing conclusions is above my pay grade. I know I was standing on the cement block the entire time Kennedy was on Houston and Elm. I have no idea who's view I blocked. And I'm not sure who is on the block with me. I doubt my mom would have crawled up that high."

(4-21-12 post on alt.assassination.JFK newsgroup in response to a series of questions from Don Roberdeau) (When asked if she was on the pedestal for all the shots) "Yes. I was up on the pedestal from the moment the limo turned onto Houston, to the second it went under the Triple Underpass. So I was up there for the shots." (When asked if she followed the limo the whole way) "There is a column in the Plaza that blocked my view for a second. I think the first shot was when my view was blocked. I'll send the video and you can see exactly when I could see what." (When asked how many shots she recalled hearing) "I have no idea how many shots were fired (I think I heard 2), but anyone serious about this needs to go down there and listen to how much it echoes in the canyons of downtown Dallas. I have always qualified my answer by saying it echoed so much, I couldn't tell how many shots (at least 2) or where any of them came from. After the first shot, I looked at my mom, but other than that, my eyes were glued on the car. It was an extraordinarily emotional time for me. I don't know how many people have seen a human head explode, but I was eleven and it traumatized me. So remembering details is mixed with a LOT of emotion. I do my best." (When asked if she smelled gunpowder) "Didn't smell anything (certain on that one)." (When asked if she noticed the behavior of the motorcycles and

cars in the motorcade other than the limousine) "I saw there were cars following, but again, my gaze was transfixed on the president's car. You can see in one of the photos I'm waving my arms at the president as he turned the corner onto Elm. I didn't pay any attention to the other cars." (When asked what happened after the shots) "In the aftermath people were stunned at first, then it became chaotic. I had yelled "someone threw fireworks in the car" and I remember people looking up at me cause they couldn't see anything and I could. But that lasted only second, because I immediately tried to get down and people had started moving down Elm...As soon as I got down, I looked around for sources that might know what's really happening, and saw a police motorcycle (maybe 2?) parked in front of the SBD steps. I ran over there to listen to what the police were being told. I tried not to act like I was listening. I was there for maybe 30 seconds (I don't know exactly) when I heard the words "shot in the head." I immediately ran back to my mom. She had a heart condition and we were always trying to protect her from stress, so I lied and said, "It only grazed his head, let's go home." We walked the block to our car and drove straight down Elm like any other day. It wasn't blocked off. It amazes me that they let cars drive through the scene 5 minutes after the assassination. Now that we have all the crime solving TV, it seems odd that a crime scene was not blocked off. SO, in a nutshell: I was on the pedestal until the car vanished, I got off and ran across the street to listen to the police radios, I went back to my mom (still near the pedestal) and told her his head was grazed and that we should leave right away. I was acutely aware of her heart condition and wanted to get her out of there ASAP. SO I was in the Plaza 2-3 minutes after the final shot? Timing this is very difficult for me. It could have been 1 minute, but not more than 5. I'm guessing it took 2-3 minutes for me to go hear the radios, get back to my mom and leave. I know it was fast." (When asked her mom's recollections and if the other person on the pedestal could be her mother) "Mom died in 1996. In fact it was her death that made me start thinking I needed to contact someone at the Museum. The thing she talked about most was the guy who wouldn't let us down. Geez it's hard for me to remember what she wore. I know I tried to get her up on the pedestal, but it was high. At one point when we were waiting, we both sat on the stone fence. But that was long before anything happened. I want to say that's mom next to me, but I can't be sure. Logically, it would have been odd for her to lose all dignity and climb up there. But it looks like her coat in Dorman. The woman could definitely be my mom. It looks like I hug her as the limo turns onto Elm. The top of the pedestal is slanted, very slightly from the edge to the center. That made it a little tricky not to fall off. I was probably trying to steady whoever is up there. That's the best I can do unless I find a family picture of her in that coat. I'll tell my sisters to go through some family albums." (When asked if she'd brought along any friends) "No friends there. Only me and mom." (Final comments) "I wish I had an exact schematic drawing of my end of the reflecting pool to the corner curb. I could point out exactly where I was and when. Trying to explain it with words doesn't produce a clear picture. Did I answer all the questions. Parts are clear and some parts are fuzzy. I can only do my best. That's how memory works, well mine does. Clear pieces/fuzzy pieces. Sometimes a picture clears up a fuzzy memory. I thought trees blocked my view for that second I couldn't see the car, but when I went back in March, I climbed up on the pedestal and discovered it was the column, not a tree, that blocked my view. Things like that show you how memory tries to fill in the blanks." **Analysis:** Glover's belief the column blocked her view of Kennedy at the time of the first shot suggests he was further down Elm Street at this time than he would have been circa frame 160. Researcher Don Roberdeau has added her onto his plat of Dealey Plaza and compared her position to that of the column at northwest end of the fountain, and concluded from this that the column would have blocked her view of Kennedy from Zapruder frame 180 to Zapruder frames 217-218. You can view his plat [here](#). **Only Heard Two Shots. First shot 190-224.**

Robert Edwards (11-22-63 statement to the Dallas County Sheriff's Department, 19H 473, 19H647) "The motorcade rounded the corner at this time, and then I thought I heard four shots, but it never occurred to us what it was. The shots seemed to come from that building there." **(12-2-63** FBI report,

CD205 p.21-22) “Shortly after President Kennedy’s car passed his position, he heard shots, which he thought were three or four in very rapid sequence.” (4-1-64 testimony before the Warren Commission, 6H200-205) (when asked how many shots he heard) “I heard one more than was fired, I believe... I still right now don’t know how many was fired. If I said four, then I thought I heard four. (when asked if he knew where the shots came from) “I have no idea” (when asked if he’d said the shots came from the building) “No, I didn’t say that.” **Analysis:** Edwards, to his credit, stuck to his impression that he’d heard four shots that seemed to come from the school book depository. **Heard four shots.**

Ronald Fischer (11-22-63 statement to the Dallas County Sheriff’s Department, 19H475, 19H650) “by that time the motorcade rounded the corner. And then I heard what I thought was three shots, and the motorcade was about where the Stemmons Freeway sign is there.” (12-2-63 FBI report, CD205 p.19-20) “Shortly after the President’s car had passed his position, he heard several shots, evenly spaced, with what he thought three or four seconds between each shot. He thought first shot was firecracker.” (4-1-64 testimony before the Warren Commission, 6H191-200) “Well the motorcade—the limousine made the wide turn and —they went out of our view just as they began to straighten up onto Elm Street...as I looked around to watch these other cars, I heard a shot. At first I thought it was a firecracker. And—uh— everybody got quiet. There was no yelling or shouting or anything. Everything seemed to get real still. And—uh—the second shot rang out, and then everybody, from where I was standing, everybody started to scatter. And—uh—then the third shot. At first I thought there were four, but as I think about it more, there must have been just three... The—uh--first shot fooled me, I think, because of the sound bouncing off the buildings. But the second shot was too much like the first and it was too loud—both shots were too loud to be a firecracker... They appeared to be coming from just west of the School Book Depository.... there were some railroad cars back in there.” (9-23-64 interview with William Manchester, as presented in the Death of a President, 1967) (On seeing someone in the sniper's nest before the shooting) "Suddenly, Edwards pointed and said 'Look at that guy.' Fisher followed his finger. The weapon was below their line of sight; what had attracted Edwards' attention was Oswald's stance. Fischer agreed that it was peculiar. He was transfixed, staring to his right, away from Main. To Fischer it seemed that 'he never moved, he didn't even blink his eyes, he was just gazing, like a statue.'" (On the first shot) "Ronald Fischer and Bob Edwards, assuming that it was a backfire, chuckled." (7-9-98 video-taped interview posted on Youtube) "I originally said in my deposition in the Sheriff's office that there were four shots. And there were a number of people who had claimed that they heard four shots. However, I began to question that because I just simply could not remember exactly how many shots there were. It's like trying to remember if it was eight or nine--y'know it's a little easier with three or four--but becomes more difficult with eight or nine and still more difficult with nineteen or twenty. I don't know if there were three or four shots. I thought there was four and I had explained that to the investigator, Mr. Belin. I still think that there were probably four shots but I couldn't swear to it." **Analysis:** Fischer’s statement that he heard the shots evenly spaced feeds into the LPM scenario, but his placement of the motorcade by the Stemmons Freeway sign suggests a different scenario. His testimony that at first he thought he’d heard four shots, when taken with his latter statements, indicates that he most probably did hear what he took to be four shots.

Probable first shot 190-224. Probably heard four shots.

John Martin (4-2-64 FBI report, CD897 p.51-53) “Martin said he ran north on Houston Street and stopped at the north end of the reflection pool which lies west of and is adjacent to Houston Street... Martin said he took some movie shots of the President as he passed by on Elm Street. A few seconds after the President had passed and was departing from his view, he heard a loud report and at first thought that it was a firecracker and a few seconds later heard two more reports and then knew it was rifle fire...the shots sounded to him like they came from the Texas School Book Depository.” (2-27-79 interview by Dave Hawkins, as quoted in Pictures of the Pain, p.571) “the shot came over my head, and I looked around to see who was throwing a firecracker. Then a few seconds later there were two more

shots...One shot then a space of time, then two more rapidly.” **Analysis:** by separating the first shot off by itself, Martin is indicating the first shot must have hit. **First shot hit 190 -224. Last two shots bunched together.**

The next set of witnesses were on the south east corner of Houston and Elm.

James Crawford (1-10-64 FBI report, CD329 p.22) “Mr. Crawford estimated that approximately four or five vehicles, including the Presidential vehicle, had turned down Elm when Mr. Crawford heard sounds which at first were believed by Crawford to be the backfiring of an automobile. Mr. Crawford believed these sounds came from one of the cars in the front of the Presidential motorcade which was approaching the Triple Underpass... Mr. Crawford stated that to his best recollection there was a definite pause of as much as 15 to 20 seconds between the first and second sounds, and the second and third sounds came very close together.” (4-1-64 testimony before the Warren Commission, 6H171-174) “I believe there was a car leading the President’s car, followed by the President’s car, and followed, I suppose, by the Vice President’s car, and in turn by the Secret Service in a yellow closed sedan. The doors of the sedan were open. It was after the Secret Service sedan had gone around the corner that I heard the first report and at that time I thought it was a backfire of a car...The second shot followed some seconds, a little time elapsed after the first one, and followed very quickly by a third one.”

Analysis: as the Vice-Presidential back-up car was completing its turn at Z-190, Crawford is not talking Z-160. **First shot hit 190. Last two shots bunched together.**

Mary Mitchell (1-18-64 FBI report, CD329 p.24) “as the Presidential car passed the curb in front of the Texas School Book Depository, (TSBD), she and her companion heard a loud report or explosion, then, after four or five seconds, there were two more rapid explosions. She said that she and her companion could not see the Presidential car at that time but the crowd became highly excited.” (4-1-64 testimony before the Warren Commission, 6H175-177) “I was on the corner of Elm and record—I’m sorry, Elm and Houston... diagonally across the intersection from the Texas school Book Depository... Well, the President’s car passed and, of course, I watched it as long as I could see it... after the car turned the corner and started down the hill, I couldn’t see over the heads of the standing men for very long, so then I turned back to watch the other people in the caravan, whatever you call it, and probably about the time the car in which Senator Yarborough was riding had just passed, I heard some reports. The first one—there were three—the second and third being closer together than the first and second.” **Analysis:** while Mitchell cites the car with Yarborough as the last one through the intersection, she would not have known anyone in the back-up car to whom she could make reference. Even if she honestly believed the car with Yarborough was the last car through the intersection before the shots began, however, her description of the last shots being bunched and of the Presidential limo being out of sight at the time of the first shot should make one doubt there was a first shot miss at frame 160. **First shot hit 190-224. Last two shots bunched together.**

TE Moore (1-10-64 FBI report, 24H534) “He was standing at the southeast corner of Elm and Houston and observed the motorcade going by, turning west from Houston onto Elm Street. By the time President Kennedy had reached the Thornton Freeway sign, a shot was fired and Mr. Moore observed the President slump forward in the Presidential car. Mr. Moore heard two more shots fired; however, the President was out of Mr. Moore’s sight when the last two shots were fired.” (No More Silence, p.90-93, published 1998) “There was a highway marker sign in front of the Book Depository, and as the President got around to that, the first shot was fired. As he got down a little further, the second shot was fired, and then I believe as it got further down, a third shot was fired... You couldn’t tell exactly where the shots were coming from, though.” **Analysis:** Mr. Moore moved the first shot up from the Thornton Freeway sign to the highway marker in front of the TSBD. Or maybe his choice of words was just unfortunate. Maybe, to him, the Thornton Freeway sign was a highway marker in front of the TSBD. **Probable first shot 190.**

Mrs. Carolyn Walther (12-5-63 FBI report, 24H522) (She was standing) “on the east side of Houston Street, about fifty or sixty feet south of the south curb of Elm Street...As soon as the President’s car passed where she was standing, she and Mrs. Springer turned away and started walking north toward Elm Street. At about the time they reached the curb at Elm Street, she heard a loud report and thought it was fireworks. There was a pause after this first report, then a second and third report almost at the same time, and then a pause followed by one and possibly more reports.” (**Late 1966** interview with Lawrence Schiller recounted in *The Scavengers and Critics of the Warren Report*, published 1967) "I heard one shot, and I thought at the time the first shot was a firecracker, and after the last car passed me I started walking back to work, and I had reached the curb, and two more shots, and then a second--two seconds later, one more. It wasn't as loud as the others. But the second and third shots were right together, and then I thought 'Oh, it's gunshots'.....I definitely feel that I heard four shots." (Interview with CBS broadcast **6-25-67**) “The President passed us, and he was smiling, and everybody was waving. Then the last of the cars went by, and I heard the shot. I thought it was a firecracker. Then I started back to work, and it was along the curb, and then two shots right together, and then another one. I'm sure there were four shots.” (**3-27-68** interview with Barry Ernest recounted in *The Girl on the Stairs*, published 2011) "Mrs. Walther said she 'heard four shots. And right after the last shot I saw this police officer drop his motorcycle and immediately run into the Depository.' Marrion Baker. She described the sounds as having a definite pause between the first and second shots, then the second and third shots sounded like they were fired 'at the same time.' After that there was another slight pause, and then she heard a fourth shot. (**2-14-69** testimony in the trial of Clay Shaw) (When asked how many shots she heard) “All together I heard four” (When asked what the first one sounded like) “It was a loud popping sound and I thought it was just a firecracker...the last car was passing in front of me when I heard the first shot...The second one I was just stepping off the curb. “ (And the third?) “Almost to the center of the street.” (And fourth?) “In the center of the street.” (And how did they sound? The second?) “It sounded just like the first one.” (The third?) “The same” (And fourth?) “A little lower...I stopped and said "That is gunshots." **Analysis:** while most hearing two shots together were referring to the second and third shots of a three shot scenario, Mrs. Walther heard numbers two and three together in a four shot scenario. It’s possible she heard a first shot around frame 190, automatic weapon fire around frame 224, and then a final shot around the time of the head shot. Another possibility is she simply mistook an echo after the head shot for a separate shot. **Heard four shots.**

Mrs. Pearl Springer (12-5-63 FBI report, 24H523) (She and Mrs. Carolyn Walther) “walked south on Houston Street on the east side of Houston Street, stopping just south of a sign post. (This sign post is seventeen steps south of the Elm Street curb.)...After the presidential party passed her and turned the corner going west on Elm Street, she heard what she thought was a shot...She recalled that after the first shot, there was a pause, then two more shots were fired close together.” **Analysis:** as Springer’s recollections confirm the recollections of so many others, her contention that it was shots number two and three of a three shot scenario that were bunched together casts doubt on the accuracy of the statements of her companion, Mrs. Walther. First shot hit 190-224. Last two shots bunched together.

There were also three traffic policeman in the intersection...

Edgar Smith (7-17-64 statement to the Dallas Police Department, CD1259, p16) “I heard the three shots but was unable to determine the location they came from.” (**7-24-64** testimony before the Warren Commission, 7H565-569) “I heard three shots. I guess they were shots. I thought that the first two were just firecrackers and kept my position and after the third one, I ran down the street there.” (When asked if he thought the shots came from a concrete structure on the knoll) “Yes, sir.” (No More Silence, p.197-203, published **1998**) “It seemed like a short time, maybe ten or fifteen seconds after they had made the turn, that the first shot rang out...I thought it was probably firecrackers...Then the next two

occurred. It seemed like a lot of time elapsed between the three shots. I couldn't really tell where the shots came from, but they sounded like they all came from the same direction. Certainly it didn't seem to me that they came from the sixth floor...At the time of the shooting, I was looking more toward the grassy knoll...I looked down there and was able to see the Presidential car lurch off...I reacted by running across the street from the south side of Elm toward the underpass." **Analysis:** by saying that the shots could have rang out as much as fifteen seconds after the car made the turn onto Elm, Smith implies there was no shot at frame 160. Similarly, by saying "the next two occurred" Smith is implying the last two shots were bunched together. **Probable first shot hit 190-224. Last two shots probably bunched together.**

Joe Marshall Smith (12-9-63 FBI report, as summarized in CD205 p39) "was working on November 22, 1963, on traffic at Elm and Houston streets. He stated he was near the parking lot when the shots were fired which killed President Kennedy. The shots echoed so loudly he had no idea at the time where they had been fired from. He stated he did smell what he thought was gunpowder but stated this smell was in the parking lot by the TSBD Building and not by the underpass. He advised he never at any time went to the underpass and could not advise if there was the smell of gunpowder in the underpass. He stated he did not see the President when he was shot and stated he saw nothing which would assist in this matter." (12-13-63 article in the Texas Observer, as reported in Six Seconds in Dallas, 1967) "Patrolman Smith had earlier told Ronnie Dugger of the The Texas Observer that he had 'caught the smell of gunpowder' behind the fence. 'I could tell it was in the air.'" (7-16-64 Statement to the Dallas Police Department, 22H600) "I was standing in the middle of Elm Street from the southeast curb of Elm and Houston Streets at the time of the shooting. I heard the shots and thought they were coming from bushes of the overpass." (7-23-64 testimony before the Warren Commission, 7H531-539) "Then I heard the shots...I started up toward the Book Depository after I heard the shots, and I didn't know where the shots came from. I had no idea, because it was such a ricochet...and this woman came up to me and she was just in hysterics. She told me, "They are shooting the President from the bushes." So I immediately proceeded up here...I was checking all the bushes and I checked all the cars in the parking lot...maybe it was a power of suggestion. But it sounded to me like they may have come from this vicinity here." **Analysis:** by the time his statements were taken, Smith knew that officially all the shots had come from the sniper's nest. He therefore had to explain why he rushed down towards the knoll immediately after the shots. That the other Officer Smith did the same thing is indicative that the shots did sound like they came from west of the sniper's nest. **Too vague. Smelled smoke near knoll.**

Welcome Eugene Barnett (11-25-63 interview with William Turner, recounted in Turner's book Rearview Mirror, published 2001) "As the President's motorcade swung past him, he heard a sharp report, like a firecracker. After about three seconds there was another shot. Dealey Plaza reverberated with the sounds. He looked over his shoulder to the roof of the depository but saw nothing. The Secret Service men in a car behind the President's limousine were looking around, unable to fix where the shots were coming from. In what seemed like another three seconds after the second shot, a third sounded. (7-16-64 statement to the Dallas Police Department, 22H598) "When the shots were fired, I looked up and could not see anyone or anything extending out of the windows. I thought the shots were coming from top of the building." (7-23-64 testimony before the Warren Commission, 7H539-544) "I didn't hear any echo. The whole sound echoed. The sound lingered, but as far as just two definite distinct sounds, when each shot was fired that one sound would linger in the air, but there would be nothing else until the next shot...I was looking at the President when the first shot was fired, and I thought I saw him slump down, but I am not sure, and I didn't look any more then. I thought he was ducking down....I thought it was a firecracker. But none of the people moved or took any action...And when the second shot was fired it sounded high...I looked up at the building and I saw nothing in the windows...because I was standing too close...And I looked back again at the crowd, and the third shot was fired." **Analysis:** as Kennedy does not duck down between Z-160 and Z-190, the movement

Barnett saw after the first shot could only be a reaction after Z-190. **Probable first shot hit 190-224.**

On the northeast corner of Houston and Elm there were many witnesses, but only a few have been interviewed.

Mrs. Ruby Henderson (12-6-63 FBI report, 24H524) "She was standing on the east side of Elm Street just north of Houston Street (they must mean the east side of Houston just north of Elm)...at the time the motorcade passed where she was standing, she heard what she initially thought was a firecracker, and saw what she thought was paper fly out of the Presidential car. She said she now realized it was a shot she heard and what she thought was paper was probably flesh. She said after the first shot, she believes she heard two more in rapid succession, and then a fourth shot." **Analysis:** as Henderson says paper flew out of the car, and not that confetti or fragments exploded in the car, the probability is she did indeed see paper and not flesh. Perhaps she saw the streamer flying along the ground reported by SS agent Warren Taylor. For Henderson to think there were three shots fired after the head shot, when she was standing just across from the sniper's nest, would make little sense indeed. Still, that Henderson recalls the two bunched shots in the middle, as Walther, who was only a short distance away, should make one suspect that maybe there was something to make them think this way. Were there two quick shots fired at frame 224 but unheard by most everyone else? Or was there a shot fired after the bangbang of the head shot, even as the limousine was speeding away? **Heard four shots.**

Mike Brownlow is a long-time assassination researcher and a regular presence in Dealey Plaza. He claims also to have been a witness. In **November 2004, and again in 2005**, I talked with him in Dealey Plaza and asked him where he was when the shots rang out. Both times he told me he was standing in front of the Dal-Tex Building on the northeast corner of Houston and Elm with his grandmother. Both times he said he heard four shots, but could not tell where they came from. (**12-6-11** article by Jay Gibbs on researcher Bruce Engelman, found on the Starlocalnews.com website) "Engelman, who has worked for several national news organizations, including ABC, has a national sports talk show that he records every Tuesday night. Last Tuesday, however, he had a special guest in his recording studio -- Mike Brownlow of Dallas. Brownlow was a 13-year-old kid who was near the Grassy Knoll in Dallas when JFK was shot. "I heard one shot and then, immediately after that, I heard a second shot," Brownlow said. "Then, after that, I heard several shots in succession -- POP! POP! POP! Then, in a matter of five or six seconds, it was all over. The shooting had stopped. And I definitely think that the last shot I heard came from the Grassy Knoll." **Analysis:** As a number of other witnesses near this intersection also heard four shots, I initially believed Brownlow's story to be credible. In 2010, however, the nephew of a Dallas Police Officer Brownlow claims to have known contacted me and assured me that Brownlow had never actually known his uncle, and is lying when he claims he did. The report on Brownlow's radio appearance is also problematic. It suggests that Brownlow is now claiming there may have been five shots, and that the last one came from the knoll. In Brownlow's defense, however, it should be pointed out that he said he thinks the last shot came from the knoll. This is not the same as claiming he'd initially thought it came from the knoll. **Heard four shots. Last shots bunched together.**

Chapter 8: Final Pieces

a look at the witnesses in front of and inside the Texas School Book Depository

Down in Front

Here we finally take a look at the statements of those standing directly in front of the Texas School Book Depository Building, many of them Oswald's co-workers. While reading these statements, one should keep in mind the words of Harvard Psychophysics Professor David Green, after studying the way shots were heard in Dealey Plaza for the HSCA. He said ""there are certain locations that are best for observing certain shots and in the general region of the book depository, right on the street beneath it, in our opinion it was extremely easy to tell it came from the book. There was a massive sound to the right and rear that sort of crawled down the building, presumably due to scatter on the regular surface of the building and it was quite evident."

Danny Arce (11-22-63 FBI report, CD205 p7) "The President's automobile had passed and was a short way down Elm Street towards the underpass when I heard something like a gunshot and then a second and third shot close together." **(3-18-64** statement to the FBI, 22H634) "when president John F. Kennedy was shot, I was standing on the grassy area directly in front of the Depository Building approximately thirty feet from the President's car. However I could not see the car when the shots rang out. To the best of my knowledge there were three shots and they came from the direction of the railroad tracks." **(4-7-64** testimony before the Warren Commission, 6H365-367) "I seen him when he turned the corner and when he went down that underpass thing and I heard them shots and I couldn't see anything...I was directly in front, but then I walked a few steps down to the west side...there's a little sidewalk right across the street and there's some grass and things up there and that's where I was at...I guess you could say I was in front of the building but not directly in front of it." **Analysis:** Arce's words indicate that Kennedy had just passed his position, and that the last two shots were close together. **First shot hit 190-224. Last two shots bunched together.**

Joyce Stansbury (3-24-64 statement to the FBI, 22H674) "On November 22, 1963, I recall I left the Depository building at approximately 12:15 PM and took up a position on the curbside on the north side of Elm Street leading into the triple viaduct about thirty feet west of the corner...I don't recall having ever observed Lee Harvey Oswald in the Texas School Book Depository." **Analysis:** another statement in which the witness said as little as possible. **Too vague.**

Mrs. Donald Baker (Virgie Rackley)(11-25-63 FBI report, CD5 p.66-67) "She was standing across the street immediately in front of the building...She observed President Kennedy's car pass...and almost immediately thereafter heard three explosions spaced at intervals which she at first thought were firecrackers. It sounded as though these sounds were coming from the direction of the Triple Underpass and looking in that direction after the first shot she saw something bounce from the roadway in front of the Presidential automobile and now presumes it was a bullet bouncing off the pavement." **(3-19-64** statement to the FBI, 22H635) "I recall that moments after the Presidential car passed I heard three loud reports, which I first thought to be a prankster throwing firecrackers." **(7-22-64** testimony before the Warren Commission, 7H507-515) "well, after he passed us, then we heard a noise and I thought it was firecrackers, because I saw a shot or something hit the pavement...I thought there were some boys standing down there where he was—where the President's car was...close to the underpass." (When asked if she could see the Stemmons Freeway Sign) "No, I couldn't see the sign because it was angled—we were stepping out into the street then and it was approximately along in here, I presume, the first sign." (When asked if it was near the first sign) "As I can remember, it was...I thought it was a firecracker. It looked just like you could see the sparks from it and I just thought it was a firecracker and I was thinking that somebody was fixing to get in a lot of trouble and we thought the kids or whoever threw it were down below or standing near the underpass or back up here by the sign" (When asked if it would have been near the underpass or the sign) "It was near the signs" (When asked how close to the opposite curb it was) "It was approximately in the middle of the lane" (When asked where it hit compared to the car) "I thought it was—well—behind it." (When asked how many shots she heard) "three" (When asked where she believed they came from) "it sounded like it was coming from

—there was a railroad track...so I guess it would be by the underpass.” **Analysis:** Mrs. Baker is another one of those witnesses that LPM theorists and conspiracy theorists alike love to use to demonstrate that there was a first shot miss. A close look at her statements should lead one to question this, however. In the FBI report she merely mentioned seeing something hit the street in *front* of the limousine. When re-questioned in March, and given a statement to sign, she doesn’t mention a bullet striking the street, only hearing firecrackers. It isn’t until July—eight months after the shooting, that she begins to state she saw sparks or something hit the street *behind* the limousine. Since she thought the people throwing the firecrackers were in front of the limo, moreover, it’s possible she didn’t mean behind the limousine on the street, but behind the limousine from her perspective, i.e., in front of the limousine, as she’d previously told the FBI. In any event, even if she saw a first shot miss, and a bullet strike the street behind the limousine, her statements do not support the LPM scenario. She placed the limo down near the first sign—the Thornton Freeway sign--when the first shot rang out. This is past Kennedy’s location at frame 160. She also said the bullet or whatever struck the middle of the lane beside the car, behind the car, and that she thought the shots were coming from the underpass. This would indicate that the sparks or whatever she saw exploded along the asphalt in the opposite direction of a shot coming from the sniper’s nest, right in front of Officers Martin and Hargis. Well, why didn’t they or anyone else nearby see this? Not coincidentally, Mrs. Baker was asked during her testimony to put a mark on a photo of Dealey Plaza to indicate where she saw these "sparks" hit the street. This is exhibit 354. Not surprisingly, her mark is a good 70 feet or so further down the road than Kennedy at frame 160. This undoubtedly suggests she did not see the first shot miss proposed by far too many. **First shot hit 190-224.**

Carolyn Arnold (11-26-63 FBI report, CD5 p41) "As she was standing in front of the building, she stated she thought she caught a fleeting glimpse of Lee Harvey Oswald standing in the hall way between the front door and the double doors leading to the warehouse, located on the first floor. She could not be sure that this was Oswald, but felt it was and believed the time to be a few minutes before 12:15 P.M. She stated thereafter she viewed the presidential motorcade and heard the shots that were fired at the President; however, she could furnish no information of value as to the individual firing the shots or any other information concerning Oswald, whom she stated she did not know and had merely seen him working in the building." **(3-18-64 statement to the FBI, 22H635)** “at the time President Kennedy was shot, I was standing in front of the Texas School Book Depository...I left the Texas School Book Depository at about 12:25 P.M. November 22, 1963, and never returned to this building on that date.” **(3-31-64 radiogram from FBI HQ to Dallas FBI, FBIHQ file 62-109060, sec 55 p42)** "Re Bureau airtel, March sixteen, last and your airtels March twenty-five and twenty-eight, last relating for commission's request for signed statements from individuals known to have been in Texas School Book Depository on November twenty-two, nineteen sixty-three. Before statements can be disseminated to the commission, following corrections necessary: statement of Mrs R.E. "Carolyn" Arnold, paragraph six, line two, time indicated as 12:25 A.M. should be "P.M." If this is typo bureau will handle." **(November, 1978 interview with Anthony Summers published in Conspiracy, 1980--part of this quote may have come from an 11-26-78 article published in the Dallas Morning News)** "About a quarter of an hour before the assassination...about 12:15, it may have been later... I went into the lunchroom on the second floor for a moment...Oswald was sitting in one of the booth seats on the right-hand side of the room as you go in. He was alone as usual and appeared to be having lunch. I did not speak to him but I recognized him clearly." **Analysis:** As Mrs. Arnold claimed to have seen Oswald on the lower floors of the depository building at a time when he was supposedly upstairs, her words are quite controversial. So why wasn't she called to testify before the Warren Commission? Just as important...since the 1978 interview in which she claimed the FBI misrepresented her 1963 statements was published during the HSCA's lifetime (The 3-31 FBI radiogram confirms that her 3-18 statement was changed by the FBI before it was forwarded to the commission), why didn't they talk to her? **Too**

vague.

Betty Dragoo (3-18-64 statement to the FBI, 22H645) “I walked just across the street in front of the building entrance. I was standing at this point when President John F. Kennedy was shot.” (She names Richey, Arnold, Baker, and Johnson as standing nearby.) **Analysis: too vague.**

Judy Johnson (3-23-64 statement to the FBI, 22H656) “I was with Miss Jeannie Holt...and Miss Stella Jacob... We walked to the southwest corner of Elm and Houston Streets...I was standing at this point on the sidewalk near the edge of Elm Street at the time President John F Kennedy was shot. I heard three explosions which sounded to me like firecrackers...I do not know Oswald and do not recall ever having seen him.” **Analysis:** another employee working in the school book depository who didn’t know Oswald from Adam. **Too vague.**

Bonnie Richey (3-18-64 statement to the FBI) “At the time President Kennedy was shot I was standing in the roadway directly south of the Texas School Book Depository.” **Analysis: too vague.**

Patricia Lawrence (11-24-63 FBI Report, 22H841): “When the motorcade passed she stated she was looking at Mrs. Kennedy who was looking to the other side of the car. The President was looking in her direction and she had waved. She heard the shot fired as the president was waving. Thereafter she heard two additional shots; shots which seemed to have come from right over her head.” (2-17-64 report of the Dallas Police Department, CD950 p.48) "Subject also stated that she was standing on the front row of persons on Elm Street at the time of the assassination." (2-17-64 report of the Dallas Police Department, CD950 p.57) "Subject heard the three shots that were fired but could not tell where they came from." (3-20-64 statement to FBI, 22H660) “I recall that when the car in which the president was riding passed my position I was looking at Mrs. Kennedy who was looking to the other side of the car. President Kennedy was looking in my direction and I waved. A few seconds following this I heard a shot and following this shot two more shots.” **Analysis:** as Lawrence reports that Kennedy was waving at the time of the first shot, she is probably talking about a shot circa Z-190, after Kennedy had resumed waving, as opposed to a shot at frame 160, before he'd resumed waving. Her grouping the last two shots together is at the same time indicative of what is now clearly the dominant scenario. **First shot hit 190-224. Last two shots probably bunched together.**

Lupe Whitaker (3-19-64 statement to the FBI, 22H681) (was with Patricia Lawrence) “At the time President Kennedy was shot, I was standing on Elm Street directly south of the main entrance of the Texas School Book Depository.” **Analysis: too vague.**

Ochus Campbell (11-24-63 FBI report, 22H845) “he and several other associates were together stationed about 30 feet in front of this building facing away from the building observing the passing motorcade containing President Kennedy. At this time, he heard a loud report, which at first he considered to be a firecracker or some such object set off by a crank and believed the noise came away from his building...After hearing two more such reports, he realized that they must have been rifle shots and since President Kennedy’s car had advanced just out of his vision, he went forward a few feet to observe this automobile, inasmuch as he feared that the rifle shots were in connection with an attempt upon President Kennedy’s life. He then observed the car bearing President Kennedy to slow down, a near stop, and a motorcycle policeman rushed up. Immediately, following this, he observed the car rush away from the scene.” (11-26-63 FBI report, CD5 p336) "Mr. Campbell advised he had viewed the Presidential Motorcade and subsequently heard the shots being fired from a point which he thought was near the railroad tracks located over the viaduct on Elm Street." (2-17-64 statement to the Dallas Police Department, box 3 folder 19 file 4 of the Dallas JFK Archive) "We then walked across Elm Street and stood on the curb near the parade as it turned from Houston Street down under the underpass. I heard the shots, it sounded like they came from the knoll near the railroad tracks. I thought it was fire crackers." (3-19-64 statement to the FBI, 22H638) “Mr. Truly and I decided to view the

motorcade and took up a position next to the curb on Elm Street adjacent to the street signal light...I recall that shortly after the car in which the President was riding passed the Texas School Book Depository I heard shots being fired from a point which I thought was near the railroad tracks located over the viaduct on Elm Street...I have had occasion to view photographs of Lee Harvey Oswald and to the best of my recollection never saw him while he was employed at the Texas School Book Depository.” **Analysis:** as Campbell was the VP of the TSBD, his statement that he’d never seen Oswald, despite Oswald’s having worked there for six weeks, is revealing. There were just too many companies in the building, with too many employees, for people to notice whether or not the people in the building actually belonged there. His statement that the car had already passed the Depository when the shots rang out is an argument against a shot at frame 160, where the limousine was directly in front of the building. His initial grouping of the last two shots together is also informative. **First shot 190.**

Roy Truly (11-23-63 statement to the Dallas Sheriff’s Department, 24H227) “After the President passed, we heard what sounded like an explosion. I heard three such explosions. Then I realized they must have been shots.” (11-23-63 FBI report, CD5 p322) “Shortly after 12:30 PM, as the President’s procession did pass in front of the building, he heard what he believes to be three shots. He was unable to place exactly the source of these shots but believed they came from the area of the railroad yards adjoining the depository building.” (11-23-63 FBI report, CD5 p324) “He saw the President go by and at about that time heard three explosions.” (12-2-63 FBI report on an investigation performed 11-25-63, CD385, p.7) “Mr. ROY S. TRULY, Warehouse Manager, TSBD, was exhibited an Associated Press photograph described as “DN 5, 11/22/63, Dallas, Texas,” depicting an individual standing in the entrance of the TSBD who resembled Lee Harvey Oswald. Mr. Truly, after viewing this photograph, stated, “That picture resembles Oswald, but it’s not Lee Oswald, it’s Billy Lovelady.” (12-4-63 sworn statement to the U.S. Secret Service, CD87 p793) “I heard three shots fired and moments later a man who I believed to be a motor cycle policeman came running up to the entrance of the building, and I accompanied him inside.” (12-7-63 Secret Service report based on interviews conducted between 12-2 and 12-5, CD87 p778) “Mr. Roy S. Truly...has been interviewed on several occasion between November 26 and December 4, 1963...the President’s automobile passed his location at about 12:30 P.M., and a moment later three shots rang out.” (3-19-64 statement to the FBI, 22H677) “At the time President John F. Kennedy was shot I was standing with Mr. Campbell in the street just in front of the building entrance. I heard three shots fired...” (3-24-64 testimony before the Warren Commission, 3H212-241) (When asked where he was standing when the shots were fired) “I would judge out in Elm Street, 10 to 15 or 20 feet from the front steps. We first stood on the steps, the bottom steps a few minutes, and then we walked out in the line of spectators on the side of Elm Street.” (He was told to mark an “I” on Exhibit 361 showing his location. But the only identifiable mark on this exhibit as published by the Warren Commission appears to be on the north side of the Elm Street extension directly in front of the building, 20-30 feet west of the steps, not where Campbell claimed they’d been standing.) (When describing the turn of the limo onto Elm Street) “the driver of the presidential car swung out too far to the right, and he came almost within an inch of running into this little abutment here, between Elm and the Parkway. And he slowed down perceptibly and pulled back to the left to get over into the middle lane of the parkway. Not being familiar with the street, he came too far out this way when he made his turn.” (When asked the speed of the limousine) “he picked up speed along here, and then seemed to have fallen back into line, and I would say 10 or 12 miles an hour in this area.” (When asked what happened next) “I heard an explosion, which I thought was a toy cannon or a loud firecracker from west of the building. Nothing happened after the first explosion. Everything was frozen. And immediately after two more explosions, which I realized that I thought was a gun, a rifle of some kind. The President’s—I saw the President’s car swerve to the left and stop somewhere down in this area. It is misleading here. And that is the last I saw of his car, because this crowd, when the third shot rang out--there was a large crowd all along this abutment here, this little wall, and there was some

around us in front--they began screaming and falling to the ground. And the people in front of myself and Mr. Campbell surged back, either in terror or panic. They must have seen this thing. I became separated from Mr. Campbell. They just practically bore me back to the first step on the entrance of our building." (When asked how long the limo stopped) "It would be hard to say over a second or two or something like that. I didn't see, I just saw it stop. I don't know. I didn't see it start up." (9-26-64 interview with William Manchester, as represented in *The Death of a President*, 1967) (On the uncomfortable fact so many Secret Service agents failed to recognize the first shot as a shot) "It was comprehensible that Roy Truly should dismiss the first shot as a cherry bomb..." (3-21-68 interview with Barry Ernest recounted in *The Girl on the Stairs*, published 2011) "He had been standing outside when the motorcade passed. Truly 'distinctly heard three shots,' he said, and then accompanied a 'running' police officer, Marrion Baker, into the depository." (11-09-83 AP article found in the *Indiana Gazette*) "Twenty years later, he refuses to talk about what he saw on Nov. 22, 1963. 'That's something that was in the past and you don't talk about,' Truly said politely. 'Everybody who was there has lived through it and that's all I want to say.' **Analysis:** as Truly groups the last two shots as two more explosions, he probably heard them bunched together. While he said that people fell to the ground after the third shot, there was almost certainly a slight delay before the panic reached his location. **Probable first shot 190. Last two shots probably bunched together.**

Mrs. Robert A. Reid (11-22-63 Affidavit to Dallas County, 24H223) "I was standing on the front steps of the building, as the parade drew near I walked closer to the street...Just after the President passed by I heard three shots. The first thing I thought of was someone was shooting at the President." (11-26-63 FBI report, CD5 p.27) "She had observed the Presidential motorcade proceed down Elm Street from a position in front of the Texas School Book Depository, and had heard three shots which she later determined came from the above building...The only thing she noted was that the three shots had come from above somewhere." (12-4-63 sworn statement to the U.S. Secret Service, CD87 p798) "As the motorcade drove by I heard what sounded like three shots. I thought at the time that the shots had come from the School Book Depository Building." (12-7-63 Secret Service Report based on interviews conducted between 12-2 and 12-5, CD87 p785) "Mrs. Reid was standing on the street in front of the building and she heard three shots fired. She thought the shots had come from within the building." (3-18-64 statement to the FBI, CD706, p. 78) "When President John F. Kennedy was shot, I was standing in front of the Texas School Book Depository Building with Mr. O.V. Campbell and Mr. Roy Truly." (3-25-64 testimony before the Warren Commission, 3H270-281) (When asked if she was standing directly in front of the main entrance to the depository building at the time of the shots) "That is correct." (When describing the shots) "I was naturally watching for the car as the President came by. I looked at him and I was very anxious to see Mrs. Kennedy. I looked at her and I was going to see how she was dressed and she was dressed very attractive and she put up her hand to her hat and was holding it on, the wind was blowing a little bit and then went on right on by me and that is the last as far as the parade, I mean as far as they were concerned. I did see Johnson, and that was it. I can't even tell you any more about the parade because after the shots I didn't know any part about that...I heard three shots...And I turned to Mr. Campbell and I said, 'Oh, my goodness, I am afraid those came from our building,' because it seemed like they came just so directly over my head, and then I looked up in the windows, and saw three colored boys up there, I only recognized one because I didn't know the rest of them so well...James Jarman." **Analysis:** Mrs. Reid's statements are consistent with the LPM scenario as well as many others. If one is to interpret her original Affidavit's "just after" as implying "within a second or two," her statements are more consistent with a shot at frame 160 than at 190. Still, her testimony, in which she acknowledges seeing Vice-President Johnson when the shots were fired, suggests the opposite. At frame 160, we should recall, Johnson was still in the intersection. On the other hand, she could have been looking forward into the motorcade when looking at Johnson, only to turn away at the first shot. As she walked back into the school book depository building just after the

shots and went back to work, moreover, and told Lee Harvey Oswald that "someone has shot the president," it seems highly unlikely she'd thought the shots had come from the building all along, as purported in her statements to the Secret Service and Warren Commission. **Possible LPM scenario. Possible first shot 190.**

James Worrell (11-23-63 affidavit to Dallas County, 16H959) "I was standing on the sidewalk against a building on the corner of Elm and Houston Streets watching the motorcade of the President. I heard a loud noise like a fire cracker or gun shots. I looked around to see where the noise came from. I looked up and saw the barrel of a rifle sticking out of a window... While I was looking at the gun it was fired again. I looked back at Mr. Kennedy and he was slumping over. I got scared and ran from that location. While I was running I heard the gun fire two more times. I ran from Elm Street to Pacific Street on Houston. When I was about 100 yards from the building I stopped to get my breath and looked back at the building. I saw a w/m, 5'8" to 5'10", dark hair, average weight for height, dark shirt or jacket open down front, no hat, didn't have anything in his hands, come out of the building and run in the opposite direction." (3-6-64 UPI article on Worrell in the Dallas Times-Herald) "He said he was standing directly below the sixth floor of the depository when he heard a shot. 'I looked up real quick and saw the barrel fire again. I looked to see where it hit and saw President Kennedy hit in the back of the head. Then I looked up again and saw it fire a third time. I was 'moving out' by then and didn't see where it hit,' he said. The youth, currently unemployed and no longer enrolled at Thomas Jefferson High School, also claims he heard a fourth shot as he ran around the corner. 'I heard four shots, I don't care what they say,' he said." (3-10-64 testimony before the Warren Commission, 2H190-201) "as they went by me, they got, oh at least another 50, 75 feet on past me, and then I heard the shots... I looked up and saw the rifle... I looked to see where he was aiming and after the second shot and I have seen the President slumping down in the seat... I looked up again and turned around and started running and saw it fire a third time... I did it all in one motion, I looked up, turned around, and ran, pivoted... everybody was screaming and saying "duck"... Just as I got to the corner I heard the fourth shot... they were right in succession... I turned the corner, went right down beside the building on the sidewalk and when I got to the corner... Of this building (The Texas School Book Depository) (I) "Cut directly across, kind of at an angle... I rested there... approximately three minutes before I saw this man come out the back door." (When asked to estimate the time span of the shots) "best estimate 5, 6 seconds" (When asked how he knew the rifle fired the second shot) "I saw what you might call a little flame and smoke." (When asked about the third shot) "Same thing, a little flash of fire, and then smoke." **Analysis:** while the Warren Commission used Worrell to establish that the shots were fired from the sniper's nest, they ignored that he said there were four shots. His statement that the last two shots occurred while he was running a short distance is indicative they were fired close together in time. His statement that the shots were fired in succession is perhaps indicative of the extreme stress he was under as he ran from the building—people routinely over-estimate the duration of stressful activity by 50% or more. If this was a factor, then the last two shots might have seemed in cadence with the first two. Or perhaps Worrell simply encountered a previously un-noticed echo as he ran out into the street. Still, as he heard screaming after the third shot, and there was little, if any, screaming reported prior to the head shot, his recollection of another shot after the screaming began is consistent with the words of many of the closest witnesses. The extra shot heard by Worrell would then be an extra shot heard in the beginning or the middle of the shooting scenario. As he says Kennedy slumped after the second shot, and Kennedy slumped forward after frame 224 of the Zapruder film, this part of his story is consistent with both the LPM scenario and a scenario whereby Kennedy was hit at Z-190 and again at Z- 224. While he says he saw the second shot fired, perhaps he, as Euins, saw the rifle and heard the sound and incorrectly connected the two. Perhaps, by the time he testified, had come to remember seeing the smoke he saw with the third shot, with the second shot as well. Or perhaps he really did see smoke both times. **Heard four shots. Two early shots. Last two shots probably bunched together (with the last shot after the head shot).**

Clotile Williams (7-24 64 FBI report, CD1395, p.6) “she took up a position on the northwest corner of Houston and Elm Streets...shortly after President Kennedy’s car passed this position she heard some shots. She said she does not recall the number of shots fired...she did not see anything that aroused her suspicion and did not know where the shots came from.” **Analysis: too vague.**

Mrs. H.G. Whitaker worked on the third floor of the depository building. (2-18-64 report of the Dallas Police Department, box 3 folder 19 file 19 of the Dallas JFK Archive) (She) "got back to the steps of the building on the Elm Street side. This was the Texas School Book Depository Building. This was about 12:30 PM. She saw the motorcade pass and then heard two shots...She did not recall ever having seen Oswald...She stated the shots sounded like they came from the west of the building but they did sound as if they came from above." **Analysis: only heard two shots.**

Madie Reese (11-24-63 FBI report, CD5 p.59) “Mrs. Reese...heard three shots or what seemed...to be shots. At first she thought the shots came from the alcove near the benches.” (2-17-64 report of the Dallas Police Department, CD950 p.47) "The subject stated that on the day of the assassination she was on the steps in front of the Texas School Book Depository Building, waving at the motorcade as it passed the building. She stated that she heard three reports, distinct and separate and knew that they were reports of gunfire." (3-20-64 statement to the FBI, 22H669) “I...took up a position on the second step from the bottom (in front) of the main entrance of the Depository Building...Mrs. Dean was standing directly to my left at the time of the assassination...and we both heard the three shots...I do not recall having ever consciously seen Lee Harvey Oswald in the Texas School Book Depository Building.” **Analysis:** once again, someone who’d worked in the same building with Oswald for six weeks but who’d never noticed him. **Too vague.**

Mrs. Joseph Eddie Dean aka Ruth Dean (11-25-63 FBI report 22H839) “President Kennedy had just looked in their direction and waved when she heard a rifle shot. Shortly thereafter she heard another rifle shot and then a third. During these moments, she observed President Kennedy slump down into the car. After the first or second shot, she observed President Kennedy reach to the back of his neck just before he slumped down.” (2-18-64 report of the Dallas Police Department, CD950 p.53) "Subject stated she was standing on the front steps of the building when President J. F. Kennedy was assassinated." (2-18-64 report of the Dallas Police Department, CD950 p.55) "Subject further stated that she heard the three shots fired by the assassin. Subject stated that she thought the first shot was a firecracker exploding. After the second shot, subject stated that she knew it was gun shots. Subject further stated that after the third shot, she knew they came from above, but she did not see anyone." (3-19-64 statement to the FBI, 22H643) “I was standing on the front steps of the Texas School Book Depository...As the motorcade passed by I heard three shots and observed the President slump over in the automobile in which he was riding.” (No More Silence, p.70-72, published 1998) “The view where we were was very good. But the motorcade went a little bit beyond us before the shooting started. I heard three shots with two being close together and one a little further apart...I remember seeing Jacqueline Kennedy climb over the back and on to the turtle back of the car, and the Secret service man jumped up and made her get back in the car.” **Analysis:** her statement that two shots were closer together is a little vague. Which two? Similarly, as Kennedy looks in her direction and waves in the middle of the Towner film, 5 seconds or so before frame 160 or 190, her statements that he had just looked in their direction can’t be taken literally. **Too vague.**

Mrs. Avery Davis (12-10-63 FBI report, CD7 p.23) “she was standing on the front steps of the building when the president passed and she then heard three explosions. She did not realize they were shots.” (2-18-64 report of the Dallas Police Department, box 3, folder 19, file 6 of Dallas JFK Archive) "She saw the motorcade pass her location. From her location she heard the three shots but thought they came from the railroad to the west." (3-20-64 statement to the FBI, 22H642) “A moment after the car in which President John F. Kennedy was riding passed, I heard three explosions. At first I did not realize

these explosions were gun shots...I did not know...but thought they were from the direction of the viaduct which crosses Elm Street.” **Analysis: too vague.**

Judy McCully (11-24-63 FBI report, CD5 p. 432) "On November 22, 1963, McCully was watching the Presidential Procession from the fourth floor of the Texas School Book Depository Building and just after the Presidential Car had passed the building, she heard a noise, which she thought to be a shooting. She did not know from which direction the shot was fired. At that time, she did not observe any suspicious activity on the part of anyone in the Texas School Book Depository Building, or among the persons in front of this building. McCully stated she is not acquainted with Lee Harvey Oswald and does not recall ever having seen him in the Texas School Book Depository Building." **(2-18-64** report of the Dallas Police Department, box 3 folder 19 file 13 of the Dallas JFK Archive) "Miss McCully stated that on November 22, 1963, she and Mrs. Avery Davis were standing on the front steps of the Texas School Book Depository at 12:30 PM, and were watching the Presidential parade. She saw the President's car go by, and as the car proceeded down toward the triple underpass, she heard three shots. The shots sounded like they came from the right side of the building in the arcade." **(3-20-64** statement to the FBI, 22H663) "I was standing on the front steps of the Texas School Book Depository Building with Mrs. Charles Davis, also an employee of Scott-Foresman, to watch the motorcade bearing President John F. Kennedy pass by the building. As the motorcade passed, I heard some shots fired, but did not know the direction from which they came." **Analysis:** while there's a discrepancy in the statements of Ms. McCully regarding her location at the time of the shooting, it seems possible this mistake was the fault of her FBI interviewer, and that he'd mistakenly assumed she'd watched the motorcade from her office--on the fourth floor. That she had a screw loose or was afraid of telling the truth to the FBI, however, also seems possible, seeing as she was twice quoted by them as saying she couldn't tell where the shots had come from, but told the DPD she thought the shots had come from west of the building. **Too vague.**

Carl Jones (3-18-64 statement to the FBI, 22H657) "When President John F. Kennedy was shot I was sitting on the front steps of the Texas School Book Depository. With me were Mr. Roy Truly, Mr. O.V. Campbell, Mrs. R.A. Reid, and Billy Lovelady...I heard three shots just after President Kennedy passed by in his car and I saw him slump in his seat." **Analysis: too vague.**

Buell Wesley Frazier (11-22-63 affidavit for Dallas County, 24H209) "I was standing on the front steps of the building when the parade came by, and I watched the parade go by. After President Kennedy had got out of my sight, I heard three shots. I stood there, then people started running by, and I turned, and went back in the building." **(12-5-63** sworn statement to the U.S. Secret Service, CD87 p796) "I was standing on the front steps when the parade passed in front of the building. When the shooting occurred, I did not realize the shots were really shots until the second one. At first I thought it was backfire. I did not realize the shots had come from this building but thought they had come from somewhere around the triple underpass or railroad tracks." **(3-11-64** testimony before the Warren Commission, 2H210-245) (On his location during the shooting) "I was standing on the steps there and watched for the parade to come by and so I did and I stood there until he come by." (On who was with him at this time) "I stayed around there pretty close to Mr. Shelley and this boy Billy Lovelady and just standing there, people talking and just talking about how pretty a day it turned out to be, because I told you earlier it was an old cloudy and misty day and then it didn't look like it was going to be a pretty day at all." (Anybody else?) "There was a lady there, a heavy-set lady who worked upstairs there whose name is Sarah something, I don't know her last name." (On the shooting) "just right after he went by he hadn't hardly got by, I heard a sound and if you have ever been around motorcycles you know how they backfire, and so I thought one of them motorcycles backfired...but it wasn't just a few seconds that, you know, I heard two more of the same type of, you know, sounds, and by that time people was running everywhere, and falling down and screaming, and naturally then I knew something was

wrong...to be frank with you I thought it come from down there, where that underpass is.” (3-18-64 statement to the FBI, 22H647) “At the time President Kennedy was shot I was standing on the front steps of the Texas School Book Depository. I was with William H. Shelley...and Billy Lovelady.” (2-13-69 testimony in the trial of Clay Shaw) “Just right after they made the turn there was several motorcycle policeman leading the motorcade and right after they turned, after the car made the turn, it sounded like the motorcycles were backfiring...Shortly after there were two more in rapid succession.” (When asked if he knew they were rifle shots) “Well, the two that come in fast succession by that time, like I said, people were hollering, and then I recognized them, they were rifle shots.” (When asked the time lapse between the first and second shots) “It was just a few seconds.” (When asked the time lapse between the second and third) “When I heard the second noise, the third was followed nearly just right back to back. It was fired in rapid succession.” (He was then asked to demonstrate the spacing of the shots by clapping his hands, but the spacing of his hand claps was not noted on the transcripts of the trial) (11-21-77 interview with HSCA investigators Moriarty and Day, edited down from a transcript provided by Richard Gilbride) “everybody was following the presidential motorcade...then I heard a loud sound--motorcycle backfire...from where I was standing, there was some trees and some people--so I actually couldn't see. But what had actually happened was the first shot...and then I heard the same sound. It wasn't anywheres even close to me...It was then that I realized--as people were beginning to run--and it became quite still. Before I had the chance to be heard, a sound--like a motorcycle backfire--what sounded like a backfire erupt.” (When asked if the shots sounded the same) “the noises that I heard was all similar...they matched or they were from the 6th story...they seemed to be all pretty the same...Like I say, the first one that was fired, and then it seemed like it was only another few seconds and then they's coming up with another...they was in tandem. They was in the same area, the same direction. You know, like the same sound.”

(7-23-86 testimony in televised mock trial, On Trial: Lee Harvey Oswald) (When asked how many shots he heard) “Three.” (When asked if he thought the shots came from the railroad) “Yes, sir, from the knoll there.” (When asked again about the direction of the shots) “I thought they came from the knoll here.” (He is then asked to write the words “grassy knoll” on a map of Dealey Plaza and put an X where he thought the shots had come from. He writes the words on the map to the west of the arcade, and then puts an X by these words at the northernmost point of the picket fence, in the railroad yards to the west of the arcade.) (6-21-2002 oral history with the Sixth Floor Museum) “I was standing at the top of the steps, the entrance, to the Texas School Book Depository. I was standing in the shadows...When they turned from Houston Street onto Elm there, and started down to the underpasses there, I remember I remarked to myself, I said, ‘well, they look just like they do in the pictures’... (When asked how long it was after the limo had completed its turn onto Elm Street and started heading away that he heard the first shot) “It wasn't very long before there was a shot. And, as I said earlier, from listening to the motorcycles that was leading the President's car that had been backfiring, at first I thought it was a backfire from a motorcycle...” (When asked if the shot sounded like backfires) “Yes. But then shortly after, there was two more. By that time there was really chaos. There was people running and everything and you knew something wasn't right...I couldn't actually see what was going on in the President's car...After they had passed and dropped out of sight, I couldn't see what was going on.” (When asked when he first realized Kennedy had been shot) “By the time the second and third shot was fired, I realized it wasn't a motorcycle backfire, because it had a different sound to it. And I realized someone was firing, and people was, as I said in that whole area there was running and falling down...” (When asked from where he thought the shots were fired) “The sound to me at that time sounded like it was coming from up above...the only thing I can say is that I realized it was gunfire, but to be specific as to what building it was coming from other than saying it was coming from up above where we were standing, I can't be more specific than that...” (When asked how many shots) “I heard three shots. There was one, and then there was, the other two was much closer in succession.” (When asked the length of

the shooting) "I don't know exact, but probably, I would probably say all, and this is probably, I don't know for a fact, I would probably say all three shots was taken within 15 seconds...There was the first one, and then the second and third one was just almost just back to back. It was very fast." (When asked the time between the last two shots) "I would probably say, maybe five seconds, if it was that long." (When asked if there could have been more or fewer than three shots) "Not fewer than three...I heard three." (When asked where the car was when the first shot was fired) "It wasn't very far after it dropped out of my sight...I couldn't see the car...The car was out of my view when the first shot was fired...(When attempting to clarify his approximation of 15 seconds for the shooting) "If you take and fire a shot say like for instance on the first second, and then the second shot might not have been somewhere until like the 8th to 10th seconds, and then the third one I would say somewhere between the 10th and 15th." **Analysis:** while Frazier, Oswald's car-pool buddy, placed the limousine close enough to the corner to suggest the LPM scenario in his testimony at the Shaw trial, he originally specified that the car was much further down the street and out of his sight. His grouping of the last two shots together supports this earlier statement. **First shot hit 190-224. Last two shots bunched together.**

William Lovelady stood on the front steps of the depository building and is easily identified in James Altgens' photo of the assassination, with the President's limo in the foreground and the front steps of the depository in the background. Due to Lovelady's resemblance to Oswald, however, some have tried to claim it is not Lovelady on the steps but Oswald--a claim refuted by everyone standing in the area. (11-22-63 sworn affidavit, 24H214) "When the President came by, Bill Shelley and I was standing on the steps in front of the building where I work. After he had passed and was about 50 yards past us I heard three shots. There was a slight pause after the first shot then the next two was right close together. I could not tell where the shots came from but sounded like they were across the street from us. However, that could have been caused by the echo." (11-22-63 FBI report, CD5 p332-333) "On November 22, 1963, Lovelady and his foreman, Bill Shelley, were standing on the front doorstep at 411 Elm Street at about 12:30 P.M. watching the Presidential motorcade pass. At about this time he heard three shots. At first he thought it was a firecracker or the backfire of a motorcycle." (12-2-63 FBI report on an investigation performed 11-25-63, CD385, p.8) "Mr. Billy Nolan Lovelady, 7722 Hume, Dallas, Texas, was exhibited an Associated Press photograph described as "DN 5, 11/22/63, Dallas, Texas," depicting an individual standing in the entrance of the TSBD who resembled Lee Harvey Oswald. Mr. Lovelady advised that he is an employee at the TSBD and is acquainted with Oswald. Lovelady immediately identified himself in the above-described photograph as being the individual who resembled OSWALD and stated he had observed himself previously in this photograph in the newspaper and was saving it. Lovelady stated there was no question whatsoever but that this was a photograph of him." (3-2-64 FBI report on an investigation performed 2-29-64) "Billy Nolan Lovelady appeared at the Dallas FBI office at which time he consented to be photographed. Lovelady advised that on the day of the assassination of President John F. Kennedy, November 22, 1963, at the time of the assassination and shortly before, he was standing in the doorway of the front entrance of the Texas School Book Depository...He stated he was wearing a red and white vertical striped shirt and blue jeans...Lovelady stated his picture has appeared in several publications which picture depict him on the far left side of the front doorway to the TSBD. Lovelady was exhibited a picture appearing on pages 4-5 of the magazine entitled Four Dark Days in History...He immediately identified the picture of the individual on the far left side of the doorway of the TSBD as being his photograph...Mr. Lovelady stated his close resemblance to Lee Harvey Oswald has become somewhat embarrassing." (3-19-64 statement to the FBI, 22H662) "At the time the presidential motorcade passed the Depository building heading west on Elm Street I was standing on the top step to the far right of the wall to the entrance way to the Texas School Book Depository Building. At this time I recall that William H. Shelley...and Mrs. Sarah Stanton...both of whom are likewise employed at the Texas School Book Depository, were

standing next to me. I recall that following the passing of the Presidential motorcade, as the car in which the President was riding traveled down the Elm Street extension, I heard several loud reports which I first thought to be firecrackers, and which appeared to me to be in the direction of the Elm Street viaduct just ahead of the motorcade. I did not at any time believe the shots had come from the Texas School Book Depository Building. I am acquainted with Lee Harvey Oswald as a fellow employee only and I recall that on the morning of November 22, 1963, I was on the sixth floor of the Texas School Book Depository putting down a new wooden floor when Oswald came over to me and asked where a certain book was stored. I don't recall name of the book but told him that book was out of stock. That is the last time I saw Oswald prior to the assassination of President John F. Kennedy...I recall that following the shooting, I ran toward the spot where President Kennedy's car had stopped. William Shelley and myself stayed in that area for approximately five minutes when we then re-entered the Depository building by the side door located on the west side of the building." (4-7-64 testimony before the Warren Commission, 6H336-341) (When asked who was with him on the front steps when the shots were fired) "Bill Shelley and Sarah Stanton and right behind me..." (When asked what he heard) "I thought it was firecrackers or somebody celebrating the arrival of the President. It didn't occur to me at first what had happened until this Gloria came running up to us and told us the President had been shot." (When asked from where he thought the shots had been fired) "Right there around that concrete little deal on that knoll...to my right. I was standing as you are going down the steps, I was standing on the right, sounded like it was in that area...Between the underpass and the building right on that knoll." (When shown Exhibit 369--a photo by James Altgens of the shooting with President Kennedy's limo in the foreground, and Lovelady on the front steps of the book depository in the background, and asked to mark the picture and identify himself.) "Right there at the entrance of the building standing on the top of the step, would be here (indicating)...It would be your top level." (When asked what Gloria Calvery told him) "She had been right close to it to see and she had saw the blood and knew he had been hit." (When asked what he and Shelley did after talking to Calvery) "We went as far as the first tracks and everybody was hollering and crying...and we said we better get back into the building, so we went back into the west entrance on the back dock had that low ramp and went into the back dock back inside the building." (5-23-64 UPI article found in the 5-24-64 New York Times) "Billy Lovelady, an employee of the Texas Schoolbook Depository, identified himself today as the man seen in a doorway in a photo taken moments after President Kennedy was shot. 'I recall standing in the doorway and I have about 20 witnesses who were there near me,' he said. 'They will verify it was me.' Many newspapers in Europe published in weekend editions an American photograph taken a split second after Mr. Kennedy was shot last Nov. 22. The picture purported to show a man who looked like Lee H. Oswald, the accused assassin, standing in the doorway of the depository building. Newspaper descriptions said the man 'bears an extraordinary resemblance' to Oswald, who was shot two days later by Jack L. Ruby. Authorities said that minutes after the shooting Oswald was seen in a second-floor lunch-room of the building. The shots were fired from the sixth floor. The newspapers asked, 'If the man in the doorway was Oswald, who, then, fired the bullets which killed the President?' Mr. Lovelady, a stock clerk, said he had given testimony about the photo to agents of the Warren Commission investigating the assassination. He said he had also cooperated with the Federal Bureau of Investigation. He said that investigators for both the F.B.I. and the Warren Commission were satisfied it was he and not Oswald in the doorway. Mr. Lovelady said the F.B.I. had taken pictures of him from various angles and that he had been shown a three-by-four foot blowup of the doorway picture and asked if he was in it. 'I immediately pointed to myself in the doorway,' Mr. Lovelady said. He said he was about 15 to 20 pounds heavier than Oswald and about three inches shorter. Asked whether there was any resemblance to Oswald, he replied, 'I'm fatter in the face.' 'It was me in the doorway,' he said. 'If anyone doesn't believe it, they will just have to take my word.' Dallas authorities said the photograph had been examined carefully after the assassination." (5-24-64 article by Dom Bonafede in the New York Herald-Tribune) (While discussing the person in the Altgens photo some claim is

Oswald) "Lovelady maintains it is he standing in the doorway at the moment of the assassination. 'I was standing on the first step,' he told me when I interviewed him in Dallas two weeks ago. 'Several people saw me. That lady shielding her eyes works here on the second floor.' (While discussing the shots) "He said that while watching the motorcade from the doorway of the Book Depository he distinctly heard three shots--'there was one, then a pause, then two fast ones.'" **Analysis:** Lovelady's and Shelley's testimony that they returned to the building through a western entrance, an entrance unknown to Warren Commission counsel Joseph Ball, is one of the more surprising moments of the testimony. As there was no mention of this entrance being sealed off by the Dallas Police Department in the immediate aftermath of the shooting, it's possible someone could have escaped through this door for some time after the shooting. Otherwise, Lovelady's description of the shots, and of where the limousine was at the time of the shots, supports the scenario described by the bulk of the witnesses.

First shot hit 190-224. Last two shots bunched together.

William Shelley (11-22-63 statement to the Dallas Sheriff's Department, 24H226) "The President's car was about halfway from Houston Street to the Triple Underpass when I heard what sounded like three shots. I couldn't tell where they came from. I ran across the street to the corner of the park and ran into a girl crying and she said the President had been shot. The girl's name is Gloria Calvery... I went back to the building and went inside and called my wife and told her what had happened. I was on the first floor then and I stayed at the elevator and was told not to let anyone out of the elevator. **(3-18-64** statement to the FBI, 22H673) "as the Presidential motorcade passed I was standing just outside the glass doors of the entrance. At the time President Kennedy was shot, I was standing at this same place. Billy N. Lovelady who works under my supervision at the Texas School Book Depository was seated on the entrance steps just in front of me. I recall that Wesley Frazier, Mrs. Sarah Stanton, and Mrs. Carolyn Arnold, all employees of the Texas School Book Depository, were also standing in this entrance way near me at the time Pres. Kennedy was shot. I did not see Lee Harvey Oswald at the time Pres. Kennedy was shot. I did not observe any strangers in the building at any time during the morning of November 22, 1963. Immediately following the shooting, Billy N. Lovelady and I accompanied some uniformed police officers to the railroad yards just west of the building and returned through the west side door of the building about ten minutes later. I remained in the building until about 1:30 PM when I was asked to go to the Dallas Police Dept. to furnish an affidavit. I returned to the Texas School Book Depository about 5 PM. I did not leave the building until about 7 PM that day." **(4-7-64** testimony before the Warren Commission, 6H327-334) (When asked with whom he had lunch out on the front steps) "Well, there was Lloyd Viles of McGraw-Hill, Sarah Stanton, she's with Texas School Book, and Wesley Frazier and Billy Lovelady joined us shortly afterwards." (When asked where they were standing) "Just outside the glass doors there." (When asked what he heard) "I heard something sounded like it was a firecracker and a slight pause and then two more a little bit closer together... Sounded like a miniature cannon or baby giant firecracker, wasn't real loud... Sounded like it came from the west... officers started running down to the lumber yards and Billy and I walked down that way. We walked on down to the first railroad track there on the dead-end street and stood there and watched them searching cars down there in the parking lots for a little while and then we came in through our parking lot at the west end... in the side door into the shipping room... I saw Eddie Piper... He was coming back from where he was watching the motorcade in the southwest corner of the shipping room." **Analysis:** Shelley places the limousine too far down Elm at the time of the first shots to be a reference to frame 160. He also heard the second two shots closer together. **First shot hit 190-224. Last two shots bunched together.**

Sarah Stanton (11-23-63 FBI report, CD7 p.20) "Sarah Stanton...advised that she is employed in the second floor office of the Texas School Book Depository...and at about 12:30 on November 22, 1963, she was standing on the front steps as the President passed and shortly thereafter she heard three explosions; however, she did not know where they came from and immediately went into the building,

caught the elevator, and went to the second floor offices, and into the office of the Southwestern Publishing Company, located there, to try to look out the window and see what was happening. She then went to the restroom and later returned to her desk.” (3-18-64 statement to the FBI, 22H675) “when President John F. Kennedy was shot, I was standing on the front steps of the Texas School Book Depository with Mr. William Shelley...Mr. Otis Williams...Mrs. T.B. Saunders...and Billy Lovelady. I heard three shots after the President’s car passed the front of the building but I could not see the President’s car at that time. I cannot say positively where the shots came from. I did not see Lee Harvey Oswald at that time or at any time during that day.” **Analysis:** while Stanton's statements help debunk the surprisingly resilient claim it was Oswald, and not Lovelady, in the Altgens photo, her description of the shooting itself is of little help. It is intriguing, nonetheless, that the purportedly well-spaced shots purportedly coming from directly above Ms. Stanton...were not recognized as such. **Too vague.**

Pauline Saunders (11-24-63 FBI report, 22H844) “advised she arrived at work at 8:45 A.M. on November 22, 1963 and immediately reported to main office where she was employed...she went outside to watch the presidential parade about 11:25 A.M...she stood in the last line of spectators nearest the door to the School Book Depository building...she could not recall the exact time but immediately after the Presidential parade passed she heard three loud blasts and she immediately realized that the shots or whatever it was came from the building above her...Mr. Campbell, Office Manager, arrived shortly after the police officer entered the building and she told him the blasts came from the upper part of the building however he insisted the shots came from the embankment.” (3-19-64 statement to the FBI, 22H672) “At approximately 12:20 PM on November 22, 1963, I left the lunchroom on the second floor of the building and went out the front entrance to await the arrival of the presidential motorcade which I knew was due to pass the Depository about 12:30 PM. I took up a position at the top of the front steps of the Depository building facing Elm Street. To the best of my recollection, I was standing on the top step at the east end of the entrance. I recall that while standing there I noticed Mrs. Sarah Stanton standing next to me, but I am unsure as to the others. Mrs. Stanton is likewise an employee of the Texas School Book Depository. To the best of my recollection I did not see Lee Harvey Oswald at any time on November 22, 1963, and although I knew him by sight as an employee of the building I did not know him by name and had never spoken to him at any time. I do not recall seeing any strangers in the Texas School Book Depository Building at any time on the morning of November 22, 1963. After the motorcade car carrying President John F. Kennedy passed, I remained a moment on the steps, then walked out to the concrete island in front of the Depository Building to see what had happened. I remained there a moment and then returned to the Depository Building through the main entrance. I then walked to the second floor where I usually worked.” **Analysis:** Although Mrs. Saunders tells us almost nothing on how the shots were fired, her brief statements are at least of some assistance in clearing up some other mysteries. For one, she says she left the lunch room at 12:20, but has no recollection of seeing Oswald on the day of the shooting. This works against Oswald's being in the second floor lunch room at that time. For two, she says she stood on the east side of the top step, and worked on the second floor. This, along with Billy Lovelady's claim the woman shielding her eyes in the Altgens photo worked on the second floor, suggests the possibility Saunders was this woman. If not her, then Stanton. **Too vague.**

Otis Williams (11-24-63 FBI report, CD5 p.64) “at the time the Presidential procession passed the Texas School Book Depository Building, Williams was on the front steps of the building. The Presidential car had just passed the building a few seconds and was out of sight over the embankment when Williams heard three loud blasts. He thought these blasts came from the location of the court house.” (2-18-64 report of the Dallas Police Department, box folder 19 file 20 of the Dallas JFK Archive) "He heard three shots that sounded like they were coming from the west side of the Texas School Book Depository. The president's car had gotten out of Mr. Williams' view when he heard the shots." (3-19-64 statement to the FBI, 22H683) “On November 22, 1963, at the time the Presidential

motorcade passed the Texas School Book Depository, I was standing on the top step against the railing on the east side of the steps in front of the building. I do not recall who was standing at either side of me, but I do know that Mrs. Robert E. Saunders, also an employee of the Texas School Book Depository, viewed the motorcade. Just after the presidential car passed the building and went out of sight over the Elm Street embankment I heard three loud blasts. I thought these blasts or shots came from the direction of the viaduct which crosses Elm Street. I did not then know that President Kennedy had been shot. I remained momentarily on the steps and then returned inside the building.” (No More Silence p.116-120, published 1998) “when the motorcade came around the corner and then made that bend to get to the underpass, I had a clear view as it passed by of the President and all in the car, and then it went behind a little wall going toward the underpass. Probably five or ten seconds later is when I first thought I heard the shots. The first one I assumed someone threw a firecracker... It was about five or ten seconds before he was hit when he went out of my sight. I definitely heard three shots. Fact is, as soon as the third shot happened, and everybody commenced milling around, I thought it came from the underpass.” **Analysis:** even though Williams’ location for the shots appears to have changed (or maybe the FBI simply screwed up in their 11-24 report) he was consistent all along that the limousine had been out of his view for a number of seconds before the first shot was fired. This indicates the first shot rang out after frame 160. **First shot 190-224.**

Joe Molina (11-23-63 report of the Dallas Police Department, box 3 folder 19 file 15 of the Dallas JFK Archive) "He states that he heard three shots; he did not know where they came from." **(3-25-64** statement to the FBI, 22H664) “the car in which President Kennedy was riding passed the building... Just after his car disappeared from my view I heard three shots.” **(4-7-64** testimony before the Warren Commission, 6H368-373) "I was standing on the front steps...Right next left of me was Mr. Williams and close to there was Mrs. Sanders." (When asked what happened after the car passed) "I heard the shots...Sort of like it reverberated... kind of came from the west side...Of course, the first shot was fired then there was an interval between the first and second longer than the second and third.” **Analysis:** the familiar scenario. **First shot hit 190-224. Last two shots bunched together.**

Roy Lewis (12-9-63 FBI report, CD205, p23) “viewed the Presidential motorcade and heard the shots...but could offer no information as to where the shots had come from.” **(2-18-64** report of the Dallas Police Department, CD950, p.54) "Subject stated that he was in the entrance of the building when the president was assassinated." **(3-18-64** statement to the FBI, 22H661) “I stood by myself on the inside of the entrance to the Texas School Book Depository to watch President John F. Kennedy come by the building in a motorcade. I heard three shots fired from somewhere above me, but was unable to see the person who fired them.” (No More Silence, p.84-89, published 1998) “I was standing with some ladies from up in the offices right in the middle of the steps in front of the building that led to the sidewalk beyond the glass door. As the motorcade came by, I remember seeing Kennedy brushing back his hair. That’s when all hell broke loose! I heard BOOM!... BOOM!... BOOM! with the second and third shots being closer together. The people down in front of me hit the ground then everybody started running toward the grassy knoll... I didn’t see any smoke or smell any gunpowder, nor could I tell the direction of the shots because it was like an echo there. But no way did I suspect anything coming from the Texas School Book Depository.” **Analysis:** Lewis’ recent recollection differs quite a bit from what he told the FBI. Perhaps he was trying to keep the names of the women on the front steps out of his statement. As Kennedy brushed back his hair around Z-140, it’s possible Lewis is describing the LPM scenario. Still, since he says the last two shots were grouped together, it seems likely a few seconds passed before the first shot. **Probable first shot hit 190-224. Last two shots probably bunched together.**

In the Building

At left: a photo by Tom Dillard taken just seconds after the shooting. Bonnie Ray Williams, L, and Harold Norman, R, can be seen in the windows just below the sniper's nest.

Above: a crop of CE 882, with the Z-film locations of Kennedy added in. Blue arrows show relative perspectives of Dorman and Wilson.

At left: a photo taken by Jack Weaver as the limo turned up Houston, with the School Book Depository in the distance. The colored circles reflect the locations of various witnesses. Red= Williams and Norman. Orange=James Jarman. Pink=Elsie Dorman and the fourth floor women. Dark blue=Steven Wilson. Light blue=the sniper.

In the Building

If the LPM scenario is to be accepted then certainly the majority of those closest to the shooting, some only a few feet from the sniper's nest, would have heard the shots as laid out by Lattimer, Posner, and Myers, with a five second gap between the second and third shots...

Troy West (12-7-63 Secret Service Report based on interviews conducted between 12-2 and 12-5, CD87 p785) "at the time of the president's assassination, he was just starting to eat his lunch on the first floor of the building near where he normally works. He heard the shots fired and stated that before he could leave the building, many people came in, including many police officers." (3-18-64 statement to the FBI, 22H679) "When President John F. Kennedy was shot I was on the first floor making coffee for the employees. I was alone at the time and did not know at the time that President Kennedy had been shot. I was walking toward the front of the building when people rushed in the building and told me that someone had shot President Kennedy." (4-8-64 testimony before the Warren Commission 6H356) "I had started to eat my lunch. But before I got through, well all of this was, I mean the police and things was coming in, and I was just spellbound. I just didn't know what was the matter...(When asked if he heard the shots) "I didn't hear a one. Didn't hear a one." **Analysis:** first he hears 'em then he don't. What's that about? **Too vague.**

Eddie Piper (11-23-63 statement to the Dallas County Sheriff's Department, 19H499) "I went to a front window on the first floor ...I saw the President pass and heard some shots...The shots seemed to me like they came from up inside the building." (12-20-63 FBI report, CD206 p13) "While looking out

the window, he heard what he believed to be three shots and saw people running, and later determined the President had been shot. He did not view the Presidential motorcade itself inasmuch as the crowd was in his line of sight, and did not see Lee Harvey Oswald after the shots were fired." (2-17-64 report of the Dallas Police Department, CD950, p45) "Subject gave the following information..." "During the presidential parade, I was standing by a window on the lower floor at the front of the building watching the cars pass when I heard this shot. It shook the window and I moved away from the window and looked at the clock. It was exactly 12:25 P.M. Some more shots were fired. I distinctly heard three shots in all. Some one said they were coming from the railroad tracks, I said no they are coming from the top of the building." (3-18-64 statement to the FBI, 22H668) "When President John F. Kennedy was shot, I was sitting on a box on the first floor of the Texas School Book Depository watching the parade from the window. I could not see the president's car from where I was sitting but I heard three shots ring out and saw people looking up at the building. It seemed to me the shots came from inside the Texas School Book Depository." (4-8-64 testimony before the Warren Commission, 6H380) (When asked which window he was looking out) "it's the second window from the corner...I couldn't see anything--too many people...I heard one shot, and then the next shot went off, and I got up and went on back, back where they make coffee at the end of the counter where I could see what happened and before I could get there, the third shot went off, and I seen the people all running." (When asked if he could tell where the shots came from) "No, sir, not for sure." **Analysis:** Piper's telling the DPD that he looked at the clock after the first shot suggests there was a larger gap between this shot and the second than between the second and the third, but is a little **too vague**.

Geneva Hine was manning the phones in the second floor offices of the Texas School Book Depository, on the west end of the building. (11-23-63 FBI report, CD5 p369-370) "Mrs. Hine advised that sometime between 12:25 PM and 12:35 PM she was alone in her office on the second floor of the company building...At approximately that time she heard what she described as three shots. She heard these very distinctly and believes they came from somewhere inside the building, inasmuch as it sounded to her that the shots originated above and to the west of her." (11-23-63 report of the Dallas Police Department, box 1 folder 8 file 52 of the Dallas JFK Archives) "Was in the office alone the day of the shooting heard three shots and did not know what happened until the Police came in the office and told the president had been shot." (3-18-64 statement to the FBI, 22H651) "At the time President Kennedy was shot I was on the second floor of the Texas School Book Depository Building. I was alone at the time." (4-7-64 testimony before the Warren Commission, 6H393-397) "I could see it from the east window of our office...I saw the President's car coming and I saw the President and saw him waving his hand in greeting up in the air and I saw his wife and I saw him turn the corner and after he turned the corner I looked and I saw the next car coming. Just at the instant I saw the next car coming up was when I heard the shots...Three...they came from inside the building...the building vibrated from the result of the explosion coming in...they sounded almost like cannon shots they were so terrific." (When asked if she was standing at the window at the time of the shots) "Yes, sir; that is when I was at the window, because the next car, you see, was coming up and turning and I looked. Of course I looked when I heard the shots. I just stood there and saw people running to the east up Elm Street. I saw people running; I saw people falling down, you know, lying down on the sidewalk." **Analysis:** Ms. Hine's testimony, if taken literally, would indicate the first shot missed somewhere back before the beginning of the Zapruder film sequence of the motorcade on Elm, at a time when Tina Towner was still filming the Presidential limo's turn onto Elm. Perhaps, by the "next car", then, she simply meant that the next car holding a politician was coming up to the corner when the first shot was fired. This would be the Lincoln holding Vice-President Johnson. If so, then her words are more compatible with the LPM scenario than with a first shot 190 scenario. If she meant the "next car" to mean the Presidential back-up car, however, then her words are incompatible with the LPM scenario as well as most other scenarios. Her statement that "Of course, I looked when I heard the shots" and then

describing people falling down--which did not happen until after the head shot--suggests that she was not paying much attention at the time of the first shot. In support of this is the fact that she never mentioned looking out the window until 4 1/2 months after the shooting. Her statement that she could tell the shots were from inside the building, by the way, is refuted by nearly every other witness in the building, and suggests she was not above exaggerating for the sake of self-grandification. Those nevertheless using this assertion as evidence Oswald fired all the shots from the sniper's nest ignore that she originally said she thought the shots came from above and to the west--which would indicate an open window on the west end of the building, where Arnold Rowland claimed to have seen a man with a gun. **Possible LPM scenario.**

Mrs. Carol Hughes (3-20-64 statement to the FBI, 22H654) "I am employed by the South-Western Publishing Company, Room 203, Texas School Book Depository...On November 22, 1963, I went to south window near my desk which overlooks Elm Street to watch the Presidential motorcade pass along Houston and Elm Streets. I was standing looking out this window when President John F. Kennedy was shot. I was alone in the office as all the other people had gone to the street to watch the motorcade pass." **Analysis: too vague.**

Steven Wilson (1-9-64 FBI report, CD329 p.27) "Due to a large tree being in the way he could not view the entire procession, but as his view became obstructed, he heard three distinct shots which he thought came from a rifle." **(3-25-64** statement to the FBI, 22H684) "the fatal shots at the President were fired from a storage area which is three floors directly above my private office...I left my private office and went in my company's main office...From my position, I watched the motorcade as it approached, moving north on Houston Street, and turned west on Elm street...As the motorcade proceeded, my view of President Kennedy and his car and the other occupants, became obscured by some trees which are on Elm Street. In a matter of ten seconds or less after the President's car and occupants were obscured from view by the trees, I heard three shots...It is my opinion there was a greater space of time between the second and third shots than between the first and second. The three shots were fired within a matter of less than five seconds...At that time it seemed the shots came from the west end of the building or from the colonnade located on Elm Street across from the west end of our building...at the time the President's car and its occupants went out of my view, being obscured by the trees, as mentioned above, the car was not as far as 100 yards from me." **Analysis:** since the shots occurred "In a matter of ten seconds or less" after the limousine disappeared and the shots themselves were fired within a five second span, Wilson implies the shots began several seconds after the limo disappeared behind the tree. It did so around 160. **Possible LPM scenario. Probable first shot 190.**

Doris Burns (2-18-64 report of the Dallas Police Department, box 3 folder 19, file 2 of Dallas JFK Archive) "Miss Burns had the radio on and heard the motorcade was close to her location. She walked to Mr. Wilson's office on the third floor facing Elm Street. The window was open and she heard the last shot before she got to the window." **(3-19-64** statement to the FBI, 22H637) "at the time President John F. Kennedy was assassinated I was walking from my office...While walking I heard one loud noise which sounded like a shot." **(4-7-64** testimony before the Warren Commission, 6H397-399) "I went around to American Book Co., which is the office closest to us that had a window looking out on Elm. There was nobody in there, so then I started down the hall to Allyn and Bacon. As I went down this hall towards the windows that looked out on Houston Street, I heard a shot, but I didn't think much about it. I didn't, of course, know it was a shot because when you hear tires backfire and all, they all sound alike to me, so I didn't think a thing about that... It must have been the last one because I didn't hear any more...it just sounded as though it was back of me. You see, I was going towards Houston Street. I was facing east and it sounded to me as it came toward my back." **Analysis:** Miss Burns' statements support that the final loud noise came from west of the building. **Too vague.**

Sandra Sue Elerson (11-25-63 FBI report, CD5, p. 433) "On November 22, 1963, she was assigned

for work by the Kelly Girl service at the MacMillan Company in the Texas School Book Depository Building...When the President's motorcade passed the Texas School Book Depository building, Mrs. Elerson stated that she was looking out the third floor window on the south side of the building. She saw the President turn the corner at Elm. She failed to hear any shots fired." (3-23-64 statement to the FBI, CD706, p. 29) "When President Kennedy's motorcade passed the Texas School Book Depository building, I was looking out the third floor window trying to get a view of the President's car. I am nearsighted and I am not sure if I saw the President's car. However, I did see a car turn down Elm Street from Houston Street that may have been the President's car. I was standing at the window with an elderly woman from the MacMillan Company office. I cannot recall her name. I did not hear any shots or any loud sounds that sounded like rifle fire...I learned that President Kennedy had been shot after I returned to my desk." **Analysis: too vague.**

Mrs. Edna Case (11-24-63 FBI report, CD5, p. 431) "At the time the President's motorcade passed, she advised she was on the third floor of the building at her desk. She stated that she was looking out the west side of the building and not the front. She said she had not heard the shots." (2-18-64 report of the Dallas Police Department, CD950, p.51) "The subject stated that on November 22, 1963 she was in the offices of the MacMillan Publishing Company on the third floor of the Texas School Book Depository Building at the time the Presidential motorcade was passing the building. She stated that she had only heard of the shooting after it had occurred. She stated that she did not know Lee Harvey Oswald and that, as far as he knew, she had never seen him around the building." (3-20-64 statement to the FBI, CD706, p.111) "On November 22, 1963, at the time the motorcade was passing the Texas School Book Depository Building and President John F. Kennedy was assassinated, I was at my desk on the third floor looking out the window located on the west side of the building. I did not hear any shots and the only person in the same area with me was Mrs. Sandra Elerson, who was a temporary employee with the Kelly Girls organization." **Analysis: nothing to go on. Too vague.**

Mary Ann Hollies was in the fourth floor offices of Scott Foresman Company, apparently looking out the seventh and eighth windows from the east with a woman named Alice Foster. (2-18-64 report of the Dallas Police Department, box 3, folder 19, file 11 of the Dallas JFK Archive) "At about 12:35 PM, Miss Hollies heard three shots, just as the President's car was headed down toward the triple underpass. She stated the shots sounded as if they were coming from inside the building." (3-19-64 statement to the FBI, 22H652) "On November 22, 1963...I was standing at the window of the Scott-Foresman offices overlooking Elm Street...As the motorcade passed by I heard three shots and observed the President slump over in the automobile in which he was riding." **Analysis: she doesn't tell us anything about when this slump occurred in relation to the shots. Too vague.**

Betty Foster (3-19-64 statement to the FBI, CD706, p. 31) "When President John F. Kennedy was shot I was standing in the stockroom on the fourth floor watching the motorcade. I was with Mary Hollies...I heard something that sounded like fireworks after the President's car turned down Elm Street but I wasn't sure what it was. I did not know what had happened." **Analysis: too vague.**

Elsie Dorman (11-24-63 FBI report, CD5 p.34) "She stated that she had never seen Lee Harvey Oswald in the building and failed to recognize his photographs when shown on television. When the President's motorcade passed, Mrs. Dorman advised she was looking out the window on the fourth floor...It was at this time she heard sounds which sounded like shots. She felt that these shots were coming from the area of the Records Building." (3-20-64 statement to the FBI, 22H644) "I was using my husband's camera and was not too familiar with its operation. As the motorcade turned onto Houston Street from Main Street, I started taking photographs...as the motorcade turned from Houston Street on to Elm Street I became excited and did not get any more photographs. I was at this window attempting to photograph the motorcade when I heard a noise like gunshots...I do not know Lee Harvey Oswald and have no recollection of having seen him." **Analysis: Dorman's film is one of the**

least understood or analyzed pieces of evidence surrounding the assassination. While there is a blur on the film a second or so after Rosemary Willis runs by the fountain, which could have come as a result of a shot at frame 160, Mrs. Dorman stopped filming at this time, raising the possibility the blur was caused by her stopping the film. Even so, as her film shows camera car #3 and H.B. McLain approaching Elm Street 10 seconds after we last see Miss Willis, Mrs. Dorman's film is invaluable in debunking the dictabelt evidence. **Too vague.**

Dorothy Ann Garner (3-20-64 statement to the FBI, 22H648) (I) "was watching the Presidential motorcade through a window...the fifth window from the east end of the (Texas School Book Depository) building. I recall that Mrs. Elsie Dorman was sitting next to me at that time looking out the sixth window and that Victoria Adams and Sandra Styles were both standing next to Mrs. Dorman... I recall that moments following the passing of the Presidential car I heard three loud reports which I first thought to be fireworks but only seconds later realized something had happened on the street below although at the time of the shots, the Presidential car was out of view behind a tree. I thought at the time the shots or reports came from a point to the west of the building...I do not recall ever having seen Lee Harvey Oswald at any time prior to the assassination." **Analysis:** yet another employee of the school book depository who had no recollection of Oswald whatsoever and who would therefore have had no idea what a stranger in the building would look like. **Too vague.**

Sandra K. Styles (3-19-64 statement to the FBI, 22H676) "On November 22, 1963, I was in my office at a window facing Elm Street watching the Presidential motorcade at the time President Kennedy was shot. Also present at this window with me were Dorothy Garner, Elsie Dorman, and Victoria Adams...I never knew Lee Harvey Oswald, not even by sight as an employee at the building...I heard shots but thought at the time that they were fireworks. I was unaware of the place the shots came from. I saw people running and others lie down on the ground and realized something was happening but did not know exactly what was happening. Victoria Adams and I left the office at this time, went down the back stairs, and left the building at the back door." **Analysis:** no recollection of Oswald. **Too vague.**

Victoria Adams (11-24-63 FBI report, CD5 p.39) "as the car...was passing, she heard three loud reports which she first thought to be fire crackers...and she believed the sound came from toward the right of the building...After the third shot she observed the car containing President Kennedy to speed up and rush away." (2-17-64 statement to the Dallas Police Department, box 3 folder 19 file 3 of the Dallas JFK Archive) "When the President got in front of us I heard someone call him and he turned. That is when I heard the first shot. I thought it was a firecracker. Then the second shot I saw the Secret Service man run to the back of the President's car. After the third shot I went out the back door." (3-23-64 statement to the FBI, 22H632) "I recall that at about 12:30 PM, just after the car carrying President Kennedy had passed on the street below, I heard three loud reports which I first thought were firecrackers...After the third shot I observed the car carrying President Kennedy speed away." (4-9-64 testimony before the Warren Commission, 6H386-393) "I watched the motorcade... proceed around the corner on Elm, and apparently somebody in the crowd called to the late President, because he and his wife both turned abruptly and faced the building... from our vantage point we were able to see what the President's wife was wearing, the roses in the car...Then we heard—then we were obstructed from the view...A tree. And we heard a shot, and it was a pause, and then a second shot, and then a third shot. It sounded like a firecracker or a cannon at a football game, it seemed as if it came from the right below rather than from the left above." (2-2-02 interview with Barry Ernest recounted in *The Girl On The Stairs*, published 2011) "As they rounded the corner, they turned toward our building, waving and smiling. The car continued moving slowly and a tree obstructed my view. That is when I heard what I thought was a firecracker go off. As the car came back into view I saw that something was wrong and watched as Mrs. Kennedy appeared to be trying to climb out of the car." **Analysis:** Adams' testimony that she saw Kennedy suddenly turn to his right before the first shot confirms Mary Woodward's

account and that the first shot rung out around frame 190. Her mentioning a pause after the first shot, but not between the second and third suggests the last two were bunched together. **First shot 190. Last two shots bunched together.**

Ruth Smith Nelson (2-18-64 report of the Dallas Police Department, box folder 19 file 16 of the Dallas JFK Archive) "she went to the fourth window from the east side of the building facing Elm Street. She stood up and watched the motorcade. She heard the three loud reports and thought they were part of the celebration." **(3-23-64** statement to the FBI, 22H665) "at the time President John F. Kennedy was assassinated I was viewing the motorcade from the fourth window on the east side on the fourth floor along with Mrs. Yola Hopson...I did not see Lee Harvey Oswald at this time and have not to my knowledge ever seen Lee Harvey Oswald." **Analysis: too vague.**

Mrs. Yola Hopson (12-4-63 FBI report, 24H521) "she was looking out a window on the south side of the fourth floor of the TSBD Building when the motorcade of President John F. Kennedy passed in front of the building...Immediately after he passed, she heard two or more loud shots which she thought were firecrackers. She stated that she thought they had been set off on the street below...at the time she heard these shots she could not see the presidential car since there were some trees along the edge of the street which blocked her view...She stated that it did not sound to her like the shots were coming from her building...she does not know Lee Harvey Oswald and does not recall ever having seen him." **(3-19-64** statement to the FBI, 22H653) "I heard an unrecalled number of loud noises which I thought sounded like firecrackers. I could not view the position of President John F. Kennedy due to the trees in front of the building." **Analysis: too vague.**

Jack Dougherty (11-22-63 Affidavit to Dallas County Sheriff's Department, 24H206) "I had already gone back to work and I gone down on the fifth to get some stock when I heard a shot. It sounded like it was coming from inside the building but I couldn't tell from where. I went down on the first floor and asked a man named Eddie Piper if he had heard anything and he said yes, that he had heard three shots." **(11-23-63** statement to the FBI, 22H645) "I was working on the fifth floor of the building at 411 Elm Street...when I heard a loud explosion which sounded like a rifle shot coming from the next floor above me." **(12-19-63** FBI report, CD 206, p.11) "He stated that as soon as he arrived on the sixth floor, he went down to the fifth floor to get some stock...it was while he was on the fifth floor that he heard a loud noise. He said that it appeared to have come from within the building but could not tell where. He said that he went down to the first floor and saw a man, Eddie Piper, and asked if he had heard a loud noise." **(3-18-64** statement to the FBI, 22H645) "At the time President Kennedy was shot I was at a point about 10 feet from the elevator on the fifth floor of the Texas School Book Depository Building. I was alone at the time." **(4-8-64** testimony before the Warren Commission, 6H373-382) "Well, when I got through getting stock off of the sixth floor, I came back down to the fifth floor...Well, then immediately I heard a loud noise---it sounded like a car backfiring, and I came back down to the first floor, and I asked Eddie Piper, I said, "Piper, what was that?" I says, "Has the President been shot?". He said, "Yes..."(When asked if he'd previously told the FBI the sound was of a rifle shot) "Well; I believe I told them it sounded like a car backfiring." (When asked if he'd said it was from the floor above him) "No." (When asked if it did sound like it came from the floor above him) "Well, at the time it did---yes." (When asked where he was when he heard this sound) "Well, I was about 10 feet from the west elevator---the west side of the elevator...I was getting some stock." **Analysis: why only one shot? Too vague.**

Since there has been virtually no support for the LPM scenario so far, one might assume that the closest witnesses, those in the windows just below the sniper's nest, would offer some support that the first shot missed, or that there was a five second gap between the second and third shots. Wrong.

James Jarman was the order checker who double-checked Oswald's orders for accuracy. Portions of his story beyond his account of the shots are presented so one can properly assess his credibility, along

with those of the two men beside him. (11-23-63 Affidavit to the Dallas County Sheriff's Department, CD87 p274) "The first time I saw Lee Oswald on Friday, November 22, 1963 was about 8:15 a.m. He was filling orders on the first floor. A little after 9:00 a.m. Lee Oswald asked me what all the people were doing standing on the street. I told him that the President was supposed to come this way sometime this morning. He asked me, "Which way do you think he is coming?". I told him that the President would probably come down Main Street and turn on Houston and then go down Elm Street. He said, "Yes, I see". I only talked with him for about three or four minutes. The last time I saw Lee Oswald on Friday, November 22, 1963 was between 11:30 a.m. and 12:00 noon when he was taking the elevator upstairs to go get some boxes. At about 11:45 a.m. all of the employees who were working on the 6th floor came downstairs and we were all out on the street at about 12:00 o'clock noon. These employees were: Bill Shelley, Charles Givens, Billy Lovelady, Bonnie Ray (last name not known) and a Spanish boy (his name I cannot remember). To my knowledge Lee Oswald was not with us while we were watching the parade." (11-24-63 FBI report, CD5 p334-335) "Jarman stated that on November 22, 1963, he observed Oswald on the first floor of the TSBD Building, around 8:15 a.m. He stated Oswald had filled an order for books that was not correct and that he, himself, told Oswald to obtain the right book inasmuch as he, himself, is an order checker. He said he next saw Oswald about 9 a.m., or possibly a little later. Jarman said Oswald looked out the window and observed that people were gathering outside the building and asked him why they were there. Jarman told him the President of the United States was supposed to come by sometime that morning. He stated Oswald asked him which way the procession would be going and Jarman told him he thought probably it would be going down Main street, turning on Houston, and then on Elm street. He said he next saw Oswald between 11:30 a.m. and 12 noon, when Oswald was taking the elevator to an upper floor, at which time they had no conversation. Oswald had an order-filler pad. Jarman said that as the president passed by, he, himself, was watching the procession from a fifth floor window of the TSBD building...He said that he heard a shot and then saw President Kennedy move his right hand up to his head. After an elapse of three or four seconds, he heard a second shot and then the vehicle bearing President Kennedy speeded up and he was unable to observe any more about the presidential vehicle. He said a third shot was heard by him closely following the second shot possibly within a second or two afterwards. He said these shots sounded to him to be too loud to have been anywhere outside the TSBD building. Jarman said that he and Harold Norman and Bonnie Ray (LNU) went to the west side of the building on the fifth floor where they discussed the shots. He said they decided the shots had come from inside the building because they were too loud to have come from outside the building. He said that Harold Norman stated at that time that something had fallen from above him and that a piece of debris, in addition, had hit him in his face..." (12-7-63 Secret Service Report based on interviews conducted between 12-2 and 12-5, CD87 p785) "about 9:00 A.M., Oswald had asked Jarman why all the people were standing in front of the building. Jarman replied that the parade would probably come down Main street, turn on Houston, and then go down Elm street. Oswald's reply was 'yes, I see.' Jarman later saw Oswald taking an elevator and going up. This was after 11:30 A.M. Jarman and the other members of the floor-laying crew returned to the first floor by elevator shortly before noon for the lunch period...After eating lunch, Jarman went with Williams and Norman to the fifth floor...Jarman was standing near Williams in a front window overlooking Elm street when the parade went by and a moment later he heard three shots." (3-18-64 statement to the FBI, 22H655) "At the time President Kennedy was shot I was at the third window from the east side on the fifth floor. I was with Harold Norman...and Bonnie Ray Williams." (3-24-64 testimony before the Warren Commission, 3H198-211) (On seeing Oswald earlier that day) "It was between 9:30 and 10 o'clock, I believe...In between two rows of bins...On the first floor...Well, he was standing up in the window and I went to the window also, and he asked me what were the people gathering around on the corner for, and I told him that the President was supposed to pass that morning, and he asked me did I know which way he was coming, and I told him, yes; he probably come down Main and turn on Houston and then back again on Elm. Then he said, "Oh, I see,"

and that was all." (On whether he saw Billy Lovelady out front shortly before the shooting) "Yes, sir...Standing on the stairway as you go out the front door." (On the shooting) "After the motorcade turned, going west on Elm, then there was a loud shot, or backfire, as I thought it was...A backfire or an officer giving a salute to the President. And then at that time I didn't, you know, think too much about it. And then the second shot was fired, and that is when people started falling on the ground and the motorcade car jumped forward, and then the third shot was fired right behind the second one...after the third shot was fired, I think I got up and I run over to Harold Norman and Bonnie Ray Williams, and told them, I said, I told them that it wasn't a backfire or anything, that somebody was shooting at the President...Hank said, Harold Norman, rather, said that he thought the shots had come from above us, and *I noticed that Bonnie Ray had a few debris in his head*. It was sort of white stuff, or something, and I told him not to brush it out, but he did anyway...He (Norman) said that he was sure that the shot came from inside the building because he had been used to guns and all that, and he said it didn't sound like it was too far off anyway. And so we ran down to the west side of the building...I couldn't say that I saw him actually hit, but after the second shot I presumed that he was...I saw him lean his head... (When asked from where he'd heard the shots) "I thought at first it had come from below...I am sure it came from the left. (When asked if he had any doubt that the sounds he heard were gunshots, given that he'd had 8 years in the military) "Not after the second shot." (When asked at what point he realized the shots came from above) "After we had ran down to this last window on the west side of the building, and we was discussing it. And then *after I got to thinking about all the debris on Bonnie Ray's head*, and I thought about that, also. And so I told Hank, I say, "That shot probably did come from upstairs, up over us," and Hank said, "I know it did, because I could hear the action of the bolt, and I could hear the cartridges drop on the floor." And I told him there we better get the hell from up here. (Interview with CBS, aired 6-25-67) (On seeing Oswald earlier in the day) "I was talking to him around ten o'clock. On the outside of the building, some people had gathered. And he asked me what was they gathering around out there for, and I told him that the President was supposed to come by there that morning. And he asked me what time, and I didn't know what time it would be but some of the people had started gathering around. And he asked me which way would the President be coming, and I told him. And so he said, "Oh, yeah?" And I said "Yeah." Then he turned and walked off." (9-25-77 HSCA interview) "when the motorcade arrived, and just as it was turned to go west under the triple under pass, that's when I heard what sounded like a backfire to me and, I counted the times that it backfired, and it was three times and then, after that, after I heard this second or third backfire, in which I thought it was--the president then, he reached up to his temple like, and I thought he was brushing his hair back, but then, I realized someone was shooting at him, then we ran to the west side of the building to see which way the motorcade was going to go then, and the limousine that he was in, it took off at a high rate of speed, so we ran back to the center of the building, and *I noticed that Harold Norman had a bunch of debris in his head, which I imagine was dust from above, upstairs there on the sixth floor, and told Bonnie Ray, I said 'Man, you see all that debris in Hank's hair,' he said 'yeah man' Hank said 'Man them shots came from upstairs, what we gone do?'*" (When asked from where he thought the shots were coming) "Well, I thought it was out on the street at first." (On Oswald's reaction earlier in the day after he'd been told why the crowd was gathering outside) "He just said, 'Oh, I see,' and went on and walked away." (When asked the number of mistakes Oswald had made that day) "I'd say about three or four." (When asked what floors Oswald worked on) "First, fifth, sixth, seventh." (When asked the time of Oswald's last mistake) "11:25, 11:30, then he went and got the book and brought it back and that was the last time I saw him inside the building." (When asked if a stranger could have walked into the depository building and made it to the sixth floor without being noticed) "Very easily." **Analysis:** as Jarman heard the last two shots close together and saw both Kennedy "lean his head" and people fall to the ground after the second shot, he is a strong witness that the last shot was fired after the head shot. Jarman's story is inconsistent on other points, however. Apparently, he couldn't remember upon whose head he saw the "debris" after the shots. He also told the HSCA that he saw Oswald on the first floor

after he'd taken the elevator upstairs around 11:30--something he'd previously never admitted, or remembered. **First shot hit 190-224. Last two shots bunched together (with the last shot after the head shot).**

Bonnie Ray Williams (11-22-63 affidavit to Dallas County, 24H229) "Just after we got on the fifth floor we saw the President coming around the corner on Houston from Main Street. I heard 2 shots it sounded like they come from just above us. We ran to the west side of the building." **(11-23-63** FBI report, CD5 p330-333) "Then he joined two other men known to him as Hank and Junior. They were looking out windows on the south side of the building approximately at the middle of the building and saw the car of President John Kennedy come north on Houston Street and then make a turn going west on Elm Street down into the triple underpass directly in front of the Texas School Book Depository. While they were watching this car pass, Williams heard two shots which sounded like they came from right over his head...He stated he and the other two men ran to the west end of the building where they looked out and they did not realize the President had been shot." **(12-7-63** Secret Service Report based on interviews conducted between 12-2 and 12-5, CD87 p784) "he can recall having heard only two shots. He felt that the shots came from the sixth floor but he did not hear the shells fall to the floor nor did he hear the bolt action of the rifle." **(3-19-64** statement to the FBI, 22H681) "As the presidential motorcade passed by the building on Elm Street below I heard three shots which sounded like they came from directly above me. At first I thought the noises I heard were firecrackers. *I looked up when little pieces of cement hit me on the head*, but saw no one. I did not know that President John F. Kennedy had been shot. When I saw all of the confusion on the street below I ran to the west end of the building to get a better view. Hank and Junior who were on the floor with me also ran to the west end of the building."

(3-24-64 testimony before the Warren Commission, 3H161-184) "After the President's car the last thing I remember seeing him do, you know—it seemed to me he had a habit of pushing his hair back. The last thing I saw him do was he pushed his hand up like this. I assumed he was brushing his hair back. And then the thing that happened then was a a loud shot—first I thought they were saluting the President, somebody even maybe a motorcycle backfire. The first shot—there was two shots rather close together. The second and the third shot was closer together than the first shot and the second shot, as I remember...the first shot—I really did not pay much attention to it, because I did not know what was happening. The second shot it sounded like it was right in the building, the second and third shot. And it sounded—it even shook the building...Harold was sitting next to me...He said it came directly over our heads...I can even hear the shell being ejected from the gun hitting the floor...I heard three shots, but at first I told the FBI I only heard two--they took me down--because I was excited, and I couldn't remember too well. But later on, as everything began to die down, I got my memory even a little better than on the 22nd. I remembered three shots, because there was a pause between the first two shots. There was two real quick. There was three shots." (Interview with CBS, broadcast **9-27-64**) "The last thing I saw the President do was push his hair back, and the only comments made about the President were that his tan was beautiful, and also that his health was looking good that day." (On what happened after people started falling on the ground) "So we said, "Well, somebody's shooting at the President." And then—at first we didn't believe it, because it just seemed so untrue, you know—and then the other fellow, Harold Norman, said, "Yes, I believe he's been shot at." (Interview with CBS broadcast on **6-25-67**, additional portions broadcast in 1992) "When the President came around, we remember seeing him standing up and waving. And then when he turned to go down Elm Street we heard a shot and we saw the President slump. And then after we saw him slump, we said--I think one guy, I don't remember which one it was-- said "I believe they're shooting at the President and I believe it came from right up over us."...Prior to that we'd decided they were firecrackers and everything, y'now." (When asked how many shots) "I heard three. The first and the second were further apart than the second and the third. In other words there was a bang and a bang-bang." **Analysis:** as Williams

initially mentioned but two shots, it seems obvious he only recalled hearing two clear shots. After being told by everyone there were three shots, and given time to analyze how the shots sounded, however, he switched to saying the last two shots were very close together (so close together that he referred to them as an "it" in his Warren Commission testimony). He said they were "bangbang". Whether he only heard two shots or whether the last shots were simply bunched together, however, doesn't matter, as far as our analysis of the LPM scenario goes, as both suggest there was more than one shooter in Dealey Plaza. Williams was only ten feet from the sniper's nest and yet he heard only two bursts of gunfire! His statement that the last thing he saw Kennedy do was push his hand up is probably a reference to Kennedy's wave circa Z-190. He would have to have seen Kennedy for several seconds past Z-140, when Kennedy last brushed back his hair. Williams' original affidavit is also intriguing, as it suggests he was trying to hide that he'd been on the sixth floor. **First shot hit 190-224. Last two shots bunched together.**

Harold Norman (11-26-63 FBI report, CD5 p26) (On seeing Oswald earlier in the day) "He further stated he cannot recall whether he saw Oswald at the Texas School Book Depository during Friday, November 22, 1963." (On the shooting) "He stated that about the time the car in which the president was riding turned on to Elm Street, he heard a shot. He said he thought the shot had been fired from the floor directly above him. *He further stated at that time he stuck his head from the window and looked upward toward the roof but could see nothing because small particles of dirt were falling from above him.* He stated two additional shots were fired after he had pulled his head back in from the window." (12-4-63 affidavit to the Secret Service, 17H208) (On seeing Oswald earlier that day) "On November 22, 1963, to the best of my memory, the last time I saw him was about 10:00AM when we were both working on the first floor of the building. I did not speak to him at that time." (On the shooting) "Just after the President passed by I heard a shot and several seconds later, I heard two more shots. I knew that the shots had come from directly above me, and I could hear the expended cartridges fall to the floor. I could also hear the bolt action of the rifle. I also saw some dust fall from the ceiling of the fifth floor and I felt sure that whoever fired the shots was directly above me. I saw all of the people down on the street run toward the west side of the building, so I went to that side with Williams and Jarman." (12-7-63 Secret Service Report based on interviews conducted between 12-2 and 12-5, CD87 p783) "Just after the President passed their position, Norman heard a shot fired and several seconds later, he heard two more shots spaced closely together. Norman claims that he knew immediately that the shots had come from directly above his position, since he heard the bolt action of the rifle and he also heard the expended shells fall to the floor. Norman also claims that some dust fell from the ceiling of the fifth floor which convinced him that there was some type of activity taking place directly above him." (3-18-64 statement to the FBI, 22H666) "I was with James Jarman and Bonnie Ray Williams watching the motorcade bearing President John F. Kennedy pass the Texas School Book Depository Building when I heard three shots fired from, I believe, the floor directly above me." (3-24-64 testimony before the Warren Commission, 3H186-198) (On seeing Oswald earlier that day) (I saw him) "around about 10 or 10:15, somewhere in the neighborhood of that...Over in the bins by the windows, I mean looking out, you know, at Elm Street, towards Elm Street...(On) The first (floor)...I was looking out the window. He happened to come by to fill orders." (When asked if he said anything to Oswald and if Oswald had said anything to him) "No, he didn't...No" (On who else was out front when he and Jarman went outside) "Well, I believe Billy Lovelady, I think. He was sitting on the steps there." (On the shooting) "About the time that he got past the window where I was, well, it seems as though he was, I mean you know, brushing his hair. Maybe he was looking at the public...I can't remember what the exact time was but I know I heard a shot, and then after I heard a shot, well, it seems as though the President, you know, slumped or something, and then another shot and I believe Jarman or someone told me, he said "I believe someone is shooting at the President," and I think I made a statement "it is someone shooting at the President, and I believe it came from up above us. Well, I couldn't see at all during the time but I

know I heard a third shot fired, and I could also hear something sounded like the shell hulls hitting the floor and the ejecting of the rifle." (When asked if he saw any dirt or dust falling) "*I didn't see any falling but I saw some in Bonnie Ray Williams hair...* I believe Jarman told him that it was in his hair first. Then I, you know, told him it was and I believe Jarman told him not to brush it out his hair but I think he did anyway." (When asked what happened after that) "Well, we ran to the farthest window facing the expressway."

(Interview with CBS aired **9-27-64**) "Then the motorcade got to Elm and it turned and it started towards the triple underpass. The President, he was waving at people as he went by and occasionally he would brush his hair back." (Later in the same broadcast) "When I heard the second shot that's when I saw the people start falling on the ground." (Later in the same broadcast) "But before the third shot was fired I told the guys that, you know, I believed the shot came from the building above us. And eventually, I guess, they agreed with me, because one of the guys said 'I believe you're right.' And I said 'I know I'm right' because I could hear something sound as though the shells were hitting the floor and I could hear the ejection of the rifle, clicks like that, you know." (Later in the same broadcast) "Well, I was looking out the window and the first shot was fired. Well, y'know, I didn't think much of it, because it, shook the building a little bit. Really, it was just that powerful. Then after the second shot was fired, well, I saw the people. They were all falling on the ground. And I told one of the fellows. I say, 'That shot came from this building.' And then by that time I heard the third shot. And one of the guys told me, he said, 'I believe you're right.' And I say 'I know it did.' And then I could, you know, also hear the hulls, empty hulls, the cartridges, hitting the floor, and I could hear the ejection of the rifle, whatever it was. And the first thing we thought is we better get down from here because I know I didn't want to be involved in anything like that because I didn't have anything like that on my mind..." (Late 1966 interview with Lawrence Schiller recounted in *The Scavengers and the Critics of the Warren Report*, published **1967**) "When the President came around, he was waving, seemed to be happy. About that time I heard a shot, and one of the guys said 'Somebody's shooting at the President.' And I said : 'Well, he sure is, because I know that's a shot.' And another shot was fired. Then another shot. I saw the President slump over and the Secret Service men and the policemen, they seemed to not recognize where the shots came from. There was a passenger train over by the railroad track and everybody was running that way. That's where they thought the shots came from at first. But I knew it was someone, the shots came from above us. I didn't know who it was or where but I know they were above us because I could even hear the cartridges hitting the floor and I knew the shots came from above...They were right over me. I was sitting almost directly under the window that the shots came from and I could hear them very plainly...*One of the guys, some of the debris had dropped one one of the fellows' head, in his hair, and he mentioned it to the other fellow and we looked and there it was, in his hair.*" (Interview with CBS broadcast **6-25-67**, additional portions broadcast in 1992) (On seeing Oswald earlier that day) "On that particular morning there were three or four of us standing by the window, and Oswald came over and said, 'what's everybody looking at, what's everybody excited about?' And so I - we told him we was waiting on the President. So he just snudged up and walked away." (On the shooting) "And then I think about that time, Jarman says 'Somebody's shooting at the President.' And I told Jarman, I said 'I know it is' because I could hear it being above me and I could hear the shots and everything. And I could even now hear the empty cartridge hit the floor I mean after the shots had been fired. And so, after the shots were fired, well all the officers and everyone else seemed to think it came from down the track down by the underpass cause that's where everyone ran over thatta way. But just like I've said, I've been hunting enough to know the sound of a rifle from a backfire or a firecracker, especially this close to me." (When asked how many shots he heard) "Three. I'd say just about like this BOOM...click click...BOOM...click clickBOOM. Something similar to that."

(**10-20-77** HSCA interview) (On seeing Oswald earlier in the day) "Well a few more friends of mine,

we were over by the window, main entrance coming into the building, and we were looking out and he came over and made the statement to us and asked what was everybody excited about because the president was coming to town." (On Oswald's behavior after making out that the president's visit was nothing to get excited about) "he left, and I never did pay him much, no attention." (When asked a bit later if he saw Oswald come in to work) "No...There's one thing I do recall now was when he ask us what was everybody so excited about the president coming to town. Then when he turn around to leave, you know how a kid would do when he's playing cowboys and Indians?...He did like this: 'pow.'" (When asked if he meant that Oswald behaved as if he were a "cowboy firing two guns") "Yes." (On the shooting) "just as the motorcade came around...3 shots was fired...Boom, clack-clack, boom, clack-clack, boom. One at a time. I see the President fall back and do high hand." (When asked if that was in response to the first shot) "No, I didn't think it was the first shot. I can't recall. (When asked if he saw the president react to the first shot) "No, I didn't because I really didn't know who was shooting--who somebody was shooting at. I mean, I heard the shots, but not thinking that, you know, that that was what was happening--that the president had been hit." (When asked from where he thought the shots were being fired) "From right up above me, up on the fifth floor. And I knew the shots had to be on the 6th floor, you know, on top of the roof." (When asked if heard any cartridges fall) "I heard three." (When asked if Jarman had pointed out any debris in his hair) "Yes...I didn't feel it. It was just something that must have been lightly--debris. It wasn't nothing, you know, that I really could feel...I feel like it was coming from either somebody moving around or something that had to cause the debris to fall down in my hair like that." (When asked again from where he thought the shots were being fired) "Well, I myself, I knew all the time that they came from above, why you could just hear it, I mean, you know, you know somebody's up there..." (On the comments of Jarman and Williams, after they ran to the west side) "Well, at one time somebody made a statement that someone was shooting at the president or they thought someone was shooting at the president. And I think I made the statement 'Yes, I know somebody is shooting at him.'" (When asked if he saw the president hit) "Well, I feel like that he had been hit. I mean I feel like this because I only--he went back in some type of way, he did his hand or something, I don't know if he was falling or reaching for it or what, but I felt like that he had been hit there." (11-09-83 AP article found in the Indiana Gazette) "I didn't see the gun barrel but I did see the debris that fell in one of my friend's hair. *I could hear a gun going off above us, and the debris fell each time there was a shot,*" said Norman. *The debris was dust and tiny pieces of concrete broken loose by the concussion of the rifle, he said.* "I sure do see that scene — sometimes pretty regularly. Sometimes I'll be driving down the street and thinking about it," he said. "I can close my eyes and see President Kennedy again. One minute he's smiling and waving and then he's slumped back and wounded." Norman said he never believed a conspiracy was involved in the assassination, but he also never fully believed his coworker —Oswald—was the trigger man. 'I won't say he did it,' Norman said. 'I just won't.'" (7-23-86 testimony in a televised mock trial, On Trial: Lee Harvey Oswald) "Well, I heard a shot when the motorcade came by. The first shot, it made the President slump. Then I heard two more shots." (When asked if he heard a total of three shots) "Yes, sir." (When asked how he could tell the shots came from above) "Yes, sir...Because I could hear the empty hulls--that's what I call them--hit the floor and I could hear the bolt action of the rifle being pushed back and forward." (When asked how many hulls he heard hit the floor) "Three." (When asked by the defense to describe the rhythm of the sounds) "As I recall, the rhythm of the sounds of the shots was Boom! Click, click. Boom! Click, click. Boom! Click, click." (When asked by the defense if he thought there was an armed man directly above him) "I can't say that I thought that." (When asked if he thought there was somebody up there) "I thought there was somebody up there, sir." (1-19-92 interview with Gerald Posner, reported in Case Closed, 1993) "When the first shot came, I heard boom, then click-click, boom, click-click, boom. I could hear the sound of the click. I could hear the sound of the shells hitting the floor. I could hear everything. Three shots. No doubt in my mind." (6-13-93 Interview with PBS Frontline) (On seeing Oswald earlier in the day) "We were looking out towards Elm Street, so he walked up and asked us,

said, "What is everybody looking for? What's everybody waiting on?" So we told him we was waiting on the President to come by. He put his hands in his pocket and laughed and walked away, so I don't know where he went, or if he went upstairs or downstairs or where." (On the sound of the shots) "We was sitting on the fifth floor, directly under the sixth floor windows. The shots came from above and there was a gun and the shots were sounding, "Boom! Click, click. Boom! Click, click. Boom! Click, click." So there was three shots fired right up over us when we were sitting on the fifth floor." (Intriguingly, the transcription of the first part of this Frontline interview, when published in Gus Russo's 1998 book *Live by the Sword*, had a few extra lines.) In Russo's transcription, between Norman's saying Oswald "laughed and walked away" and his saying "I don't know where he went" he says "I thought maybe he's just being happy that morning or something. He was glad the President was coming through. He acted as though he didn't know, but I kind of think he did know." (Russo's transcription of the second part of the interview, in which Norman describes the shots, was also considerably different than the interview shown on TV, and far more expansive.) "At the time of the shooting, James Jarman and myself were on the fifth floor. Somehow he (Bonnie Ray Williams) lost us. But he did come down to find us just before the motorcade came through. So he joined us and we pulled up some cartons, standing in the window waiting on the motorcade. And as the motorcade came by, we started looking and we had a good view. And all of a sudden, we hear something. 'Boom, ack, ack, boom, ack, ack, boom.' I told Jarman, 'I believe somebody's shooting at the President.' And he said, 'Yeah, that certainly sounds like it.' *And then by this time we looked over and there was some debris or dirt or something fell on top of Jarman's head.* And that was three of the shells I heard on the floor. And when the police officer asked about it, we told them about it and they went up there and that is what they found up there on the sixth floor. Three empty cartridge shells up there." (Article by Bill Hendricks in the San Antonio Express News, as found in the **11-20-93** Moscow-Pullman Daily News) "Norman was a 25-year old employee at the Texas School Book Depository when Kennedy was shot to death Nov 22 1963. One of his co-workers was Lee Harvey Oswald, whom police later arrested as a suspect in the killing. Now, 30 years later, Norman is unemployed, although he sells copies of JFK Today, a tabloid-sized newspaper for \$3 a copy to tourists at Dealey Plaza...'I knew him,' Norman said of Oswald--but not well. The two never talked, except to exchange a brief greeting. Norman recalled seeing Oswald shortly before the president's motorcade reached Dealey Plaza. That was on the fifth floor of the depository, Norman noted, adding that he and another worker, James Jarman, were leaning out of a window with a view of Dealey Plaza. 'He walked over to us and asked what we were doing,' Norman said of Oswald. 'We said we were waiting for the president's motorcade. He laughed and walked away.' A few minutes later, Norman said, he heard three shots fired from the sixth floor window directly above the one he was using to view the parade."

Analysis: as Norman's earliest statements indicate he heard three booms but only one or two shells ejected (Williams quoted him as saying "shell"), his words leave open the possibility that only two shots were fired from directly above him. As he testified to two shots—a first one that hit—and a second one that was apparently the last shot, and then back-tracked and said "I couldn't see at all at the time but I know I heard a third shot fired" it certainly seems his memory of this third shot is unclear. As Bonnie Ray Williams initially left out a shot altogether, there's reason to believe Norman barely remembered this same shot. As Norman's earliest statements mention "two additional shots" and "two more shots," without mention of a five second gap between them, and as the Secret Service noted that he'd said they were "spaced closely together", it certainly seems reasonable to assume he initially thought these last two shots were close together. There was so much talking going on amongst the three men on the fifth floor, however, that it's hard to say for sure. What one can say for sure, thanks to Norman's second CBS interview of 9-27-64, is that he agreed with Jarman that people hit the dirt after the second shot. As the Zapruder film and the statements of the eyewitnesses indicate that no one hit the dirt till after the head shot, this indicates he heard a shot after the head shot. Finally, while some use

Norman's latter day statements as proof that all three shots came from above, they fail to mention that Norman said he could only tell that the shots came from above by the sound of the hulls hitting the floor, and that he didn't quantify the number of clicks of the rifle or hulls falling to the floor as three until many years after the shooting. They also fail to reveal that Norman has repeatedly changed his story. Between March and September 1964 Norman changed his story about whether it was he or Jarman who first said the shots came from above. In 1967 he changed it back, only to change it back again in the Frontline interview cited by Russo. Far stranger, Norman testified to a discussion regarding debris on Bonnie Ray Williams' head; he then told the HSCA the debris discussed was on his own head, he then told Frontline it was on James Jarman's head. Far worse, on 11-26-63 Norman denied even seeing Oswald on the 22nd, only to change his story by March 64 and testify that he saw him around 10 O'clock but did not speak to him, only to modify his story yet again and tell CBS, the HSCA, and Frontline that he not only saw him but was with a group of people that spoke to him. Even worse, he told the HSCA that Oswald had simulated a gunfight as he walked off from this group. This is something one would be unlikely to forget. So then why did he tell Frontline that Oswald had put his hands in his pockets at this time? And why did he, in his 1993 interview with Hendricks, indicate he'd spoken to Oswald on the fifth floor shortly before the shots were fired? The constant changes in Norman's story, whether simple misunderstandings or deliberate deceptions, reveal Norman to be unreliable, and thus no witness upon which to build a case.

Which could explain Frontline's editing of his interview... Unless Russo made up the transcript in his book, Norman, with this interview, not only changed his story yet again as to who first said the shots had come from above, but on whose head debris had fallen. More significantly, he changed his description of the shots between takes from "boom ack ack boom ack ack boom" to "boom click click boom click click boom click click." Having the sound end with a "click click," of course, suggests that the sniper ejected a third bullet, and re-chambered a fourth, which fits the single-assassin scenario. (If only two click-clicks were heard, it would be hard to explain how three shots could have been fired, and three bullets found on the floor). One can only wonder, then, if someone "coached" Norman to add this extra click-click back into his story between takes.

Norman's statements to Frontline are intriguing for yet another reason. As there are no edits in between Norman's lines in the first part of the televised interview, and Russo's transcription of the first part of the interview has three sentences between "walked away" and "I don't know," we can assume that either 1) Russo, who'd worked on the program, had access to an alternate take of the interview (as suggested by his widely divergent transcription of the second part of the interview), or 2) Russo invented these lines to help sell his theory that Oswald was eagerly anticipating Kennedy's arrival, so he could kill him. As the second part of the interview as published by Russo is so damaging to Norman's credibility, I believe we should suspect the former. **First shot hit 190-224. Last two shots probably bunched together, with the last shot after the head shot.**

Chapter 9: Piecing It All Together

An analysis of the eyewitness statements, and reasons to suspect that others had reached a similar conclusion

The Witnesses: Final Analysis

Above: an overhead view of Dealey Plaza. The significance of the colored shapes is explained below.

For reasons beyond my grasp, the first image in each chapter sometimes fails to appear. If there's nothing up above, don't despair; you can still see the image [here](#)

The Witnesses: Final Analysis

And now the moment we've been waiting for (at least the moment I've been waiting for)...the results of our eyewitness analysis. With 55 witnesses to the south of Elm Street, 69 witnesses in the motorcade, and 145 assorted witnesses on the railroad bridge, along Elm Street, or in the School Book Depository, we've looked at the words of 269 witnesses to see if they add up to something. Of this **269**, **72** failed to tell us much that would indicate how the shots were fired. Of the remaining 197, **99** made statements suggesting there were three shots fired, with the first shot being heard between Z-190 and Z-224 and the last 2 shots being heard in rapid succession after a short pause. Another **53** made statements suggesting that the first shot was heard between Z-190 and Z-224, but made no statements indicating the last two shots were bunched together. Another **13** heard the last two shots fired closely together, and yet **another** could only swear to hearing two shots, but thought there may have been a third, which was wholly consistent with the last two being fired closely together. This means that 166 of the 197 witnesses described the shots in a relatively consistent manner. Of the remaining 31, **18** heard four or more shots, and another **3** made statements indicating there was a shot after the head shot. This leaves just **10** witnesses whose statements can reasonably be seen as supporting the shooting scenario theorized by John Lattimer, Gerald Posner and Dale Myers. And **8** of these 10, once their

words are compared to the various photographs and films, can be used to argue for a different scenario. This leaves just 2 witnesses who can be used to support the LPM scenario over other scenarios—Mrs. Robert Reid and Geneva Hine—and Reid testified in a manner supporting that the first shot was fired after frame 160. This, then, leaves Hine as the sole unblemished supporter of the scenario, and she didn't even see the impact of the shots. She merely described the shooting in a manner more consistent with a first shot at frame 160 than at 190. That's it. The TV simulations depicting a first shot miss and a five second gap between the second and third shots are therefore incredibly at odds with the available evidence. No matter how many shooters fired on the motorcade, no matter who fired the fatal bullet, the statements of the eyewitnesses indicate THE SHOOTING DID NOT HAPPEN AS PURPORTED BY LATTIMER, POSNER, MYERS, AND NOW, BUGLIOSI.

In defense of the LPM theory, one might venture that those who believed they heard two shots almost on top of each other really heard echoes on the third shot, and simply missed the first shot altogether. But, if this were the case, they should have heard echoes on the second shot as well and concluded there were 4 shots. Moreover, that 24 of the 26 earwitnesses back at Houston and Main who told us anything of value heard the second two shots bunched together is indicative that this is how the shots actually were fired, as Houston and Main was nearly equidistant from the grassy knoll, the Dal-Tex, and the Texas School Book Depository, the possible sniper locations of most frequent speculation. Should one wish to believe that the excitement caused by the shots led these earwitnesses to perceive the shots as having been fired closer together than they really were, one should be reminded that this conclusion directly contradicts all that we know about the effect of stress on human memory. According to Dr. Elizabeth Loftus in her online paper Juror Understanding of Eyewitness Testimony, "People have a strong tendency to overestimate the duration of a stressful event." Attempts to measure this tendency show that people will often interpret the duration of a stressful event as being twice as long as its actual time. As most of the witnesses to Kennedy's assassination were initially unaware that the first loud noise was a shot, for them to say the last two shots were closer together than this first noise and the second shot, is therefore indicative that the last two shots were *extremely* close together. To clarify, as Dr. Loftus' research indicates that the time between these last two shots would most logically have been overestimated, the probability is that, as close together as many witnesses placed these shots, they were *even closer*. And yet this simple piece of information is little understood by the public at large. In a study by Yarmey and Jones quoted online by Dr. Loftus, it was found that 95% of the psychologists and legal experts surveyed understood that witnesses routinely overestimate the lengths of events, while less than 50% of the public shared this understanding.

So what actually did happen? Obviously that's a bit more difficult to demonstrate. In the initial phase of this research, in earlier versions of this presentation, I identified five areas of interest. We shall now examine these five areas in greater detail.

Areas 1 and 2. While roughly 90% of the witnesses heard three shots or less, and less than 10% heard four shots or more, 7 of the 17 motorcade observers nearest the corner of Houston and Elm (the **red** rectangle) said they initially thought they'd heard four shots. When one compares this to the statements of those on the northwest corner of Houston and Main, just a block away (the **blue** rectangle), where better than 25 witnesses said they heard three shots or less, and a big fat zero said four, this raises the possibility some sort of sound-suppressed weapon was fired near Houston and Elm. Since all but one of the 40 witnesses or so inside or directly in front of the Texas School Book Depository, on the west side of Houston, reported hearing three shots or less, the likelihood is that the source of this possible fourth shot was on the east side of Houston, either the Dal-Tex Building or the County Records Building. In accordance with this deduction is that the one witness in front of the Depository to hear more than three shots, James Worrell, was the one closest to the corner. That the Dal-Tex Building, where Jim Braden, a mystery man with a long criminal record and purported mob ties, was arrested after the assassination, is

a likely source for a fourth shot, is especially intriguing. Amazingly, not one witness inside the Dal-Tex Building, and only a handful outside, was interviewed by the FBI. As to why people on the corner of Houston and Elm could hear a silenced shot so much better than others, there could be two factors: one, they were the closest to the Dal-Tex,; and two, they were to the left of bullets fired from the sniper's nest. This meant they heard the muzzle blast as bullets were fired, but not the shock wave as they passed overhead. These two factors would minimumise the difference in volume between a shot fired from the book depository and a suppressed shot fired from the Dal-Tex Building to a greater degree than elsewhere.

Area 3. While many conspiracy theorists believe an extra shot came from the grassy knoll (the **yellow** hexagon), when one looks at the earwitness testimony, one finds that of the 11 witnesses nearest the stockade fence on the north side of Elm, 2 of the witnesses heard only three shots—*the other 9 heard only two!* That one of the three shots heard by others in the plaza was significantly softer than the other two, or that the sounds of the motorcade blocked out the sound of one of the shots is refuted by both the simulations conducted by the HSCA and the fact that those standing at Houston and Main, directly adjacent to the middle of the motorcade and a block away from the shots, almost unanimously heard three shots. To wit, the firing of a Mannlicher-Carcano rifle is reputed to be much louder than even a siren, as decibels are recorded on a similar scale as earthquakes, whereby a ten decibel increase represents a ten-fold increase in power, and a Mannlicher-Carcano was tested at 137 decibels, compared to a loud siren's 120. Adding to this mystery of the two-shot witnesses is that the only witnesses in the Elm Street section of the motorcade to say they heard two shots were in the vicinity of the grassy knoll when the fatal shot arrived. It seems, therefore, that it was the location of these witnesses that somehow prevented from hearing one of the shots.

After spending a day at the library reading books on hearing, I began to understand the scientific principles underlying the possibility of two shots closely spaced together in time but coming from different directions “blurring” into one shot in the minds of those in the middle. As it turns out, the human ear is a far from accurate recording device and has a tendency to “flinch” in self-defense when exposed to sudden loud noise. This “flinching” not only hides other lesser noises beneath the loud noise but it blocks out lesser sounds for up to a fifth of a second (3-4 frames of the Zapruder film) afterwards and can prevent sounds that preceded the loud noise by up to 20 ms (less than one frame) from even being processed by the brain. This phenomenon is written about extensively in books on hearing, and the specialized field of Psychoacoustics, and is known as masking, with simultaneous masking occurring when one sound buries another when the sounds overlap and temporal masking occurring when a louder sound blocks out a preceding or succeeding sound. Significantly, the length of the masking after the end of the noise is proportionate to the length of the original noise, and the degree to which the two sounds share tones. Consequently, a gunshot would be more likely to block out another gunshot than a woman's scream. Furthermore, when one considers that the human brain will automatically fill in short silent spaces between similar tones so that the tones sound like one long sound rather than two shorter bursts, then it becomes clear that those hearing two shots close together would most likely interpret them as one shot. (Indeed, this may explain why the shots “lingered” in the air for some back at Houston and Elm.)

I'm not the first to suspect that shots blurred together. Senator Ralph Yarborough lobbied the HSCA to study this very issue. In his 12-27-78 letter to Chairman Louis Stokes, he wrote: “I have been on hunting trips a number of times when two hunters, neither knowing that the other hunter was firing, fire simultaneously at game, each thinking that they had killed it, each hearing only one explosion. With those experiences in mind, what I recommended to someone of the Committee staff (whom I took from our phone conversation to know nothing about gunfire) was that firing from the Texas School Book Depository window and the grassy knoll be synchronized and be made simultaneously, with proper

listening devices at all proper points, in an effort to see if science, so applied, would throw any light on the doubts which increase with the years, as to the accuracy of the Warren Commission Report. My recommendation may never have gotten past the person on your staff to whom it was given, as that person seemed not to understand it.” While a small fortune was spent studying the acoustical characteristics of Dealey Plaza, the tests outlined by Yarborough were never conducted.

Areas 4 and 5. In my earlier research, I made marks on a copy of a surveyor’s plat of Dealey Plaza. I plotted the origin of the shots as determined by 120 witnesses: 33 witnesses seemed to indicate the TSBD; 21 witnesses seemed to indicate the TSBD, but could also have been referring to the other buildings at Houston and Elm; 44 seemed to indicate an area west of the TSBD, including the grassy knoll; 6 seemed to indicate an area west of the TSBD *or* the TSBD; 10 seemed to indicate shots came from both behind the limousine towards Houston and Elm and in front of the limousine towards the grassy knoll and the railroad bridge; and 6 seemed to indicate neither the area west of the TSBD nor the TSBD itself. I removed some from the list when they either changed their story or gave conflicting stories at the time. There were quite a few surprises. Perhaps the main surprise was that, while much has been made of the fact that so few heard shots from more than one location, there were three men in the Secret Service car behind the President (and virtually equidistant between the TSBD and the knoll area) who heard shots from both behind and in front. This is significant and seems to have been overlooked by most researchers. That there were two additional witnesses who heard shots from both the west and the east standing in the crowd nearby, and that these five witnesses are almost in a line with one another (the **pink** belt) only adds to their credibility (although the two additional witnesses’ credibility on their own is poor). It is especially remarkable since each of these witnesses, without variance, heard the first shot fired from behind the limousine, near the TSBD, and heard the last shot fired from somewhere to the west. Another surprise was that by a decisive score of 13 to 4 more witnesses standing in front of the TSBD (the **green** crescent) thought shots came from somewhere west of the TSBD than from the TSBD. This goes against the argument that those in Dealey Plaza who thought shots came from the knoll were simply confused by “echoes,” as echoes would have been heard with a slight delay and at a substantially lower volume than the shots directly overhead. That virtually every one of these witnesses heard three shots as opposed to four or six is an additional argument against their merely being confused by echoes

When one reads a rarely-cited HSCA analysis of the way gunshots are heard in Dealey Plaza, one can see for oneself that it is indeed fairly easy to distinguish shots from echoes in Dealey Plaza. The writer of this report, Harvard Psychophysics Professor David Green, makes a point of stating that although his hearing was impaired in his left ear, and he was unable to hear the echoes with the clarity of the trained observers, he was nonetheless able to localize the shots based on their initial blast with a similar degree of accuracy as the experts. In the report, the trained observers state that there is a strong echo from the Post Office Annex on the south side of the plaza that comes a second after a shot fired from the TSBD. They said it was readily distinguishable as an echo, but that someone on the knoll hearing this echo might misinterpret the original source of the sound as coming from an area directly behind himself. OK, so that could be an explanation as to why the witnesses on the knoll were incorrect, but what about those in front of the TSBD? Well, the report goes on to say that it would be difficult for someone standing in front of the TSBD to immediately localize a sound high overhead, and that some of the witnesses may have localized on a subsequent echo coming 8/10 of a second later from the area of the overpass “*especially if the rifle had been fired from well within the TSBD.*”

This disclaimer indicates that Dr. Green didn’t really believe his offered explanation, as he knew or should have known that the rifle in the TSBD was seen sticking out the window and that the window was not open sufficiently high enough for someone to fire from back inside the building. Similarly, since the theoretical ability of a lone sniper to shoot accurately from this window is based upon his use

of the boxes stacked in front of the window for support, this statement argues against a lone gunman's ability to shoot 3 accurate shots from the sniper's nest without his giving away his position to a far greater degree than actually occurred. This disclaimer, therefore, can be taken as yet another argument for shots or sounds coming from more than one location, as a lone sniper shooting from the sixth floor window should have been more readily identifiable. Indeed, in his 9-11-78 appearance before the committee, Green made this point abundantly clear.

Early in his testimony, he offered: *"when you are situated immediately under the Texas School Book Depository, which was our general location for the second sequence of shots, two things are rather confusing. First of all, the N wave comes right over your head so you tend to localize the source directly over your head or on occasion you directly localize the source in whatever direction you were facing. You could, for example, move your head into different directions. I once looked down Elm Street in this direction fairly well convinced that the sound came from this direction, and the other observers did likewise, pointed their heads in different directions and said that that influenced their judgments. Also when you are in this location the sound sweeps down the building and the apparent source of the sound is rather large, probably because it scattered off the regular surface of the building. That was caused by the blast wave."* He was then asked if this confusion caused his observers to incorrectly identify the source of any of the shots, and responded *"They certainly made some inaccurate responses. I would say in the order of 10 percent."*

Well, this suggests it really wasn't that confusing. And sure enough, Dr. Green summed up his tests as follows: *"there are certain locations that are best for observing certain shots and in the general region of the book depository, right on the street beneath it, in our opinion it was extremely easy to tell it came from the book. There was a massive sound to the right and rear that sort of crawled down the building, presumably due to scatter on the regular surface of the building and it was quite evident."*

Unstated but implied in Green's report is his knowledge that 11 of the 14 witnesses in this "general region" in front of the depository, including those on its front steps, nevertheless believed the shots came from somewhere else, with 9 pointing west, the direction of the railroad yards and the knoll. Green's attempts to account for this anomaly by suggesting that the rifle was fired from well within the building, as opposed to the more logical possibility that the bullets were undercharged in order to create less noise—which was believed to have been beyond the "lone nut" Oswald's capabilities-- or that the witnesses were simply responding to the last sound they heard, which came from the west, is nevertheless informative, as it indicates a second rifle firing from well within either the Dal-Tex or County Records buildings would not necessarily have been interpreted as coming from those locations, even if the weapon were not equipped with a silencer.

But that is not all the report has to offer. Although, strangely, no rapid fire sequences with shots alternating between the grassy knoll and the TSBD were attempted for the study, the witnesses were able to distinguish isolated shots between the locations with relative ease, with over 85% accuracy, including pistol shots from the knoll and rifle shots from well within the TSBD. When one looks only at the results of the rifle shots fired from the window and any shot fired from the knoll, one sees that the observers correctly identified the source 73 out of 80 times, no matter where they stood in Dealey Plaza. When one looks only at the results gleaned from the observers while they stood near the knoll, one sees they correctly identified the source of the shots 26 out of 26 times, claiming that the un-silenced shots fired were readily identifiable as coming from the stockade fence, which argues against a shot coming from that location, as most the witnesses nearby, including Abraham Zapruder, believed the shots came from somewhere further back. (Why they failed to perform tests using silenced weapons is never explained.) When one looks only at the results gleaned from the observers while they stood on the street in front of the Depository, in addition, it reveals they correctly identified the source 18 of 20 times.

These actual results reveal that the report's musings about people being confused by echoes on the knoll and shock waves in front of the TSBD was so much hooey, offered most likely so that the HSCA would have the option of defending the Warren Commission's conclusions. Instead, the results reveal it's fairly easy to identify the source of a shot fired in Dealey Plaza under normal circumstances. And yet the single-assassin theorists maintain that the 7 out of 9 witnesses between the knoll and the limousine who heard shots from behind them were *wrong*, in a location where the observers were right 26 out of 26 times, and also that the 5 out of 6 witnesses on the North side of Elm who said shots came from the west, were *wrong*, in a location where the observers were right 18 of 20 times. These results indicate that it is the single-assassin theorists who are wrong, yet again. That those convinced of a conspiracy have failed to embrace this report as the convincing argument for a conspiracy that it is can only be explained by their blind reluctance to embrace any evidence or testimony that calls into doubt that the head shot came from the stockade fence.

Extra-Shot Scenarios

Above: Warren Commission Exhibit CE 699, a photograph of Dealey Plaza taken from above. The circled car marks the location of the limousine around Z-224. The colored circles are explained on the subsequent slides.

Extra-Shot Scenarios

Through studying the statements of those claiming to have heard four shots or more, and comparing them to the statements of those who heard three, we can evaluate if there was really a fourth shot fired, and when it was fired. As the bulk of the witnesses heard a first shot between Z-190 and Z-224, followed after a pause by two closely bunched together shots, and as the Zapruder film shows three apparent hits, one on Kennedy circa Z-190, one on Kennedy and Connally circa Z-224, and one on Kennedy at Z-313, we need to ascertain whether or not the fourth shot heard by the four-shot witnesses corresponds to a second shot between Z-190 and Z-224.. If so, then everything makes sense.

Only no such luck. The extra-shot witnesses are all over the map. Consequently, we need to re-evaluate them one by one and see if any sense can be made of them. From west to east across the

plaza...

S.M. Holland observed the motorcade from the railroad bridge. (11-22-63 statement to Dallas County Sheriff's Department, 19H480, 24H212) "the President's car was coming down Elm Street and when they got just about to the Arcade I heard what I thought for the moment was a fire cracker and he slumped over and I looked over toward the arcade and trees and saw a puff of smoke come over from the trees and I heard three more shots after the first one but that was the only puff of smoke I saw... After the first shot the President slumped over and Mrs. Kennedy jumped up and tried to get over in the back seat to him and then the second shot rang out. After the first shot the secret service man raised up in the seat with a machine gun and then dropped back down in the seat. And they immediately sped off." (4-8-64 testimony before the Warren Commission, 6H239-248) "the motorcade was coming down in this fashion, and the President was waving to the people on this side...And she (Jackie) was looking...in the southern direction...And about that time he went over like that(indicating) and put his hand up, and she was still looking off...(he) pulled forward and his hand just stood like that momentarily...His right hand; and that was the first report that I heard...it was a pretty loud report, and the car traveled a few yards, and Governor Connally turned in this fashion, like that (indicating) with his hand out, and another report...And another report rang out and he slumped down in his seat, and about that time Mrs. Kennedy was looking at these girls over here (indicating). The girls standing—now one of them was taking a picture...by the time she could get turned around, he was hit again along in—I'd say along in here (indicating)...It knocked him completely down on the floor. Over, just slumped completely over. I heard a third report and I counted four shots and about the same time all this was happening and in this group of trees...There was a shot, a report, I don't know whether it was a shot...And a puff of smoke came out about 6 or 8 feet above the ground right out from under those trees...you could see that puff of smoke, like someone had thrown a firecracker, or something out...It wasn't as loud as the previous reports or shots." **Analysis:** Holland's testimony conflicts with his initial statement on a number of points. The shot he initially described as the first shot was obviously the head shot. His mentioning of four shots could be an indication he heard two shots around the time of the head shot, and their immediate echoes. By the time of his testimony, he'd obviously been studying Life Magazine and other photographs, and "improving" his memory. **Red circle. Probably heard two shots and echoes.**

Royce Skelton was by Holland on the railroad bridge. (11-22-63 statement to the Dallas County Sheriff's Department, 16H496) "We saw the motorcade come around the corner and I heard something which I thought was fireworks. I saw something hit the pavement at the left rear of the car, then the car got in the right hand lane and I heard two more shots. I heard a woman say "Oh, no" or something and grab a man inside the car. I then heard another shot and saw the bullet hit the pavement. The concrete was knocked to the south away from the car. It hit the pavement in the left or middle lane." (12-18-63 FBI report, CD205 p. 26) "Mr. Skelton noticed that as an open top limousine turned on Elm Street, it had moved approximately one hundred feet at which time he noticed dust spray up from the street in front of the car on the driver's side. This dust spray came from the direction of the Texas School Book Depository building. A few seconds later, he heard what he believed to be three shots." (4-8-64 testimony before the Warren Commission, 6H236-238) "Just about the same time the car straightened out—got around the corner—I heard two shots, but I didn't know at the time they were shots...It sounded like they were right there more or less like motorcycle backfire, but I thought they were these dumbballs that they throw at the cement because I could see the smoke coming up off the cement (when asked how many shots) "I thought I heard four—I mean—I couldn't be sure...after those two shots, and the car came on down closer to the triple underpass, well, there was another shot—two more shots I heard, but one of them—I saw a bullet, or I guess it was a bullet...hit in the left front of the President's car on the cement, and when it did, the smoke carried with it—away from the building." **Analysis:** as with Holland, the first shot or shots heard by Shelton was the head shot. He then thought

he'd heard two shots immediately thereafter, almost certainly echoes, and then a fourth shot after Jackie cried out. By the time he testified, he was no longer sure. **Red circle. Probably heard two shots and echoes.**

Thomas Murphy was a third railroad man claiming to have heard four shots or more. (3-20-64 FBI report, 22H835) "Murphy said they watched President Kennedy's limousine turn down Elm Street past the Texas School Book Depository and start towards them. He stated he then heard what sounded like two shots and he saw President Kennedy and Governor Connally slump in their seats. Murphy said in his opinion that these shots came from just west of the Texas School Book Depository." (5-6-66 interview with Stewart Galanor, transcription on history-matters.com) (When asked how many shots he heard) "More than three." (When asked where the shots came from) "they come from a tree to the left, of my left, which is to the immediate right of the site of the assassination...on the hill up there. There are two or three hackberry and elm trees. And I say it come from there." (When asked if he saw smoke) "Yeah, smoke...in that tree." **Analysis:** as he apparently failed to tell the FBI about hearing "more than three" shots in 1964, it seems Murphy concluded there were "more than three" shots afterwards, perhaps after extensive contact with Holland and Skelton. **Red circle. Probably heard two shots and echoes.**

Toni Foster is believed to be the woman in the Zapruder film running towards Kennedy as his head explodes. (2000 article in the Kennedy Assassination Chronicles) "I heard two firecracker-like sounds and I looked up because it sounded like it was coming from up in the air. At the time, I thought, "Those sound like firecrackers." To me it was click-click; they were just that fast. As I thought that and I looked towards the president I didn't know he was already shot. Because when I did look at him that's when the third shot hit and his head went down like that (puts her head to her chest). I looked at him, I noticed he took his hands and did like this (brings her hands up and crossed at her chest), his head came down. I thought, "I wonder what he's doing? Why did he do that?" As I'm thinking that—that fast—the 4th shot, the last shot, hit and his head exploded. So to me it was four shots. I do recall after that, the shell, I could hear that clink. And I remember everything stopped for me. I remember (his head) looked like confetti, it was just blown off. It hit him back here (puts her hand on the right rear of her head) and it was just like confetti. The spray went behind him. I do believe from what I heard and what I saw the shots came from the back. Now this whole thing was a shock but that's how I feel, what I heard and what I saw—they were coming from the back." **Analysis:** despite her only coming forward in recent years, Foster's account is fairly credible, but not indicative of four shots. While many described the first shot as sounding like a firecracker, Foster is one of the few to conclude it was two separate shots. Her claiming the neck shot was the third shot, when virtually no one else heard this shot, makes some sense when one considers that she was running right towards Kennedy and could see his and Connally's responses to this shot. Her statement that she was wondering what he was doing after this shot is consistent as well with her continuing to run towards Kennedy until the moment of the head shot. As she immediately turns and starts running away, moreover, it also makes sense that she might have missed the last shot heard by so many others. **Green circle. Earliest recorded statements came years after the shooting. Not entirely credible.**

Jean Hill is the woman in red in the Zapruder film. She stood right in the middle of the plaza with her friend, Mary Moorman. (11-22-63 WBAP interview, quoted in Pictures of the Pain) "the shots came directly across the street from us, and just as the President's car became directly even with us...he and Jackie were looking at a dog that was in the middle of the seat, and about that time two shots rang out just as he looked up—just as the President looked up and these three shots rang out and he grabbed his chest, looked like he was in pain, and fell over in his seat. And Jackie fell over him and said "My God, he's been shot!" After that more shots rang out and the car sped away." (11-22-63 WBAP interview, quoted in Pictures of the Pain) "Mary started to take the picture and the President came right even with

us, two shot, we looked at him and he was looking at a dog in the middle of the seat—two shots rang out...And there was an interval and then three or four more shots...” (11-22-63 KRLD interview, transcribed by David Lifton and posted online by Jack White, 2-16-07) “we were both looking at the President. We were looking at his face. As Mary took the picture, I was looking at him. And he grabbed his hands across his chest when two shots rang out. He grabbed his hands across his chest. I have never seen anyone killed, or in pain before like that but there was this odd look came across his face, and he pitched forward onto Jackie’s lap. And, uh, she immediately, we were close enough to even hear her, and everything, and she fell across him and says, “My God, he’s been shot”...The motorcade was stunned after the first two shots, and it came to a momentary halt, and about that time 4 more uh, 3 to 4 more shots again rang out, and I guess it just didn’t register with me. Mary was, huh, had gotten down on the ground and was pulling at my leg, saying “Get, get down, they’re shooting, get down, they’re shooting, and I didn’t even realize it. And I just kept sitting there looking...After they were momentarily stopped—after the first two shots—then they sped away real quickly.” (11-22-63 WFAA interview, quoted in Pictures of the Pain) “just as the car came right in line with us, the President looked up and just as he looked up two shots rang out and he grabbed his chest and this real odd look came over his face and he pitched forward onto her lap...the motorcade momentarily halted and three or four more shots rang out and they sped away real quickly.” (11-22-63 statement to Dallas Sheriff’s Department, 19H479, 24H212) “The President’s car came around the corner and it was over on our side of the street. Just as Mary Moorman started to take a picture we were looking at the President and Jackie in the back seat... looking at a little dog between them. Just as the President looked up toward us two shots rang out and I saw the President grab his chest and fall forward across Jackie’s lap and she fell across his back and said “My God, he has been shot”. There was an instant pause between the first two shots and the motorcade seemingly halted for a second and three or four more shots rang out and the motorcade sped away.” (Interview in Rush to Judgment, filmed 2-18-64) “the consensus of opinion...down there at the quarters was that there had been only three shots...they kept sayin’, are you sure it wasn’t echoes?” (3-18-64 FBI report, 25H853) “She stated that President Kennedy was looking down when she shouted and when he turned to look at her a shot rang out and he slumped towards Mrs. Kennedy... Mrs Hill heard more shots ring out and saw the hair on the back of President Kennedy’s head fly up...she heard from four to six shots in all and believes they came from a spot just west of the Texas School Book Depository. She thought there was slight interval between the first three shots and the remaining shots.” (3-24-64 testimony before the Warren Commission, 6H205-223) “We were standing on the curb and I jumped to the edge of the street and yelled “Hey, we want to take your picture” to him and he was looking down in the seat—he and Mrs. Kennedy and their heads were turned toward the middle of the car looking down at something in the seat, which later turned out to be roses...as I yelled “Hey” to him, he started to bring his head up to look at me and just as he did the shots rang out. Mary took the picture and fell on the ground and of course there were more shots... I have always said there were some four to six shots. There were three shots, one right after the other, and a distinct pause, or just a moment’s pause, and then I heard more.” **Analysis:** Hill failed to hear any shots before witnessing the head shot. She then heard the same last two shots bunched together heard by others, and then a series of echoes. There’s little reason to accept her contention there were two or three more shots fired after the head shot, when Hudson, Summers, and Brehm all heard but one. Unlike Hill, they’d at least heard the first shot. **Red circle. Probably heard two shots and echoes.**

Beverly Oliver claims to be the woman standing behind Charles Brehm and his son in the Zapruder film. People often refer to this woman as the Babushka Lady. (The Men Who Killed Kennedy, broadcast 1988) “When I first heard a noise I was not aware that that was a shot being fired. And maybe perhaps that’s why I continued to film because I thought it was a backfire or a firecracker. I mean I wasn’t used to being around guns. I did not realize that those were shots until I saw in the frame of my camera President Kennedy’s head come off, the back of his head. Then I realized that that

was a shot. I don't know how many I heard. I know where I thought the shots came from. It was the picket fence area, around that large tree, somewhere on the other side of those steps but in the picket fence area. There was a figure there and there was smoke there. I will always believe that the man who shot President Kennedy was standing somewhere in the picket fence area and no one will convince me any differently." (From her **1996** book *Nightmare in Dallas*) "Beverly heard a pop, pop sound coming from the direction she faced....How rude that some parents would let their kids throw sidewalk poppers near the President, she thought. Then she heard another pop. Hold steady. The car was moving about twelve miles an hour as it passed directly in front of her. It then seemed to come to a stop. She continued filming wishing President Kennedy would turn around, then a loud, boom-boom sounded, and the President's head was violently thrown backward as a spray of crimson blood spouted from the back of his head..." "Oh, my God...he's been shot." ...Beverly smelled something acid in the air. It didn't smell right. A cloud of smoke drifted up from behind the fence and dissipated as it blew across the lawn." **Green circle: earliest recorded statements came years after the shots. Not entirely credible."**

William Greer was the driver of the limousine. (**11-28-63** report, 18H 723) "The President's automobile was almost past this building and I was looking at the overpass that we were about to pass under in case someone was on top of it, when I heard what I thought was the backfire of a motorcycle behind the President's automobile. After the second shot, I glanced over my right shoulder and saw Governor Connally start to fall, I knew then that something was wrong and immediately pushed the accelerator to the floor and Mr. Kellerman said get out of here." (**12-10-63** FBI report, CD7 p.3-11) "He advised that the throngs of people were great and that he had just emerged from the congested area of people and was proceeding into an open area of the highway, which a short distance away passed beneath an overpass. Greer stated that he first heard what he thought was possibly a motorcycle backfire and glanced around and noticed that the President had evidently been hit. He thereafter got on the radio and communicated with the other vehicles." (**3-9-64** testimony before the Warren Commission, 2H112-132) (When asked how far they were from the overpass when the first shot rang out) "I wouldn't have a distance recollection at all on how far it was. It wasn't too far... Well, when we were going down Elm Street, I heard a noise that I thought was a backfire of one of the motorcycle policemen. And I didn't--it did not affect me like anything else. I just thought that it is what it was... And then I heard it again. And I glanced over my shoulder. And I saw Governor Connally like he was starting to fall. Then I realized there was something wrong. I tramped on the accelerator, and at the same time Mr. Kellerman said to me, "Get out of here fast." And I cannot remember even the other shots or noises that was. I cannot quite remember any more. I did not see anything happen behind me any more, because I was occupied with getting away." (When asked how many shots he heard) "I know there was three that I heard - three. But I cannot remember any more than probably three. I know there was three anyway that I heard... I knew that after I heard the second one, that is when I looked over my shoulder, and I was conscious that there was something wrong, because that is when I saw Governor Connally. And when I turned around again, to the best of my recollection there was another one, right immediately after." (When asked how much time elapsed between the first and second shots.) "It seems a matter of seconds, I really couldn't say. Three or four seconds." (When asked how much time elapsed between the second and third shots.) "The last two seemed to be just simultaneously, one behind the other, but I don't recollect just how much, how many seconds were between the two. I couldn't really say." **Analysis:** Greer would only say he heard 3 shots, but if he turned around after the second shot, and heard another after he turned back around, and heard the last two simultaneously, there's no escaping that he heard four shots. The only reasonable explanation is that he meant to say "successively" or some other term instead of "simultaneously." **Blue circle. Possibly heard 4 shots but would only admit to hearing 3 shots.**

A.J. Millican (**11-22-63**, 19H486) "I was standing on the North side of Elm Street, about half way

between Houston and the Underpass... Just after the President's car passed, I heard three shots come from up toward Houston and Elm right by the Book Depository Building, and then I immediately heard two more shots come from the Arcade between the Book Store and the Underpass, and then three more shots came from the same direction only sounded further back... Then everybody started running up the hill. A man standing on the South side of Elm Street was either hit in the foot or the ankle and fell down..." **Analysis:** Heard way more shots than any other human. **Purple circle. Obviously confused by echoes.**

J.C. Price watched the motorcade from the roof of the Terminal Annex Building. (11-22-63 statement to the Dallas County Sheriff's Department) "The cars had proceeded west on Elm and was just a short distance from the triple underpass, when I saw Gov. Connally slump over. I did not see the President as his car had gotten out of my view under the underpass. There was a volley of shots, I think five and then much later, maybe as much as five minutes later another one. I saw one man run towards the passenger cars on the railroad siding after the volley of shots.... He had something in his hand. I couldn't be sure but it may have been a head piece." (Interview in Rush to Judgment, filmed 3-27-66) (When asked where the shots came from) "From behind the overpass over there, triple overpass, that's where I thought the shots were coming from." (When asked where he saw the man run) "Over behind that wooden fence past the cars and over behind the Texas Depository Building." (When asked to mark a map showing where he thought the shots came from, and then asked if he has marked the map "just behind the wooden fence where it joins the overpass.") "That is correct." **Analysis:** Price's belief that there was a sixth shot fired so long after the others should cause one to doubt he heard the other five accurately. **Purple circle. Obviously confused by echoes.**

Rosemary Willis is the little girl seen running in the Zapruder film, as discussed on the Finding the Right Time slide. (11-13-78 HSCA staff interview, summarized in HSCA Report, vol. 12, p.7) "Ms. Willis said she was aware of three shots being fired. She gave no information on the direction or location of the shots, but stated that her father became upset when the policeman in the area appeared to run away from where he thought the shots came from; that is, they were running away from the grassy knoll." (6-5-79 UPI article) "I heard three shots and they all came from across the street from the direction of the book depository... The sounds I heard came from the book depository but they weren't necessarily the shots that killed him. Someone with a gun with a silencer could have been in the gutter where they later found shells or on the railroad trestle or behind the wall." (6-5-79 article in the L.A. Times, as cited in Pictures of the Pain, p. 171) (She had stopped running) "when I heard the first shot." (Interview with Texas Monthly, published November, 1998) "As they made the turn from Houston to Elm Street, they'd just gone a few feet when the first shot rang out, and upon hearing the sound, my normal body reaction was to look up and follow the sound that I heard... And the pigeons immediately ascended off that roof of the school book depository building and that's what caught my eye... Next thing I know, right after that, there's another shot. And after that, there's another shot and another shot... My ears heard four shots... I really think that there were six, but I heard four and I'll tell you why... the first shot rang out. It was to the front of me, and to the right of me, up high. The second shot that I heard came across my right shoulder. By that time, the limousine had already moved further down. And that shot came across my shoulder. And the next one, right after that, still came from the right but not from as far back, it was up some. Still behind me, but not as far back as the other one. And the next one that came was from the grassy knoll and I saw the smoke coming through the trees, into the air... Fragments of his head ascended into the air, and from my vision, focal point, the smoke and fragments, you know, everything met." **Analysis:** it's a shame Miss Willis was never interviewed when her memories were fresh. In 1979, she said she heard three shots from the right, and in 1998 she said she heard three shots from the right, and then one from in front of the limousine. As a result her credibility is questionable. **Yellow circle. Probably heard three shots and convinced herself she heard four. Not entirely credible.**

Amos Euins sat on the fountain wall by Houston and Elm. (11-22-63 statement to Dallas Sheriff's Department, 16H963, 19H474) "I saw the President turn the corner in front of me and I waived at him and he waived back. I watched the car on down the street and about the time the car got near the black and white sign I heard a shot. I started looking around and then I looked up in the red brick building. I saw a man in the window with a gun and I saw him shoot twice...I could tell the gun was a rifle and it sounded like an automatic rifle the way he was shooting. This was a white man, he did not have on a hat. I just saw this man for a few seconds." (12-23-63 FBI report, CD205 p.i) "Amos Lee Euins, age 14, states saw white man...in window...with rifle after first shot and observed this man fire second and third shots and what he believes may have been a fourth shot." (3-10-64 testimony before the Warren Commission, 2H201-210) 'then when the first shot was fired, I started looking around, thinking it was backfire. Everybody else started looking round. Then I looked up at the window, and he shot again...I got behind this little fountain, and then he shot again. (when asked how many shots he heard) "I believe there was four to be exact...After he shot the first two times, I was just standing back here. And then after he shot again, he pulled the gun back in the window. And then all the police ran back over here in the track vicinity....The first shot I was standing here...And as I looked up there, you know, he fired another shot, you know, as I was looking. So I got behind this fountain thing right in there, at this point B...I got behind there. And then I watched, he did fire again. Then he started looking down towards my way, and then he fired again." **Analysis:** Euins is a credible witness. Although he initially said he only saw the sniper fire twice, his discussion of automatic weapons indicates that one of the times he saw the sniper fire, he heard two shots ring out. This most logically means that Euins heard two shots around the time of the head shot. Sure enough, his description of these last two shots indicates only a short interval between the shots. **Light blue circle. Credible witness.**

Ronald Fischer was on Houston along the same fountain wall as Euins. (11-22-63 statement to the Dallas County Sheriff's Department, 19H475, 19H650) "by that time the motorcade rounded the corner. And then I heard what I thought was three shots, and the motorcade was about where the Stemmons Freeway sign is there." (12-2-63 FBI report, CD205 p.19-20) "Shortly after the President's car had passed his position, he heard several shots, evenly spaced, with what he thought three or four seconds between each shot. He thought first shot was firecracker." (4-1-64 testimony before the Warren Commission, 6H191-200) "Well the motorcade—the limousine made the wide turn and—they went out of our view just as they began to straighten up onto Elm Street...I started watching the other cars...as I looked around to watch these other cars, I heard a shot. At first I thought it was a firecracker. And—uh—everybody got quiet. There was no yelling or shouting or anything. Everything seemed to get real still. And—uh—the second shot rang out, and then everybody, from where I was standing, everybody started to scatter. And—uh—then the third shot. At first I thought there were four, but as I think about it more, there must have been just three...They appeared to be coming from just west of the School Book Depository. There were some railroad tracks and there were some railroad cars back in there." (7-9-98 video-taped interview posted on Youtube) "I originally said in my deposition in the Sheriff's office that there were four shots. And there were a number of people who had claimed that they heard four shots. However, I began to question that because I just simply could not remember exactly how many shots there were. It's like trying to remember if it was eight or nine--y'know it's a little easier with three or four--but becomes more difficult with eight or nine and still more difficult with nineteen or twenty. I don't know if there were three or four shots. I thought there was four and I had explained that to the investigator, Mr. Belin. I still think that there were probably four shots but I couldn't swear to it." **Analysis:** Fischer admittedly talked himself out of thinking there were four shots. He then talked himself back into thinking it again. That he even thought for a moment there were four shots says something, particularly as he was standing near Euins and Edwards. **White circle. Talked himself out of hearing four shots.**

Robert Edwards was with Fischer. (11-22-63 statement to the Dallas County Sheriff's Department,

19H 473, 19H647) "The motorcade rounded the corner at this time, and I thought I heard four shots, but it never occurred to us what it was. The shots seemed to come from that building there." (12-2-63 FBI report, CD205 p.21-22) "Shortly after President Kennedy's car passed his position, he heard shots, which he thought were three or four in very rapid sequence." (4-1-64 testimony before the Warren Commission, 6H200-205) (When asked how many shots he heard) "I heard one more than was fired, I believe...I still right now don't know how many was fired. If I said four, then I thought I heard four. (When asked if he knew where the shots came from) "I have no idea" (When asked if he'd said the shots came from the building) "No, I didn't say that." **Analysis:** Edwards, to his credit, stuck to his impression that he'd heard four shots. Too bad he never told us how these shots sounded. **Light blue circle. Credible witness.**

James Worrell (11-23-63 affidavit to Dallas County) "I was standing on the sidewalk against a building on the corner of Elm and Houston Streets watching the motorcade of the President. I heard loud noise like a fire cracker or gun shots. I looked around to see where the noise came from. I looked up and saw the barrel of a rifle sticking out of a window...While I was looking at the gun it was fired again. I looked back at Mr. Kennedy and he was slumping over. I got scared and ran from that location. While I was running I heard the gun fire two more times. I ran from Elm Street to Pacific Street on Houston. When I was about 100 yards from the building I stopped to get my breath and looked back at the building. I saw a w/m, 5'8" to 5'10", dark hair, average weight for height, dark shirt or jacket open down front, no hat, didn't have anything in his hands, come out of the building and run in the opposite direction." (3-10-64 testimony before the Warren Commission, 2H190-201) "as they went by me, they got, oh at least another 50, 75 feet on past me, and then I heard the shots...I looked up and saw the rifle...I looked to see where he was aiming and after the second shot and I have seen the President slumping down in the seat...I looked up again and turned around and started running and saw it fire a third time...I did it all in one motion, I looked up, turned around, and ran, pivoted...everybody was screaming and saying "duck"...Just as I got to the corner I heard the fourth shot...they were right in succession...I turned the corner, went right down beside the building on the sidewalk and when I got to the corner...Of this building (The Texas School Book Depository) (I) "Cut directly across, kind of at an angle...I rested there...approximately three minutes before I saw this man come out the back door." (When asked to estimate the time span of the shots) "best estimate 5, 6 seconds" (When asked how he knew the rifle fired the second shot) "I saw what you might call a little flame and smoke." (When asked about the third shot) "Same thing, a little flash of fire, and then smoke."

Analysis: Worrell's recollection of seeing fire and smoke come from the barrel of the gun is unique and probably a by-product of an over-active imagination. If smoke were pouring from the gun, it should have been apparent to Harold Norman, who was only feet below this barrel. Beyond this, Worrell is credible. As Euins, he may have merely seen the rifle and assumed it fired the second shot. His description of the last two shots indicates they were close together. **Light blue circle. Credible witness.**

Mrs. Carolyn Walther (12-5-63 FBI report, 22H522) (She was standing) "on the east side of Houston Street, about fifty or sixty feet south of the south curb of Elm Street...As soon as the President's car passed where she was standing, she and Mrs. Springer turned away and started walking north toward Elm Street. At about the time they reached the curb at Elm Street, she heard a loud report and thought it was fireworks. There was a pause after this first report, then a second and third report almost at the same time, and then a pause followed by one and possibly more reports." (Late 1966 interview with Lawrence Schiller recounted in *The Scavengers and Critics of the Warren Report*, published 1967) "I heard one shot, and I thought at the time the first shot was a firecracker, and after the last car passed me I started walking back to work, and I had reached the curb, and two more shots, and then a second--two seconds later, one more. It wasn't as loud as the others. But the second and third shots were right together, and then I thought 'Oh, it's gunshots'.....I definitely feel that I heard four shots." (Interview

with CBS broadcast **6-25-67**) "The President passed us, and he was smiling, and everybody was waving. Then the last of the cars went by, and I heard the shot. I thought it was a firecracker. Then I started back to work, and it was along the curb, and then two shots right together, and then another one. I'm sure there were four shots." (2-14-69 testimony in the trial of Clay Shaw) (When asked how many shots she heard "All together I heard four" (When asked what the first one sounded like) "It was a loud popping sound and I thought it was just a firecracker...the last car was passing in front of me when I heard the first shot...The second one I was just stepping off the curb. " (And the third?) "Almost to the center of the street." (And fourth?) "In the center of the street." (And how did they sound? The second?) "It sounded just like the first one." (The third?) "The same" (And fourth?) "A little lower...I stopped and said "That is gunshots." **Analysis:** Mrs. Walther's placement of the two bunched shots in the middle is problematic. Her companion, Mrs. Pearl Stringer, heard only 3 shots, and said that shots 2 and 3 rang out together; this would seem to indicate that the extra shot heard by Walther was an extra shot at the end. This would seem to be in opposition to the eyewitness evidence taken as a whole, which suggests two shots--one hitting Kennedy and one hitting Connally--were fired during a period the bulk of the witnesses heard but one shot fired. Nevertheless, Walther's statement that the last shot sounded different matches the statements of Rosemary Willis. **Light blue circle. Credible witness.**

Mrs. Ruby Henderson (12-6-63 FBI report, 24H524) "She was standing on the east side of Elm Street just north of Houston Street (they must mean the east side of Houston just north of Elm)...at the time the motorcade passed where she was standing, she heard what she initially thought was a firecracker, and saw what she thought was paper fly out of the Presidential car. She said she now realized it was a shot she heard and what she thought was paper was probably flesh. She said after the first shot, she believes she heard two more in rapid succession, and then a fourth shot." **Analysis:** it's strange that Mrs. Henderson described the shots in the same idiosyncratic manner as Mrs. Walther. Once again, the extra shot appears to have been an extra shot after the head shot. One possible explanation for this joint recollection of the shots is that, by the time, they talked with the FBI, the two women had talked to one another. Since they both worked in the Dal-Tex Building this appears possible. **Light blue circle. Credible witness.**

Mike Brownlow is a long-time assassination researcher and a regular presence in Dealey Plaza. He claims also to have been a witness. In **November 2004, and again in 2005**, I talked with him in Dealey Plaza and asked him where he was when the shots rang out. Both times he told me he was standing in front of the Dal-Tex Building on the northeast corner of Houston and Elm with his grandmother. Both times he said he heard four shots, but could not tell where they came from. (**12-6-11** article by Jay Gibbs on researcher Bruce Engelman, found on the Starlocalnews.com website) "Engelman, who has worked for several national news organizations, including ABC, has a national sports talk show that he records every Tuesday night. Last Tuesday, however, he had a special guest in his recording studio -- Mike Brownlow of Dallas. Brownlow was a 13-year-old kid who was near the Grassy Knoll in Dallas when JFK was shot. "I heard one shot and then, immediately after that, I heard a second shot," Brownlow said. "Then, after that, I heard several shots in succession -- POP! POP! POP! Then, in a matter of five or six seconds, it was all over. The shooting had stopped. And I definitely think that the last shot I heard came from the Grassy Knoll." **Analysis: Green circle. Earliest recorded statements came years after the shooting. Not entirely credible.**

John Hoefen, an NBC sound technician, sat in the middle of the front seat of the first of three Chevrolet convertibles approaching Houston and Elm at the time of the first shot. (**11-22-63** phoned-in report broadcast on NBC radio--WBAP in Dallas--at approximately 1:50) "We were just leaving the business district of Dallas when this shooting took place...We were making a sweeping curve here on a roadway approaching a freeway when the first shot rang out. Our first reaction was that some teenager had fired a cherry-bomb. When the second one rang out, we sort of felt that there was something wrong

up there. People started to drop down to the ground ahead of us, roughly 50 to 60 feet up near the President's car. Then there was a third and if I remember correctly a fourth shot. Immediately, after that last shot the President's car took off in a tremendous burst of speed followed by the Secret Service follow-up car..." (11-22-63 phoned-in report broadcast on NBC television, at approximately 2:00 PM) "We were approaching a drive which would put us on a freeway, where we would then drive to the Trade Mart...As we turned down this moderate curve here there was a loud shot. At first we thought it was a cherry bomb by some teenager. Then it was immediately followed by two or three more. Everybody said "duck" then there were people falling to the ground. We did not know who was shot. Ladies and men both were screaming..." **Analysis:** in his initial interview, Hoefen said there was "If I remember correctly a fourth shot." This suggests his initial impression was that there was indeed four shots, but that he'd started doubting his impression after coming in contact with others. One can only wonder, then, how many others thought they'd heard four shots but who stopped claiming as much as soon as the news media started trumpeting there were three. It should also be noted, however, that Hoefen thought people fell to the ground after the second shot--and that this would almost certainly have been the head shot. As very few heard more than one shot after the head shot, well, it seems possible Hoefen was yet another witness confused by the final echoes. **Light blue circle. Credible witness.**

Henry Burroughs was in the Chevy behind Hoefen. (Pictures of the Pain p.398, based on Trask interview 8-21-85) "Burroughs remembers hearing four shots..." "We came up to the scene of the shooting and people were running all over the place." (10-14-98 letter to Vince Palamara quoted in JFK: The Medical Evidence Reference) "After the President's limousine turned the corner at the book depository we could not see him, but we heard the shots, and the motorcade stopped." **Analysis:** it is interesting indeed that the one member of the motorcade besides Hoefen to say he heard four shots just so happened to be in the car right behind Hoefen and approaching Houston and Elm around Z-224. It's also interesting that one of the few to have claimed he heard two shots before Z-270 or so, Dave Wiegman, was in the car just in front of him, with Hoefen. **Green circle. Earliest recorded statements came years after the shooting. Not entirely credible.**

Robert West (2-13-69 testimony in the trial of Clay Shaw)(When asked if he'd heard anything unusual after the limousine turned down Elm Street) "Some time after it turned on Elm Street what sounded to me at that time as what I thought was backfiring, a motorcycle." (When asked how many backfires he heard) "Four". (When asked if these backfires sounded the same) "Yes". (When asked what the first "backfire" sounded like) "A motorcycle backfired." (When asked what the second and subsequent "backfire" sounded like) "A rifle fired...It appeared to me it was rifle fire after the second. The first and the second my response was it was motorcycle backfire." (When asked again to describe the third sound) "Rifle fire." (When asked if these were loud sounds) "Yes, sir." (When asked from where he thought this sounds were coming) "The sound came from the northwest quadrant of Dealey Plaza...This entire area north and west of Elm Street." **Analysis:** West was the Dallas County Surveyor. Since the Secret Service, FBI, and Warren Commission all used his services to make plats of Dealey Plaza, and since they all came to different conclusions, and kept changing the locations for the shots, it only makes sense that he would grow suspicious of the official story, and suspect there'd been more than 3 shots. **Green circle. Earliest recorded statements came years after the shooting. Not entirely credible.**

This review of the statements of the preceding witnesses demonstrates quite convincingly that the four sounds heard by these witnesses were not the same sounds. While there are a number of credible witnesses near Houston and Elm, the statements by Walther and Henderson are not only in conflict with our analysis of the Zapruder film, which indicates the fourth shot unheard by those hearing three shots was the shot impacting at Z-224, but also the statements of Willis, Euins, and Worrell. As the other

witnesses in the area—Fischer, Edwards, Burroughs, and Brownlow, told us very little beyond that they'd initially believed they'd heard four shots, we are prevented from using the statements of the Houston and Elm witnesses to come to a concrete conclusion. Still, the strange circumstance that so many witnesses heard an extra shot in one of the easiest locations to tell echoes from shots is noteworthy, and should not be overlooked. It should also be noted that the likely origin for the extra shot heard by the credible four shot witnesses just so happened to be the building with the best vantage point for a sniper, the Dal-Tex Building. One might reasonably suspect this was more than a coincidence.

Sniper's Nest Views

At right: Warren Commission Exhibit 724, the view from the sniper's nest. The added red stars at right and below signify the approximate positions of the President at Zapruder frames 160, 190, 224, and 313. The blue star marks the location of James Tague.

Below: a crop of Warren Commission Exhibit CE 879, the view from the top of the Dal-Tex Building on an FBI Model of Dealey Plaza. Note that the cars are moving directly away.

At left: Warren Commission Exhibit 882, a survey of Dealey Plaza, with stars added as on CE 724. Green mark represents Thornton Freeway sign. Targets represent sniper's nests in CE 724 and CE 879.

Sniper's Nest Views

When one looks at photographs taken from the sniper's nest and compares them with photographs taken from the Dal-Tex Building one can see the advantages of the Dal-Tex Building as a location for a shooter. While a sniper from the nest would have to pan as he shot at the motorcade, a sniper from the Dal-Tex would barely have to change his aim. According to snipers trained in the U.S. Special Forces, having the time to aim before firing and being to able to re-fire without re-aiming is more desirable than being right on top of a target. Sniper tactics first popularized by legendary WW I sniper Herbert McBride, moreover, dictate that shooting across an obstacle, such as a tree or a creek, or in this case an open window in the sixth floor of the school depository, will cause those in the target area to focus their attention on the obstacle closest to them. It follows then that the Dal-Tex Building was the ideal

location in Dealey Plaza for a shooting on Elm. Despite the current speculation that a shot came from the second floor, a more vertical location would have been preferable, because from such a perch one could zero in on Kennedy without having to shoot through the Secret Service Agents standing on the side of the follow-up car.

The FBI, apparently, reached this same conclusion. While testifying for Arlen Specter before the Warren Commission, FBI Exhibits Chief Leo Gauthier brought along some photos of a scale model he'd created of Dealey Plaza. He testified that exhibit 879 represented "a view of the scale model looking toward the southwest, in the direction of the triple underpass, *from a position on the sixth floor in the southeast corner window.*" While this implies the photo depicts the view from the sniper's nest, a quick look at the view reveals that it is in fact a view from the upper floors, or roof, of the Dal-Tex Building, across the street from the depository. Gauthier, a 29-year-veteran of the Bureau, who had created hundreds of crime-scene models as visual aids for trials, was almost certainly aware of the inaccuracy of his statement. Months before Gauthier's testimony, the FBI had supplied the Commission with a collection of visual aids created by Gauthier. The photo was misrepresented at that time as well.

When one looks at an actual view from the sniper's nest, exhibit 724, and compares it with the surveyor's plat of Dealey Plaza used by Gauthier (which strangely excludes the Dal-Tex Building), and marks the position of the limo at the various frames of the Zapruder film, one can find even more reason to mistrust the "official" story, and yet another reason to reject the LPM scenario.

To refresh, the LPM scenario--the shooting scenario pushed by Dr. John Lattimer, Gerald Posner, Dale Myers, and sometimes Vincent Bugliosi, and the shooting scenario the mainstream media pretends is the official government scenario--holds that the first shot rang out around frame 160 of the Zapruder film. As we've learned from reading the eyewitness statements, this is silly.

When one compares exhibit 724 with the plaza plat, however, one can see that it is more than silly; it is ludicrous.

First, one can see that the Thornton Freeway sign, where witness after witness placed the limo at the time of the first shot, was a good thirty feet past where the LPM scenario places the car when the first shot rang out. Second, when one notes the location of wounded bystander James Tague on the plat, and reflects that the LPM scenario holds that Tague was wounded when the lead core of the FIRST bullet fired hit a nearby curb after striking a twig, one can't help but scratch one's head. It simply makes no sense that a high-speed bullet fired from a position 60 feet up and 120 feet behind could hit a twig 30 feet off the ground, break up, and be deflected four hundred feet forward and to the right, particularly, when this same kind of bullet, with the very next shot, is purported to have slashed through a man's torso, hit another man in the armpit, smashed out inches of his ribcage, crashed through his wrist and lodged itself in his thigh, with little apparent damage to the bullet. It's doubtful a shot at frame 160 would even strike a twig.

Now, it's not as if I readily throw out EVERY idea presented by the single-assassin theorists. Ironically, I suspect two other prominent single-assassin theorists, Kenneth Rahn and Larry Sturdivan, have solved the mystery of Tague's wound. Since Rahn is so terribly Rahng in his defense of Dr. Vincent Guinn's Neutron Activation Analysis (see chapter 11), I wasn't prepared for it, but I now believe he's been successful in demonstrating that the fragment which kicked up the concrete near Tague, and cut up Tague's cheek, could have come from the bullet striking Kennedy on the top of his head. A quick look at the plat above shows how they are almost in line. When one projects this location back to the car at 313, moreover, one can see that the trajectory of the fragment passes only inches above and to the right of the trajectory of the nose of the bullet, which hit the windshield, and the trajectory of the tail of the bullet, which hit the window frame. While the Tague fragment also aligns with a missed shot from

the Dal-Tex, the FBI inspection of the scar on the curb near Tague revealed only lead, and no copper, which would indicate this mark was created by a fragment, without a copper jacket. When one recalls that the base of a bullet found in the limousine was completely empty of its lead and that almost half the bullet was never found, moreover, a conclusion that the lead came from this bullet seems perfectly reasonable. Since Sturdivan's calculations show that a fragment would have had enough energy to continue on and strike the curb near Tague, Rahn's conclusion seems more than reasonable; it seems probable.

But don't worry, this does little to convince me there was only one shooter, and that the shooter in the depository was Oswald.

Views on the Sniper

Beyond the reasons already discussed, there are purely technical reasons to doubt Oswald was one among any number of shooters. The sniper's nest shooter was in a very cramped space, rapid firing on a target moving left to right, and was purported to have taken these shots while sitting on a box, using a gun rest. There are reasons to believe a man with Oswald's limited training would not only not be able to pull this off, but would not even attempt to fire shots in this manner. Consider:

- Although Oswald's shooting scores while in the Marines were adequate at the beginning of his service, Allison Folsom, the Marine Corps officer contacted by the Warren Commission to discuss Oswald's training, said that Oswald's score on the last test he took in 1959 indicated he was a *"poor shot"*. Folsom actually went further than this, and volunteered that, due to inactivity, there was reason to believe Oswald's skills had depreciated even further since that time.
- Even worse, Oswald's Marine Corps scorebook, CE 239, reflects that he had only been trained to shoot on stationary targets, and never from elevation. It takes a bit of practice to learn how to lead a moving target, and a bit more practice to learn how firing from elevation has an effect on this lead. For one thing, there's less bullet drop. A military rifle fires slightly above its crosshairs, to account for the effects of gravity on the bullet. When firing downwards from elevation, however, the gravity effect is lessened, and an inexperienced sniper will probably aim high. The difficulty of shooting a moving target is confirmed by the 2007 book, *To Be a Military Sniper*, which notes *"engaging a moving target is a skill that can be developed and maintained only through constant practice."* Not only had Oswald never received training as a sniper, the Warren Commission found no evidence Oswald had EVER fired his rifle on a moving target.
- *Military Science and Tactics*, a WWII-era textbook written *"Conforming to the War Department Program"*, which would presumably be relevant to Oswald's training 14 years later, reflects that U.S. soldiers are trained to fire from the Prone, Sitting, Kneeling, and Standing positions. The drawing for the *"Sitting"* position is of a soldier sitting on the ground. This makes me suspect that Oswald had never practiced shooting while sitting on a box.
- This book also asserts, in a section entitled *"General Rules for Positions"* *"(1) To assume any position first face the target and then face half right. In any position the rifle makes an angle of about 45 degrees with the front of the body or the spine."* If Oswald was the shooter in the sniper's nest, then, his training would have dictated his facing the west side of the building, and turning his upper torso and rifle to fire out the window.
- This book also asserts, in a section entitled *"Marksmanship, Moving Targets"*, that *"There is no unit of measure for leads that the rifleman can quickly apply except the target itself. That is all he sees. So the unit of measure for leads is the actual target...When the trigger is correctly*

squeezed the rifleman does not know when the piece will go off. Accordingly, when he has obtained the correct lead, the rifle must continue to be swung smoothly and uniformly to maintain the lead while squeezing the trigger. The tendency to stop swinging the piece when the lead has been obtained, and fire instantly by jerking the trigger, must be avoided. This is of utmost importance. The rifleman begins to squeeze the trigger as soon as he has his lead, and maintains his lead by swinging the piece while pressing the trigger." Well, this is interesting. Oswald's facing west would have made his tracking a target from directly to his left to 45 degrees to his left a bit awkward, particularly if he was using a box as a rifle rest. In fact, this passage makes me suspect that a military-trained sniper would not even use a rifle rest for such a shot, as it would only prohibit the "smooth and uniform" movement of his rifle as he tracked his target.

- A 1970's era U.S. Marine Corps Scout/Sniper Data Book in my possession confirms this last point. Its section on *"Leads"* reads: *"Moving targets are the most difficult to hit. When engaging a target which is moving laterally across his line of sight, the sniper must concentrate on moving his weapon with the target while aiming at a point some distance ahead. Holding this 'lead', the sniper fires and follows through with the movement after the shot. Using this method, the sniper reduces the possibility of missing..."*
- Intriguingly, however, this Data Book then proceeds: *"Another method of leading a target, and one which is used extensively by snipers, is known as the 'point' lead. By 'point lead' we mean the sniper selects a point some distance in front of his target and holds the crosshairs on that point. As the target moves across the horizontal crosshair, it will eventually reach a point which is the proper lead distance from the center. At that instant the sniper must fire his shot. This is a very simple method of hitting a moving target, but a few basic marksmanship skills must not be forgotten: The sniper must not only estimate his target range, but also its speed and angle of travel relative to his line of sight in order to determine the correct lead. The sniper must continue to concentrate on his crosshairs and not on his target. The sniper must continue to squeeze the trigger and not jerk or flinch prior to the shot being fired."* To Be a Military Sniper confirms this point, noting that shooting in this manner is *"the preferred method of engaging moving targets."* Well, this raises a few questions: 1) when would Oswald have learned to fire in this manner?; and 2) if a shooter did use a cardboard box for a rifle rest, and fire after acquiring a "point lead" and MISS, as supposedly happened in Dallas, wouldn't this cut into the likelihood of his successfully firing two rapid-fire shots in the next 8 seconds? Let's see. He hasn't been actively tracking the target. He has already guessed wrong. Are we to believe he then re-acquired his target, tracked it successfully through a tree, and fired successfully, not once but twice, the first time in 3 seconds, and the second time in 5 seconds.
- An even greater reason to doubt Oswald established a *"point"* lead on Kennedy comes from looking at the sniper's nest view above. The President would have been coming into view not from the left of the scope, but from below--out from under the rifle barrel. This would have given Oswald (or the sniper presumed to have been Oswald) very little time to react, particularly if he was using the iron sights. It follows then that the sniper almost certainly tracked Kennedy along Elm Street, and did not use a cardboard box as a rifle rest.
- There are reasons to doubt Oswald did the tracking, however. On the next page of the data book, when discussing the lead times given walking soldiers, based upon the angle they are walking in relation to the sniper, another problem becomes clear: *"The leads previously mentioned hold true for a right-handed shooter firing on a target moving from his right to his left. If the target is moving from left to right, the lead must be doubled due to a natural hesitation to follow through when swinging against the shooting shoulder. This hesitation is extremely difficult to overcome even by the most experienced shooters."*

- This hesitation is confirmed, moreover, by *The Ultimate Guide to U.S. Special Forces Skills, Tactics and Techniques* (2011). When discussing shooting on moving targets, it notes *"Double leads are sometimes necessary for a sniper who uses the swing-through method on a target that is moving toward his firing side. The double lead is necessary because of the difficulty that a person has in swinging his weapon smoothly toward his firing side. Practice on a known-distance range and meticulous record-keeping are required to hone a sniper's moving target engagement skill."* Hmm... As proven on the slide above, the target car was moving upward from the sniper's nest shooter's left to his right. Oswald was a right-handed shooter. Now...are we to believe he both had the practice necessary to "hone a sniper's moving target engagement skill", and that he somehow knew how to compensate for his *"natural hesitation"*? Or was it just dumb luck he hit Kennedy twice in three tries?
- In 1993, noted gun expert Massad Ayoob wrote an article for *Handgunner Magazine* in which he discussed his own impression of the shots attributed to Oswald. He noted that the two fastest shooters in a 1992 re-enactment of Oswald's purported shooting feat were both left-handed shooters firing from their left shoulder, and operating the bolt with their right hand. (The specifics of this re-enactment are not described, so no judgment can be made on its accuracy.) Anyhow, Ayoob's observation on the lefties supports what was said in the data book about left-handed shooters having a noticeable advantage when shooting at targets moving from left to right. While concluding that Oswald could indeed have made the shots, Ayoob does so in part because of speculation Oswald was a left-eye dominant shooter. There is no indication of this anywhere outside Oswald's mother's recollection he was left-handed--a point rejected by both Oswald's wife and his brothers. (Apparently, his mother was confusing him with his brother Robert, who was left-handed.) In addition, the only known photo of Oswald firing a rifle shows him to be shooting right-handed with his right eye. (Information found online suggests both that the Marines keep an eye out for left-eye dominant shooters and that they train them to shoot left-handed when discovered.) As a result, Ayoob's speculation falls flat.
- Oswald's purported use of his scope only magnifies this problem. *Guns of the Elite*, a 1987 book on snipers and sniper weapons, notes *"optical sights suffer certain inherent problems. Not only are they complicated--and often too delicate to withstand the rigours of military service--but magnification of the target means that the firer's eyes see different images if both eyes remain open during the shooting. Thus, though the sights improve deliberate shooting, they can hinder target location and (particularly) engagement of moving targets."* This book then goes on to note that some armies have learned to account for this problem by using 1.5 power scopes on their sniper rifles, which permit *"a wider field of view"* than 4 power scopes. The scope on the assassination rifle was a 4 power scope. If Oswald was using this scope, with its limited field of view, it seems highly unlikely he could have accurately established a *"point lead"* on a target coming from below and to his left. If he missed this first shot, furthermore, it seems unlikely he could have adjusted rapidly enough to track the target through a tree and fire two accurate shots, the first one within a second of the target coming out from behind the tree, and the second less than 5 seconds later.
- This last point is supported by the Army's tests of Oswald's rifle in March, 1964. The three Master rifleman chosen to test the rifle, after being allowed as much time as needed for the first shot, missed the second shot 4 of 6 times, even though they were aiming at a stationary target, and their target was approximately 3 times larger than the approximately 7 inch circle within which Oswald had purportedly placed two shots. The sudden switch from waiting to turning and firing was apparently a difficult one, made even more difficult by the use of a scope.
- Intriguingly, the HSCA came to agree that Oswald's use of the scope was unlikely. Their Firearms Panel concluded *"that an individual could attain better accuracy using the iron sights*

than the scope under the circumstances involved in Dealey Plaza." In his testimony, the panel's spokesman, Monty Lutz, explained why. First he questioned the accuracy of the scope. He claimed *"The accuracy is fairly undependable, as far as once getting the rifle sighted in, and it is very cheaply made. The scope itself has a crosshair reticle that is subject to movement or being capable of being dislodged from dropping, from impact, or a very sharp recoil. So the accuracy would be somewhat questionable for this particular type of a scope."* Then he questioned if the scope would be of help even under optimal conditions. He explained: *"This scope, I will apply the principle to it. We are dealing with a four-power or a magnification of 4. The field of view is 18, meaning an 18-foot circle at 100 yards. So it is a 4 x 18 scope, a relatively small circle to locate your target in when you are firing and recovering from the recoil in successive shots. So to align your target to get a sighting position, by placing the stock into the shoulder, the head has to be adjusted or moved slightly to the left to align the way that the scope is mounted on the left-hand side and get into position to fire. The scope itself is also designed so that the crosshair, the reticles, do not remain in the exact center position. When you adjust windage or elevation those crosshairs move, so that you are not looking dead center in the object itself. A more natural and easier form or position to fire is to put the rifle against the shoulder, the cheek on the stock, and look right down the center, straight ahead from where you are now positioned, and align the iron sights, the fixed iron sights that are presently on the rifle."* He then testified that, for him, using the iron sights would be *"considerably easier"* than using the scope. None of his colleagues on the panel disagreed.

- While the panel's conclusion was no doubt influenced by the fact they'd found the rifle could also be fired faster when using the iron sights, and the HSCA was anxious to conclude the rifle had been fired faster than previously believed possible, there were presumably other factors influencing their conclusion. Perhaps one of these factors was that, as acknowledged in the 1969 testimony of the FBI's Robert Frazier--the first man to test the weapon--one had to lift one's eye away from the scope between shots in order *"To prevent the bolt of the rifle from striking (one) in the face as it came to the rear."* Perhaps another of these factors was that, when first tested by Frazier on 11-27-1963, the rifle, when fired using the scope, fired 4 inches high and one to the right at only 15 yards. Assuming this was the condition of the rifle as found in the depository, this meant that the sniper, in order to lead the President and hit him in the head while he was moving away and to the right, would have to have fired behind the President, and aimed for low on his back, or perhaps even at the trunk of his limousine. This would have been quite a trick. Perhaps the HSCA Firearms Panel, unlike the Warren Commission, which concluded that the use of the apparently misaligned scope had been a *"substantial aid"* in the shooting, saw the unlikelihood of Oswald pulling off such a trick. Unfortunately for them, however, the only man known to rapid fire the assassination rifle while using the iron sights, a Mr. Miller, the best shooter in the Army's 1964 tests, only attempted one run using these sights... On this run, Mr. Miller not only missed the head and neck silhouette of his third and final target, he missed the target completely.
- A not so quick aside...While some assume the rifle and scope were in alignment on 11-22-63, only to get misaligned in the aftermath of the shooting, there is little real support for this assumption. While Sebastian Latona, the FBI's fingerprint expert, testified before the Warren Commission that the rifle had been dismantled by the FBI's ballistics examiners and inspected for prints prior to the FBI's initial test of the rifle's accuracy, he did not mention the removal of the scope. When the FBI's chief ballistics examiner Robert Frazier testified just a few days prior to Latona, moreover, he indicated he'd been present when the rifle arrived at the laboratory, and also failed to mention the scope had been removed. He did make the nebulous statement that *"apparently the scope had even been taken off of the rifle, in searching for fingerprints on the rifle. So that actually the way it was sighted-in when we got it does not necessarily mean it was*

sighted-in that way when it was abandoned." This indicates that he thought it possible the scope had been removed in the search for fingerprints *in Dallas*, something which was denied by the Dallas crime scene investigator, J.C. Day. Frazier then let on that he had reason to suspect it had not been removed in Dallas; he testified that, upon further examination of the rifle in March 1964, he found that the scope took 5 or 6 shots to stabilize after each adjustment, and that *"When we fired on November 27th, the shots were landing high and slightly to the right. However, the scope was apparently fairly well stabilized at that time, because three shots would land in an area the size of a dime under rapid-fire conditions, which would not have occurred if the interior mechanism of the scope was shifting."* If the scope was stabilized on 11-27, as claimed, and neither the Dallas Police nor FBI had before that time adjusted the scope and fired the rifle 5 or 6 times to stabilize the scope, as Frazier found was necessary, it follows then that the scope had not recently been removed, replaced, and re-adjusted before 11-27, and that the inaccuracies of the rifle on 11-27 were the inaccuracies on 11-22. (Frazier would later confirm this by telling writer David Fisher not that the Dallas Police had adjusted or bumped the scope to knock it out of alignment, but that they'd lost a wooden shim that had been placed beneath the scope to bring it into alignment. He, of course, offered no evidence that this shim had ever existed, let alone that the DPD had lost it after removing the scope.)

- Even if the scope had been removed and haphazardly screwed back on, however, as some presume, it does nothing to suggest the rifle had been accurate on 11-22. All indications are, in fact, that it was not. In March 1964, when Frazier discovered the problem with the stability of the scope, the FBI tried to sight-in the rifle and make it as accurate as possible. They found this was impossible, and that it still fired an average of over 4 inches high and 2 1/2 inches to the right at 100 yards when using the scope even after it was stabilized. While some, apparently including the FBI and Warren Commission, have chosen to assume this misalignment was the misalignment of the rifle on 11-22, and would have worked to Oswald's advantage, they miss entirely that having the rifle fire high and to the right at a distant target moving up and to the right in the scope would only have been an advantage if Oswald knew exactly how misaligned his scope was--and that he only could have known this had he had extensive practice with his rifle...extensive practice for which the FBI and Warren Commission found no evidence...
- In any event, when, subsequent to the FBI, the Army tested the rifle, they found it necessary to add wooden shims beneath the scope mount to bring it into alignment. This was acknowledged in the 3-31-64 testimony of Ronald Simmons, Chief of the Infantry Weapons Evaluation Branch of the Ballistics Research Laboratory of the Department of the Army. The gunsmith who'd worked on the rifle made an interesting observation, moreover, which he passed on to Warren Commission counsel Melvin Eisenberg on April 6, 1964. Eisenberg's Memo for the Record on this conversation was published in the commission's volumes as CE 2560. It reads *"There were three pieces in the scope examined by the BRL gunsmith. Two pieces were .015 inches thick, so placed as to elevate the scope with respect to the gun. One piece was .020 inches thick so placed as to point the scope leftward with respect to the gun. The gunsmith observed that the scope as we received it was installed as if for a left-handed man."* Well, this is fairly confusing, as it suggests the shims were already on the rifle when received by the BRL, when Simmons testified to the opposite. We can only assume, then, that Eisenberg's words are misleading, and that he should have written *"three pieces in the scope **added in** by the BRL gunsmith,"* and not *"**examined** by the gunsmith."* In any event, the gunsmith's observation that *"the scope as we received it was installed as if for a left-handed man"* feeds back into the sniper data book's observation that right-eye dominant shooters have trouble with targets moving left to right, and Ayooob's observation that the best shooters during the re-enactment he'd witnessed had both been left-handed, and presumably left-eye dominant. Was the sniper in the sniper's nest a left-eye dominant shooter firing right-handed to simulate Oswald? Hmmm...

- In 1969, Dr. John Lattimer gave a presentation to the New York Academy of Medicine on his own attempts to replicate Oswald's supposed feat. While claiming his tests showed that Oswald could have performed the shooting, he made some interesting observations which did not remotely support this conclusion. After discussing his acquisition of four rifles like Oswald's, fitting them with scopes like the one found on Oswald's rifle, and picking out the rifle which most closely resembled its overall condition, he admitted: *"To align the sight perfectly, it was necessary to place thin metal wafers (shims) under the front ring of the mount of the telescope, just as had been found necessary with Oswald's rifle, in order to correct the faulty alignment of the telescope."* Well, the shims added to Oswald's rifle were added after it was found in the depository, not before; this suggests that Oswald's rifle was inaccurate, at least when using the scope, and that this was an inherent defect of that rifle and scope combination, not a problem created afterward as presumed by so many single-assassin theorists.
- Lattimer continued: *"It was found that with the sling binding the rifle tightly to the experimenter's arm, and by resting both forearms flat against the legs, above the knees (as was possible from Oswald's high perch), three cartridges could be worked through the action in six or seven seconds, still allowing a short period for aiming, before each simulated shot. If the interval between each shot was increased to five seconds (10 seconds total) aiming became quite easy."* Lattimer failed to explain that he was firing at stationary targets, and that tracking or leading a moving target would be more difficult, and take more time. But I digress...
- Lattimer then said something quite interesting. He noted: *"It was found necessary not only to push the bolt vigorously forward but to pull it vigorously back, each time, with more force than is usually required with bolt-action rifles. Facility with these motions was acquired with many, many workings of the action over a period of two weeks of both simulated and actual firing. It became obvious to us that the ability to fire this rapidly and dexterously required a prolonged period of practice."* Lattimer then proceeded to speculate that Oswald's failed attempt on General Walker "might have persuaded him to sharpen his skill at rapid fire (as he did all too well) by further practice, before November 22..." Well, I'll be. Lattimer's belief Oswald fired the shots is related to his belief Oswald had extensive practice with his rifle...something both the FBI and Warren Commission specifically ruled out!
- Lattimer then drove this point home: *"The prolonged period of practice and familiarization was found to be essential for the achievement of any kind of accuracy during rapid firing of this rifle. In general, we were surprised and interested to observe how effectively proficiency with this rifle could be acquired, if plenty of time was allowed."* Well this suggests as well that a prolonged period of defamiliarization with this rifle would lead to a degeneration of one's skills, does it not? The Warren Commission found no evidence that Oswald had even touched, let alone fired, his rifle for at least six weeks prior to the shooting. They found no evidence he'd ever used it to fire on a moving target. They found no cleaning equipment or spare ammunition among his possessions. This should make us suspect that, if one man fired all the shots on Kennedy, he was either a much better shot than Oswald was presumed to have been in 1963, or had been practicing with Oswald's rifle for some time prior to 11-22.
- This suspicion has received support from surprising sources. On August 27, 1972, Governor John Connally, at that time a former Secretary of the Navy and a soon-to-be Secretary of the Treasury, was asked about the possibility of two assassins on the ABC news program Issues and Answers. He replied: *"if one man did it--and I really think one man did it from all that I know about it--he was an expert at handling that rifle, no question about it, because he got off three shots in a remarkably short period of time."*
- Curiously, Massad Ayoob touched on this same point in his 1993 article when he wrote *"There is reason to believe that Oswald in 1963 had become a far better shot than he was when he only*

made sharpshooter in the Marines." Apparently, Ayoob's "reason" (or lack thereof) was that he believes Oswald fired the shots, so he must have been able to fire the shots, which means he must have been a better shot than he was when he qualified as a sharpshooter, because a mere sharpshooter would not have been accomplished enough to have fired these shots... This totally neglects that Oswald, when last tested by the Marines in 1959, had suffered a noticeable decline in his skills and had barely qualified as a marksman, far below the level of sharpshooter he'd reached in 1956. This neglects as well that in the intervening years, 1959-1963, Oswald had scarcely fired any weapon, let alone the assassination weapon, a bolt-action rifle far more difficult to operate than the semi-automatic rifle he'd fired while in the Marines.

- In 1994, former sniper Craig Roberts released his book *Kill Zone: A Sniper Looks At Dealey Plaza*. In the book, he not only expressed doubt that a right handed shooter could fire effectively from the crowded corner window of the depository, and hit a target just as it emerged from behind a tree, he recounted a discussion he had with legendary Marine Corps sniper Carlos Hathcock. Hathcock reportedly told him *"Let me tell you what we did at Quantico. We reconstructed the whole thing: the angle, the range, the moving target, the time limit, the obstacles, everything. I don't know how many times we tried it, but we couldn't duplicate what the Warren Commission said Oswald did."* This should make us suspect that the super shooter necessitated by Lattimer's observations quite possibly did not exist, and that more than one shooter fired the shots on the motorcade.

So...single-assassin theorists supporting the LPM scenario have a choice. First, to be true to Lattimer, they must agree that the Warren Commission was wrong and hold that Oswald had somehow acquired extensive practice with his rifle. Second, to be true to the accumulated literature on sniping they should either 1) assert Oswald used a gun rest and a scope, and missed anyhow, and then propose he successfully fired the next two shots while using the iron sights, or 2) take a cue from the HSCA and admit the use of a scope would only complicate his shots, and assert that he tracked the limo using the iron sights for all three shots. In any alternative, they should admit that the photos of Kennedy's stand-in taken through a 4 power scope from the sniper's nest at the moment of the head shot are deceptive, and most probably not representative of what was actually seen by the sniper.

That they continue to use this photo to push that the shots were easy and that Oswald used a scope indicates that they either have far greater faith in Oswald's ability and/or luck than warranted or far less respect for the truth than desired.

Chapter 9b: Reclaiming History from Reclaiming History

A thorough examination of a selective use of evidence

Vincent Bugliosi is the Real Oliver Stone

by Patrick Speer

Part 1: A Book for the Ages

In May 2007, a mammoth book was released defending the Warren Commission's conclusion that Lee Harvey Oswald, acting alone, killed President John F. Kennedy on November 22, 1963. This book was entitled *Reclaiming History* and it was written by Vincent Bugliosi.

On the website of his publisher, W. W. Norton, the following description of Bugliosi's epic was posted:

- The book that lays all questions to rest.
- Polls reveal that over 75 percent of Americans believe there was a conspiracy behind Lee Harvey Oswald; some even believe Oswald was entirely innocent. In this absorbing and historic book—the first ever to cover the entire case—Vincent Bugliosi shows how we have come to believe such lies about an event that changed the course of history.
- The brilliant prosecutor of Charles Manson and the man who forged an iron-clad case of circumstantial guilt around O. J. Simpson in his best-selling *Outrage*, Bugliosi is perhaps the only man in America capable of "prosecuting" Oswald for the murder of President Kennedy. His book is a narrative compendium of fact, forensic evidence, reexamination of key witnesses, and common sense. Every detail and nuance is accounted for; every conspiracy theory revealed as a fraud upon the American public. Bugliosi's irresistible logic, command of the evidence, and ability to draw startling inferences shed fresh light on this American nightmare. At last we know what really happened. At last it all makes sense. 32 pages of illustrations.

To promote the book, Bugliosi and his publisher embarked on a weeks-long media blitz.

On May 10, 2007, a review of the book was published in the L.A. Times. The writer of this review, Jim Newton, was not exactly a disinterested party, as, only months before, he had released a book with the shared goal of resurrecting the reputation of Chief Justice Earl Warren. A sample of this review:

- Bugliosi worked for 20 years on this book, bringing his legal skills to bear. Weighing in at more than 1,600 pages, it offers a minutely detailed recreation of Kennedy's assassination and features the legendary prosecutor's enthusiastic (often gleeful) debunking of various conspiracy theories, concluding that Lee Harvey Oswald did indeed act alone.
- After reading what may be Bugliosi's crowning work (more than 1,600 pages, not to mention an additional 1,100 pages of notes on an accompanying CD), one thinks: At last, someone has done it, put all the pieces together. "Reclaiming History: The Assassination of President John F. Kennedy" is important not just because it's correct, though it is. It's significant not just because it is comprehensive -- surely, no one will deny that. It is essential, first and foremost, because it is conclusive. From this point forward, no reasonable person can argue that Lee Harvey Oswald was innocent; no sane person can take seriously assertions that Kennedy was killed by the CIA, Fidel Castro, the Mob, the Soviets, the Vietnamese, Texas oilmen or his vice president, Lyndon B. Johnson -- all of whom exist as suspects in the vacuous world of conspiracy theorists. Each may be guilty of crimes, but none had anything to do with Kennedy's assassination. "Reclaiming History" may finally move those accusations beyond civilized debate.
- Bugliosi...begins by re-creating the events of the assassination, describing the investigations into that terrible day and examining the evidence collected by the various police agencies, the FBI, the commission led by Supreme Court Chief Justice Earl Warren and others. Bugliosi is a keen analyst of that material; his dissection of the medical evidence is particularly telling. He establishes that Oswald fired three shots from the window of the Texas School Book Depository. One missed; one hit Kennedy in the upper back, then passed through his body and pierced then-Texas Gov. John B. Connally; the third struck Kennedy in the back of the head, killing him.
- Those who come to Bugliosi's book with sympathy for conspiracy theories may wince at the punishment he inflicts across so many pages. He suffers no fools, and Kennedy's assassination has produced more than its share of foolish speculators; he will make some enemies with this work. It seems fair to say that he's unlikely to care.
- Bugliosi's book isn't for everyone. It is, by his admission, one of "abnormal length." Its organization -- a scintillating, minute-by-minute account of the events surrounding the assassination that segues into long chapters examining aspects of the case in fine detail -- results

in a certain amount of repetition.

- But no serious scholar of the president's assassination will ever write again on the subject without citing Bugliosi. And there are more works to come -- most promising, a long-awaited look at the Warren Commission from author Max Holland ("The Kennedy Assassination Tapes").
- No doubt there also will be more works of confusion and idiocy. Happily, however, from this point forward, all contributors to the field must build on "Reclaiming History."
- With this work, Bugliosi has definitively explained the murder that recalibrated modern America. **It is a book for the ages.**

On May 12, 2007, links to a video-taped interview of Bugliosi were posted on assassination-related newsgroups. In this video, Bugliosi explained his decision to devote so much time to his book. The words he used seemed oddly familiar. He said: *"I think the assassination is a significantly important event, sufficiently important to warrant that there be **a book for the ages** about it. And Reclaiming History is that book. When I started writing the book it was to write **a book for the ages** about the Kennedy assassination, and that's precisely what it is...It's **a book for the ages**."* Strangely prescient, this interview was supposedly filmed on 4-30-07, ten days before the publication of Newton's review calling Reclaiming History "a book for the ages."

On May 14, 2007, a review written by Bryan Burrough, a special correspondent at Vanity Fair, was published in the New York Times. A sample of this review:

- Putting aside its ridiculous length, I have to say "Reclaiming History" is in spots a delight to read. Bugliosi is refreshing because he doesn't just pick apart the conspiracy theorists. He ridicules them, and by name, writing that "most of them are as kooky as a \$3 bill." Bugliosi calls the dean of conspiracy buffs, Mark Lane, "unprincipled" and "a fraud." He quotes Harold Weisberg, the author of eight conspiracy-themed books, admitting that after 35 years of research, "much as it looks like Oswald was some kind of agent for somebody, I have not found a shred of evidence to support it."
- What Bugliosi has done is a public service; these people should be ridiculed, even shunned. It's time we marginalized Kennedy conspiracy theorists the way we've marginalized smokers; next time one of your co-workers starts in about Oswald and the C.I.A., make him stand in the rain with the other outcasts. "Reclaiming History," though, is more than a critical analysis. Bugliosi knows how to construct a narrative, and his 316-page retelling of those "four days in November," a book in itself, is as good a second-by-second reconstruction of the assassination and its aftermath as I've read.
- It's in the arguing that Bugliosi, as a former prosecutor, truly shines. When he gets down to the sweaty business of wrestling the conspiracy buffs, he charges into the ring as a righteous avenger, body-slamming everyone from Lane to *Oliver Stone*; he even throws a headlock on poor Gerald Posner, who actually agrees with him.
- This book should be applauded; I'm not sure, however, that it should be read. At this length, "Reclaiming History" is the literary equivalent of World War I, a kind of trench warfare for the mind. Is anyone really expected to read the whole thing?...Other than masochistic conspiracy buffs, I cannot imagine a soul who will.
- Bugliosi senses this. "Many other readers," he writes, "will say to themselves, 'Why does he keep piling one argument upon another to prove his point? He's already made it 12 ways from Sunday, so why go on?'" To those readers I say that the Warren Commission also made its point, and well, over 40 years ago, yet today the overwhelming majority of Americans do not accept its conclusion. ... Hence, the overkill in this book is historically necessary."
- He's probably right, which is a shame. In an age when people under 30 seem to get their news

from Jon Stewart or some guy who still lives in his mother's basement, most Americans probably do believe that there was a conspiracy, and that it involved our own government. In other words, *Oliver Stone* — for crying out loud, *Oliver Stone* — is more believable than Earl Warren, the F.B.I. or any of the august Americans who vetted the Warren Commission report. Well, after Watergate, Cambodia, Iran-contra, Monica's stained dress and weapons of mass destruction, I guess that's understandable. Go ahead and buy this book if you feel the need to poke the conspiracy-mongers in the eye, or if you've got a month or four to kill. Just be careful about the coffee table. It might break.

In the days and weeks that followed, equally positive reviews were published in *The Atlantic Monthly*, *The Boston Globe*, *The Philadelphia Inquirer*, *The New York Post*, *The Wall Street Journal*, *The St. Louis Press-Dispatch*, *The Washington Times*, and *The International Criminal Justice Review* (to name but a few). During these weeks Bugliosi criss-crossed the country on a promotional tour, making short appearances on TV and radio, and delivering a semi-scripted speech before large groups. At the outset of this speech, not surprisingly, he regularly quoted the L.A. Times in describing his book as "**a book for the ages**".

On May 27, 2007, Alan Wolfe, director of the Boisi Center for Religion and American Public Life at Boston College, reviewed the book for the *Washington Post*. Here is a sample of his review:

- To say that Bugliosi wants to strike a nail in the coffin of Kennedy assassination conspiracy theorists is putting it mildly; he wants to drive a tractor trailer through their ranks and scatter everyone in sight. Is such an effort really necessary? I am afraid it is, which is another way of saying that we ought to be grateful for Bugliosi's obsession.
- Lee Harvey Oswald, acting alone, killed John F. Kennedy. Absent a trial proving his guilt, Bugliosi, author of *Helter Skelter*, has offered the next best thing: a prosecutor's air-tight brief that leaves no reasonable doubt. A short review cannot possibly do justice to the case he assembles, so let me just offer a taste of Bugliosi's methods. The first thing he does is to describe, in exhaustive detail, everything that happened on the day Kennedy was shot. Then, in the second half of the book, Bugliosi takes each of the leading conspiracy theories -- that there was a second Oswald, that the mob plotted the assassination, that the CIA did it and so on -- and demolishes their claims.
- If you read, or even read around in this book and still come to the conclusion that Oswald was part of a conspiracy to kill Kennedy, you are likely to believe that black helicopters have been sent by the feds to enforce the Endangered Species Act.
- Bugliosi is right that this case is, and ought to be, closed. And I share his distaste for the wild finger-pointing and often paranoid reasoning of the Warren Report's critics, from the overweening New York State Assemblyman Mark Lane in the 1960s to the *irresponsible filmmaker* *Oliver Stone* in the 1990s. Still, maybe there should be a place kept for the conspiracy theory buffs. After all, they care passionately about one of the most important political events in our history. In an age of indifference, their attention to public life, however corrosive, can be more valuable than apathy and indifference.

On September 18, 2007, the work of Bugliosi and his publicists, both paid and unpaid, paid off. TimeWarner, the parent company of HBO revealed:

- HBO Films and Playtone have acquired Vincent Bugliosi's recent epic book *Reclaiming History: The Assassination of President John F. Kennedy*, which debunks conspiracy theories to establish that Lee Harvey Oswald acted alone when he shot the President on Nov. 22, 1963, it was announced today by Colin Callender, president, HBO Films. Playtone's Tom Hanks and Gary Goetzman will executive produce the ten-part miniseries with Bill Paxton, the star of the

HBO series *Big Love*, which Playtone produces in association with HBO...

- The project found its way to Playtone and HBO through the efforts of actor Bill Paxton, a native Texan who brought the recently published book to Hanks and Goetzman, his producers on HBO's *Big Love*. A native Texan, Paxton was a child when he accompanied his 11-year-old brother and father to an appearance that President Kennedy made in Paxton's hometown of Fort Worth on Nov. 22, 1963 before moving on to visit Dallas.

Bill Paxton had believed the hype.

And who could blame him?

Here was his chance to get involved in an important project, one reportedly "for the ages." Here was a golden opportunity to help Vincent Bugliosi in his quest to reclaim history from the distortions of conspiracy theorists, including but not limited to the much-vilified Oliver Stone.

But what Bill Paxton didn't realize is that Vincent Bugliosi is the real Oliver Stone.

Part 2: Throwing Stones

From the publicity campaign of Vincent Bugliosi's publisher, and the media praise for his book, someone not fully immersed in the historical facts of the assassination, such as Bill Paxton, would almost certainly have come to believe that Vincent Bugliosi is a meticulous researcher, with an unparalleled understanding of the case. He would also no doubt have come to believe that Bugliosi is nothing like Oliver Stone, a film maker who, in 1991, dared to make a film depicting what he described as a counter-myth to the officially-sanctioned myth that Lee Harvey Oswald acted alone in killing President Kennedy, and someone whose name is now bandied-about by conservatives the way Senator Joe McCarthy's name was once bandied about by liberals.

In interviews promoting his book, Bugliosi fed this impression. He repeated with regularity that "Oliver Stone's movie, JFK, is one continuous lie." In several of the interviews he went further and claimed that, with his film, Stone had committed "cinematic murder." Bugliosi's disdain for Stone was nothing new. Way back in 1992, shortly after the release of Stone's film, Bugliosi had complained that Stone "deliberately twisted and warped the record."

At that point in time Bugliosi's comments received scant attention, as he was simply piling on. Before Stone's film had even been completed, on May 14, 1991, Jon Margolis of the Dallas Morning News declared: *"There is a point at which intellectual myopia becomes morally repugnant. Stone's new movie proves that he has passed that point."* On December 15, 1991, in the New York Times, Tom Wicker complained that Stone *"implies that anyone who doesn't share his one true faith is either an active part of a coverup or passively acquiescent of it...he uses the powerful instrument of a motion picture, and relies on stars of the entertainment world to propagate the one true faith."* On December 17, in the Washington Post, Gerald Ford and David Belin asserted that charges in Stone's film *"are a desecration to the memory of President Kennedy, a desecration to the memory of Earl Warren and a fraudulent misrepresentation of the truth to the American public."* On December 23 an article in Newsweek pointedly called Stone's film *"a work of propaganda."* On December 25 Brent Staples of the New York Times complained that the film *"contains one factual misstatement after another."* On December 29 an editorial in the Chicago Sun-Times boldly asserted that it was an *"inaccurate and distorted motion picture"*. A December 30 article in the Los Angeles Times written by Richard Mosk, moreover, called Stone's film a *"false history"* and complained that *"for motion picture moguls after a fast buck to portray fiction as fact and to assassinate the characters of the living as well as the dead is irresponsible and inexcusable."* On January 28, 1992, in the Wall Street Journal, Joseph Califano, a former adviser to Kennedy's successor, Lyndon Johnson, denounced Stone's film as *"a disgraceful concoction of lies and distortions"*. And finally, on April 2, 1992, the man in the middle, former

Johnson assistant Jack Valenti, who, ironically enough, was then sitting at the helm of the Motion Picture Academy of America, shared his thoughts with the New York Times. Valenti called Stone's film a "hoax." He asserted that *"In scene after scene Mr. Stone plasters together the half true and the totally false and from that he manufactures the plausible...In much the same way, young German boys and girls in 1941 were mesmerized by Leni Riefenstahl's Triumph of the Will in which Adolf Hitler was depicted as a newborn God."*

And so Oliver Stone, a film maker who presented an admitted work of fiction, but one which felt more true to many than the official story told by the Warren Commission, was denounced as some sort of Nazi-styled propagandist, and by the head of the Motion Picture Academy of America no less.

With Reclaiming History, Bugliosi revived this line of attack:

- On page 1357 Bugliosi writes *"When Stone was met with an unexpected avalanche of media criticism for the distortions and inventions in his movie around the time of release, some of which he was forced to acknowledge, he retreated by saying that the Warren Commission was a myth and JFK was a 'counter-myth' but, obviously, he said this just to get him past the moment...You can't tell one major lie about the assassination after another for three consecutive hours, and with full knowledge that, as Vincent Canby says, 'anything shown in a movie tends to be taken as a truth,' and escape responsibility for your monstrous hoax by suggesting you are only presenting an alternative view for the audience's consideration."*
- On page 1431, he continues to rail against Stone and his film: *"the movie is virtually one continuous lie in which Stone couldn't find any level of deception and invention beyond which he was unwilling to go. And yet the whole thrust of the movie is that what was being depicted on the screen was the truth, and everyone else was lying...But Oliver, how can the truth be known when you did everything within your power to make sure that your audience never knew what the evidence showed the truth to be?"*
- Shortly thereafter, Bugliosi engages in some amateur psychiatry, with Stone as his patient: *"In achieving what he perceives to be a 'higher truth' in the Kennedy assassination, he was willing to take enormous liberties with the truth, making him a classic example of one who believes that the end justifies the means."*
- On page 1435, Bugliosi explains to his readers why he is different than Stone: *"I believe that history is sacred and should not knowingly be tampered with. In imposing a narrative on a historical event, obviously a certain amount of dramatic license and embellishment is unavoidable, but even this device should be used with great caution and economy. Outright fabrications of important matters that necessarily cause viewers or readers to reach a different conclusion is a cultural crime. We can only ensure the past's future if we respect its truths."*
- On page 1436, he concludes his assessment of Stone: *"the history of the assassination has not been forgotten by Oliver Stone. Except for those instances where ignorance is his only defense, it's been deliberately invented or ignored. That's fine. But he had a moral, if not a legal obligation, to tell his audience what he was up to...in his introduction to his friend Fletcher Prouty's book, Stone, alluding to the fact that the victor writes the history of an event, asks, 'Who owns reality? Who owns our history? He who makes it up so that most everyone believes it. That person wins.' For once, I agree with Oliver Stone. That is, unless the fabricator is exposed, as I trust I have done in this book."*

From these statements, it is clear that Bugliosi considers Stone's methods reprehensible, and considers himself a more moral and trustworthy man than Stone. But is this true?

In the Introduction to Reclaiming History, on page xxxix:, Bugliosi writes: *"when anyone purporting to write the history of the event fabricates, distorts, or misleads about the facts of the case, it is not only*

advisable but incumbent upon those who subsequently write about the event to point out these lies and distortions. If they do not the lies themselves will harden in the future into "facts" and millions will be misled. This is precisely what has already happened in this case. After all, if future writers don't correct the errors and distortions of their predecessors, then who will? If they don't have the responsibility to do this, who does? Therefore, if those who follow me find that in writing this book I myself have taken liberties with the truth, I would expect them to bring this to the attention of their readers."

This brings us to the heart of our discussion.

Part 3: The Case Against Vincent Bugliosi

Explicit in Bugliosi's criticism of Stone and his film is that Stone, as a creator of narrative and of film, was under a special obligation to present the facts as accurately as possible. Implicit in this argument is that Bugliosi himself has presented his facts as accurately as possible in his book, and has not been deliberately deceptive. This, I believe is untrue.

In earlier discussions of Bugliosi's book, available online, I have pointed out some glaring inconsistencies. On pages 421-423 of *Reclaiming History* Bugliosi asserts that the entrance wound on Kennedy's back was below the exit wound on his throat, but, as Kennedy was leaning forward when hit, this still reflected a shot shot from above and behind. He cites the expert opinions of the HSCA's medical panel in support of this argument, and includes three illustrations to demonstrate how this could be true. But then, on page 424, he declares that he personally compared two autopsy photos, and that they prove the back wound was actually above the throat wound. He never explains why his inexpert analysis of these photos should be trusted over the analysis of the "experts" he has just cited. On page 41 he writes that the second shot was fired 4.9 seconds before the fatal head shot, which correlates to a shot impacting around frame 224 of the Zapruder film. And yet, in the second photo section, he proposes that the shot occurred within a split second of frame 210 of the Zapruder film. On page 458, he incorrectly argues that Governor Connally's seat in the limousine was 6 inches inboard of its right door, and that Governor Connally's right armpit was therefore in perfect alignment to receive a bullet exiting President Kennedy's throat. And yet, in the second photo section, he presents a computer-generated image of the limousine based on a schematic of the limousine, which reveals the seat to have been only 2.5 inches inboard of the door. These are, most likely, honest and understandable mistakes, revealing only that Bugliosi was human and unable to master the complex questions surrounding the medical evidence, the Zapruder film, and the precise locations of Kennedy and Connally within the limousine.

But there is an aspect to the case which requires no special knowledge, an aspect to the case that anyone with the ability to read can readily comprehend. This aspect, moreover, is the central pillar around which a seasoned prosecutor like Bugliosi would normally build his case. His source notes, in fact, display a clear familiarity with this aspect of the case.

This aspect is none other than the sworn statements and testimony of the eyewitnesses to the shooting.

One would think that someone with Bugliosi's reputation and reverence for history would treat the statements of these witnesses with respect.

But while reading *Reclaiming History* I found this was far from the case. As Valenti once said of Stone, Bugliosi "plasters together the half true and the totally false and from that he manufactures the plausible."

So let's take a close look at how Mr. "narrative should be used with great caution and economy" performs, when describing the central event of his "book for the ages." Let's see if what Bugliosi has described as possibly the most-sourced book in non-fiction history is an accurate reflection of its sources, or just an accurate reflection of Bugliosi's desire to reclaim history for himself.

Before we can begin, however, we need to understand that among the questions about the case Bugliosi purports to answer is the timing of the shots that killed the President. On page 39, Bugliosi writes "First shot---:00.0 seconds BANG!," and describes reactions to this shot. On page 40, he writes "Second shot--:03.5 seconds BANG!" and describes reactions to this shot. And then on page 41, he writes "Third shot--:08.4 seconds BANG!" and describes reactions to this shot, which he asserts strikes Kennedy in the head. As these descriptions are in Book One of Reclaiming History, which Bugliosi modestly entitles "Matters of Fact--What Happened," and as he dedicates his book to the "historical record" which he holds to be "sacred," it is more than clear that Bugliosi is asserting that the timing of these shots, and the testimony he uses to describe these shots, is in keeping with the historical record, and is not just his gut feeling about what might have happened.

We can put this to the test. As the final shot presented by Bugliosi impacts on Kennedy's cranium at frame 313 of Abraham Zapruder's film of the shooting, and as Zapruder's camera is believed to have been filming roughly 18.3 frames per second, it becomes apparent that Bugliosi is claiming the second shot impacted circa frame 224 of the film, and the first shot circa frame 160. This scenario, currently the rage among Bugliosi's fellow single-assassin theorists, is considerably longer than the scenario initially suggested by the FBI and Secret Service in 1964, and, not surprisingly, gives the shooter firing Oswald's bolt-action rifle much more time to fire his shots.

There's a huge problem with this scenario, however. Just after frame 160 of the Zapruder film, Kennedy smiles to the crowd, and waves to a group of cheering women at his right.

So let's see if Bugliosi's narrative for this first shot, beginning on page 39, describes this event and presents any witnesses to assert that Kennedy ignored the first shot and resumed waving to the crowd.

Sorry, no need to waste your time. There are no such witnesses.

So then let's see if the statements and testimony of the witnesses he does offer actually support his scenario, once one studies their entire statements and testimony. When their statements support his scenario, or can reasonably be interpreted as supporting his scenario, we'll call it a **FAIR** use of evidence. When their statements fail to suggest his scenario, and suggest another scenario entirely, and this information is concealed from the reader, we'll call it an **UNFAIR** use of evidence. And when he uses statements and testimony in his book, in a way that appears to deliberately mislead the reader, we'll call it a **SUSPICIOUS** use of evidence. When we've already written Bugliosi's use of a witness off as unfair or suspicious, however, and he accurately presents this witness a second or third time to describe an unrelated response to the shots, we'll call it a fair use of evidence. Those pressed for time may wish to simply look for the word **SUSPICIOUS**, then backtrack to the name of the preceding witness, and read my discussion of why Bugliosi's treatment of this witness is indeed suspicious.

(The letters and numbers in parentheses in the following discussion refer to the locations of source documents in the Warren Commission documents available at Maryferrell.org. A number at the beginning refers to the Warren Commission appendix number, the number following the H refers to the page. A CD at the beginning means the document was not released in one of the Warren Commission's 26 volumes, and can only be found online in the Warren Commission documents section of the website. The number after the CD refers to the document, the numbers after the "p" refers to the page.)

Bugliosi's First Strike

- Bugliosi's narrative starts out awkwardly. He writes of this first shot: "*The three stock boys in the Depository think it's a firearm salute for the President*". Well, call me Mr. PC if you like, but I suspect an order checker like James Jarman would not appreciate being called a "stock boy"--seeing as he was 34 years old and had served 8 years in the U.S. Army and all. As one of the other "stock boys", Harold Norman, was 26, in fact, we should suspect that the "boy" status of

these men has little to do with their age. (If you guessed that all three men were black, you win a cookie.)

- Bugliosi then specifies the thoughts of the third "stock boy". He writes: "*maybe, **Bonnie Ray Williams** thinks, it's a firecracker.*" For Bugliosi, Williams' impressions are of paramount importance. Later, on page 469, he uses Williams' assumption that Kennedy was brushing back his hair just before the first shot as evidence the shot rang out around frame 160 of the Zapruder film. What Bugliosi conceals from his readers, however, is that an affidavit signed by Williams on the day of the shooting reveals that he heard but two shots (24H229) and that he subsequently confirmed this appraisal in statements to the FBI (CD5 p330-333) and Secret Service (CD87 p784). If Williams heard but two shots, the first of which was a missed shot as early as frame 160, as Bugliosi purports, this means he somehow missed hearing one of the two shots to impact on Kennedy, even though the shooter firing these shots was, according to Bugliosi, in the sixth floor sniper's nest of the school book depository, just a few yards above the open fifth floor window occupied by Williams.
- Apparently, this point was not lost on Bugliosi, as he bypasses these early statements and cites Williams' Warren Commission testimony as his source for Williams' thoughts about the firecracker. Here, after months of hearing that Oswald had fired three shots, Williams finally relented and said he heard three shots. But there's a huge problem with this. Williams didn't just testify to hearing three shots, he testified as to how he heard them. Williams stated: "*there was two shots rather close together. The second and the third shot was closer together than the first shot and the second shot, as I remember...the first shot—I really did not pay much attention to it, because I did not know what was happening. The second shot it sounded like it was right in the building, the second and third shot. And it sounded—it even shook the building...I heard three shots, but at first I told the FBI I only heard two--they took me down--because I was excited, and I couldn't remember too well. But later on, as everything began to die down, I got my memory even a little better than on the 22nd. I remembered three shots, because there was a pause between the first two shots. There was two real quick. There was three shots.*" (3H 161-184)
- In Bugliosi's scenario, of course, the first and second shots are much closer together than the second and third. As the Zapruder film demonstrates that Kennedy is hit somewhere between frames 190 and 224, and then again at 313, any statement claiming the last two shots were closer together implies either that the first shot came way before frame 160, even before Zapruder began filming the motorcade on Elm--which Bugliosi would reject--or that the first shot did not miss. Williams' testimony that the last two shots were closer together, particularly when viewed through the prism that, as reported by Psychologist Elizabeth Loftus among others, time normally slows down for eyewitnesses as traumatic events unfold, is therefore a clear suggestion that the first shot did not miss. (The mutual exclusivity of the first shot's having missed and the last two shots being closer together than shots one and two is depicted in Appendix One.) As Bugliosi proposes there were three shots, and that the last two were almost five seconds apart, he could have argued that the first shot heard by Williams was the second shot proposed by himself, and that Williams later re-interpreted the third shot as two shots. But Bugliosi never discusses this possibility. He needs Williams, crouched just yards from Oswald, to have heard the three shots he's proposing. And so he uses the movement of Kennedy's hand to brush back his hair, seen at frame 133 of the Zapruder film, and described by Williams and his co-workers on the fifth floor as the last movement they saw Kennedy make before the first shot, to suggest the shot rang out as early as frame 160. This conveniently overlooks that Williams and his co-workers were watching the motorcade from just below the sniper's nest, and that an oak tree would have blocked their view of Kennedy from frames 170 to 210 of the Zapruder

film (Testimony of Lyndal Shaneyfelt, 5H138-165), and that they therefore couldn't have seen Kennedy wave to the crowd at his right, starting around frame 175, cited by those closer to Kennedy as his last movement before the first shot (Testimony of Kenneth O'Donnell, 7H440-457, Testimony of Abraham Zapruder, 7H569-576 among others). Bugliosi's use of Williams to describe a shot he probably did not hear is **UNFAIR**.

- Bugliosi then presents **Virgie Rackley** as a witness to the first shot's impact. He uses her Warren Commission testimony (where she testified under her newly acquired name of Mrs. Donald Baker) to assert that a bullet missed Kennedy and hit the pavement of Elm Street behind the limousine. But here, once again, Bugliosi's treatment of his witness is...amiss. Bugliosi conceals from his readers that there is reason to doubt Rackley saw the bullet hit behind the limousine, as the earliest FBI report on Rackley, based on an interview conducted on the Sunday after the shooting, reflects *"after the first shot she saw something bounce from the roadway in front of the Presidential automobile and now presumes it was a bullet bouncing off the pavement."* (CD5, p66-67) Yes, the FBI claimed she originally said the bullet bounced in front of the limousine, and not behind.
- This is an important difference. While Bugliosi concedes that Baker thought the first sound she heard was *"a firecracker thrown by some boys who are fixing to get in a lot of trouble"* he fails to tell his readers that Baker's imaginary boys were standing *"close to the underpass"* or *"near the signs"*, and that this signifies that the firecracker or "sparks" she saw on the street were not indicative of a missed shot fired from behind, but from in front. He also conceals that Mrs. Baker was standing in front of the sniper's nest in the school book depository at the time of the shots and that she nevertheless testified that the explosion she heard *"sounded like it was coming from—there was a railroad track...so I guess it would be by the underpass."* (7H507-515) The underpass, was of course, in front of the limousine at the time of the shooting, and in the same direction from Baker as the "grassy knoll" believed by many to be the source of at least one of the shots.
- Even if one should grant that the FBI report was incorrect about the future Mrs. Baker's early impression of the presumed bullet impact, and even if one should grant that she was confused by echoes and had thereby misidentified the source of all the shots, there remains a significant problem with Bugliosi's use of her testimony to sell that the first shot missed circa frame 160 of the Zapruder film. He seems to be aware of this problem. On page 471, while discussing the first shot, Bugliosi asserts that Rackley told the FBI the first shot rang out *"immediately"* after the car drove past her location in front of the school book depository. But a close look at the FBI report cited by Bugliosi (CD5 p.66-67) shows it actually reads *"almost immediately."* Even worse, in Bugliosi's source notes for his narrative of the shots, Bugliosi cites Warren Commission Exhibit CE 354 as support for his use of Rackley. CE 354 is a photograph of Dealey Plaza, the site of the shooting, with notations by various witnesses, including Miss Rackley/ Mrs. Baker. Baker's circled numeral 2, recording her testimony as to the location of the firecracker or "sparks" she saw hit the street, is, clearly, 70 feet or more further down the street than Kennedy at the time of Bugliosi's proposed first shot. It is, in fact, almost exactly at the location of Kennedy at the time of Bugliosi's proposed second shot. While one might muse that Rackley/Baker was simply mistaken about this location, a close look at CE 354 shows that her mark of a circled numeral 1, where she was standing during the shots, is three times as far from her circled numeral 2, signifying the location of the firecracker or sparks, than from the location of the limousine at Bugliosi's proposed first shot. It seems hard to believe Mrs. Baker would testify that these sparks were over 100 feet away from her, if in fact they were no further than 35. (CE 354 can be viewed in Appendix Two of this essay). Bugliosi's use of Baker to describe a missed shot around frame 160, without telling his readers she thought the shot was

fired from in front of the limousine, and at a much later time, is undoubtedly **SUSPICIOUS**.

Should the reader think my dissecting the statements and testimony of these witnesses, and revealing that Bugliosi has concealed evidence that tends to contradict his version of events, is itself unfair, or simply "nit-picking," the reader should consider that Bugliosi himself asserts that a non-fiction writer has a responsibility to alert his readers to evidence that runs counter to his narrative. In the Introduction to *Reclaiming History*, while explaining why he believes his massive book was necessary, Bugliosi attacks previous Warren Commission defenders Jim Moore and Gerald Posner for leaving important information out of their arguments. He rightly argues that Posner, whose book, *Case Closed*, has quite a following among Bugliosi's readers, cherry-picked the testimony of certain witnesses, and that this resulted in a "*distortion and misrepresentation*" of the evidence. He asserts then that if only Posner "*had more credibility, the enormous conspiracy community would not have had the ammunition that they have used against him.*"

This leads Bugliosi to draw a line in the sand: "*I can assure conspiracy theorists who have very effectively savaged Posner in their books that they're going to have a much, much more difficult time with me. As a trial lawyer in front of a jury and an author of true-crime books, credibility has always meant everything to me. My only master and my only mistress are the facts and objectivity. I have no others...I will not knowingly omit or distort anything. However, with literally millions of pages of documents on this case, there are undoubtedly references in some of them that conspiracy theorists feel are supportive of a particular point of theirs, but that I simply never came across.*" In the 4-30-07 interview promoting his book, and in the speeches online from his publicity tour, Bugliosi expands upon this theme. He says that no one is "*gonna be able to say 'Oh, he included this paragraph from this letter but he conveniently neglected to put in the second paragraph which completely changes the meaning of the first paragraph.'* They're not gonna be able to do that because I don't do that. That's not my style...*If there's any weakness in a position that I've taken, if there's any argument, I state it, and then I knock it down. But I don't ignore it, and I don't distort it.*" Sounds reasonable to me.

- Next up for Bugliosi is Secret Service agent **Paul Landis**. He uses Landis' statements to suggest the first shot came from behind the limousine. Later, on page 468, he uses Landis' statements to suggest this shot rang out when the motorcade had just turned onto Elm, and that this first shot missed. To this end Bugliosi quotes Landis as follows: "*the President's car and the Follow-up car had just completed their turns and both were straightening out. At this moment I heard what sounded like the report of a high-powered rifle from behind me, over my right shoulder.*" But let's read the next lines of Landis' statement to see what else he has to say: "*When I heard the sound there was no question in my mind what it was. My first glance was at the President, as I was practically looking in his direction anyway. I saw him moving in a manner which I thought was to look in the direction of the sound. I did not realize that President Kennedy had been shot at this point.*" (18H751-757) Landis could recall but two shots, the first one just described that made the President move and that he later concluded hit the President. This is not the first shot described by Bugliosi, after which Kennedy waved happily to the crowd at his right. The second shot heard by Landis exploded the President's skull. Bugliosi fails to explain how Landis, once alerted to an assassination attempt by what Bugliosi proposes was an early missed shot, could have failed to notice that Kennedy continued waving after this shot, and could have failed to notice one of the two subsequent shots to strike his President. His using Landis to suggest the first shot missed is therefore misleading and **UNFAIR**.
- Bugliosi then describes the actions of Secret Service Agent **Rufus Youngblood**, Vice-President Johnson's bodyguard. He has Youngblood hear the first shot, notice "*unnatural movements*" in the President's follow-up car, and then move to protect Vice-President Johnson. There are real problems with Bugliosi's using Youngblood's testimony to describe a shot as early as frame 160,

however. One problem with this is that the Vice-President's car was just turning onto Elm at the moment of Bugliosi's first shot, and that Youngblood, in the Warren Commission testimony cited by Bugliosi, described the moment of the first shot as follows: *"Well, the crowd had begun to diminish; looking ahead and to the right the crowd became spotty. I mean it wasn't continuous at all like it had been. As we were beginning to go down this incline, all of a sudden there was an explosive noise."* This undoubtedly suggests the shot came after they'd completed their turn and were heading down Elm. (The location of Johnson's Lincoln at frame 160 can be observed in Appendix Three of this essay). Even more telling, during Youngblood's testimony, counsel Arlen Specter asked him to draw an "A" on Exhibit 354 to mark the location of the Vice-Presidential car at the moment of the first shot. (2H144-155) This is the same exhibit cited by Bugliosi in his discussion of Rackley. Not surprisingly, Youngblood's mark is well down Elm street, possibly even further than the vice-president's car at the time of Bugliosi's second shot. (CE 354 can be viewed in Appendix Two of this essay).

- Youngblood's description of the first shot's aftermath is also a problem for Bugliosi: *"I quickly observed unnatural movement of crowds, like ducking or scattering, and quick movements in the Presidential follow-up car."* The Zapruder film shows no "unnatural movements" in the President's follow-up car for several seconds after Bugliosi's proposed first shot. It is also problematic that the men making these "unnatural movements" would almost universally conclude that the first shot that got their attention had in fact struck the President. Youngblood's testimony, therefore, is not only a clear indication the first shot was fired after Bugliosi's proposed time for this shot, but that the first shot struck Kennedy. Bugliosi's use of Youngblood to describe a first shot miss at frame 160 of the Zapruder film is therefore **SUSPICIOUS**.
- Bugliosi then describes the actions of **Governor Connally**, who has come to be something of a star witness for the first shot miss with Bugliosi's supporters, even though he never once proposed such a thing. Bugliosi has Governor Connally hear the first shot and turn to his right, realize what is happening, and blurt out *"Oh, no, no, no!"* Now, this is just strange. Connally testified that he yelled out after he was shot, and not before. On his endnotes Bugliosi acknowledges his disregard for Connally's testimony and makes the argument that the testimony of Mrs. Connally, who thought her husband yelled out before he was shot, and Mrs. Kennedy, who said she turned to look at Connally when she heard him yell out, and even the Zapruder film, which shows Mrs. Kennedy turn to her right before Connally appears to have been hit, confirm that Connally yelled out before he was shot, and not after.
- Bugliosi disregards common sense in the process. A close look at the Zapruder film, which Bugliosi uses to defend this strange conclusion, will convince most anyone with a notion of how humans appear when talking that Connally yells *"Oh, no, no, no!"* around frame Z-240, after Bugliosi's proposed second shot. While this is readily apparent, in 1987 researcher Martin Shackelford contacted a deaf couple to watch the film, and see what they could see. They reported that Connally yells out *"No, no, no, no!"* between frames 242 and 250, and that he immediately follows this with *"My God, they're going to kill us all!"* As Shackelford's article on the deaf couple's translation is featured on the website of Marquette University professor John McAdams, Google's top-ranked assassination-related website, and as this website is pretty much required reading for single-assassin theorists, a la Bugliosi, it is hard to believe that Bugliosi would be unaware of the deaf couple's comments.
- But this is not the only manner in which Bugliosi distorts Connally's testimony. When describing Connally's first thoughts after hearing this first shot, he writes: *"Connally knows it isn't a firecracker or a blowout or anything else. It's a rifle shot."* The source notes for this passage reflect that this assertion can be found in Connally's testimony either before the Warren Commission, or in his subsequent testimony before the House Select Committee on

Assassinations (the HSCA). Well, this is pretty slippery. Connally's discussion of a rifle shot comes from his HSCA testimony. His original testimony to the Warren Commission, which Bugliosi chose not to reveal, however, was more specific. He testified: *"the thought immediately passed through my mind that there were either two or three people involved or more in this or someone was shooting with an automatic rifle."* Bugliosi, apparently, has no interest in telling his readers that Connally, a former Secretary of the Navy, thought the first shot sounded like a burst of bullets from an automatic weapon. While one can see how someone like Oliver Stone--a dramatist--would cherry-pick parts from the various statements and testimony of a witness to help him present his narrative, Bugliosi, through his publicity blitz and writings, has promised us something far more respectful of the historical record. And has failed to deliver.

- It is just not reasonable to argue that Connally's testimony supports the first shot miss proposed by Bugliosi. On page 468 of *Reclaiming History*, Bugliosi argues that Connally's testifying to have heard a shot when the limo had *"just made the turn"* indicates the shot was fired before frame 166 of the Zapruder film. This is unbelievably deceptive. Here's what Connally actually said: *"We had--we had gone, I guess, 150 feet, maybe 200 feet, I don't recall how far it was, heading down to get on the freeway, the Stemmons Freeway, to go out to the hall where we were going to have lunch and, as I say, the crowds had begun to thin, and we could--I was anticipating that we were going to be at the hall in approximately 5 minutes from the time we turned on Elm Street. We had just made the turn, well, when I heard what I thought was a shot."* 150-200 feet down Elm is 35-85 feet further down the street than the limousine was at frame 160 of the Zapruder film, and is, in fact, more in line with the limo's location at frame 224, the time of Bugliosi's second shot.
- Should Bugliosi have ignored this testimony because he believed Connally was simply bad at judging distances, he should have looked for other evidence provided by the Commission, which confirmed or conflicted with Connally's appraisal of this distance. He wouldn't have had to look far. On page 133 of Connally's Warren Commission testimony counsel Arlen Specter hands the Governor an overhead photograph of Dealey Plaza and asks him to mark where he was *"at the time the shooting first started."* The Governor states *"I would say it would be about where this truck is here. It looks like a truck. I would say about in that neighborhood."* He then marks the photo. This marked photo was placed into evidence as Commission Exhibit 699. (4H129-146)) When one compares this photo to the surveyor's plat of Dealey Plaza, moreover, one can see that the area marked by Connally is nowhere near where Bugliosi holds Connally was riding when he heard the first shot, and that it is, in fact, almost exactly where Connally was at the moment of Bugliosi's second shot. Bugliosi, who, we should repeat, sub-titles the section of his book containing the re-enactment and discussion of the shots *"Matters of Fact--What Happened"* fails to tell his readers here that Connally not only believed the first shot did not miss, but that it rang out seconds after the moment Bugliosi claims it missed. (CE 699 can be seen in Appendix Four of this essay.) Bugliosi's use of Connally's statements and testimony is therefore **SUSPICIOUS**.
- It also quite revealing about his method of operation, and his apparent disregard for consistency. For while Bugliosi uses Connally's testimony at this point of his book to sell that there was a first shot around frame 160, and that it missed, he later dismisses the relevance of Connally's testimony altogether. On page 480, to counter Connally's claim that he and Kennedy were not hit by the same bullet, he writes that Connally would be *"perhaps one of the least likely persons in the world who would know things such as this,"* as he was shot himself, and in a state of shock. This is to ignore that Connally's impression they were hit by separate bullets came not from his recollection of the shot which hit him, but from his immediate impression that the first shot--which Bugliosi holds was fired 3.5 seconds earlier--struck Kennedy, coupled

with his wife's recollection of seeing Kennedy react to the first shot, coupled with his doctor's impression that the shot striking him had not struck Kennedy. Bugliosi then goes on to explain why Connally's statements on the shooting should not be seriously considered. On page 481, Bugliosi concludes: *"The only thing that rings true to me about the governor's reflections on what was happening around the time he was hit is not when he tries to be precise, but when he said things like this in his 1978 testimony before the HSCA: 'When I was hit, or shortly before I was hit--no, I guess it was after I was hit...' All of his hesitation and confusion is more in keeping with what I would expect from a witness who had sustained the kind of injuries Connally did."* Seeing as Connally's testimony that he turned to the right as a response to the first shot is the cornerstone upon which Bugliosi's case for a first shot miss has been built, his subsequent attack on Connally's credibility, to counter Connally's fervent belief that the first shot hit Kennedy, is a bit bizarre. While Bugliosi might try to lawyer his way out of this by claiming that Connally's confusion "around the time he was hit" began just after the first shot miss, this seems rather arbitrary, and avoids the uncomfortable fact that Connally, when asked to mark his impression of the limo's location at the time of the first shot--an impression created before he'd been hit--marked CE 699 at a point much further down the road than the limo's location at the moment of Bugliosi's missed shot.

- Bugliosi then moves on to the women of the limousine. He has First Lady **Jacqueline Kennedy** turn to her right when she hears the Governor yell "Oh, no, no, no!". As her testimony saying as much was cited by Bugliosi as a reason to disregard Connally's testimony, her presence here is no surprise. But one wonders why he has given her clearly confused testimony so much weight, at the expense of the far-more consistent Connally. Perhaps he realized that by having Mrs. Kennedy turn to the Governor before he's shot, he could explain her behavior in the Zapruder film, where she looks to her right, at both the Governor and at the President, nearly two seconds before Bugliosi proposes they were shot. The problem is that Mrs. Kennedy's testimony, as disjointed as it is, is fairly clear on one point: Governor Connally was already hit when she looked at him. She testified: *"the one that made me turn around was Governor Connally yelling...Governor Connally screamed like a stuck pig...I heard Governor Connally yelling and that made me turn around."* (5H178-181, while the "stuck pig" reference was removed from the transcript published by the Warren Commission, it was found in the original transcript by researcher Harold Weisberg, and is discussed in books purportedly read by Bugliosi). Since Mrs. Kennedy recalled but two shots, one causing Governor Connally to scream, and the fatal blow to her husband, Bugliosi's using her to prop up a first shot miss long before Governor Connally screamed is once again bizarre, and suggests he thinks she somehow blocked a second shot--which he proposes struck both Kennedy and Connally--completely out of her mind. This is an **UNFAIR** use of her testimony.
- Bugliosi then has **Nellie Connally**, *"startled by the loud frightening noise that emanates from somewhere to her right,"* turn to look in this direction. He stops it right there, and in the process, leaves something out. A big something. Her Warren Commission testimony, which Bugliosi cites, reads: *"I heard a noise...I turned over my right shoulder and looked back, and saw the President as he had both hands at his neck"* (4H146-149). In subsequent interviews, Mrs. Connally would repeatedly assert that Kennedy was hit by this first shot. Why, if Bugliosi trusts her testimony that her husband yelled out "Oh, no, no, no!" just before he was shot--when she wasn't even focusing on her husband at the time--does he refuse to believe she saw Kennedy reacting to a shot when she claimed to be looking right at him?
- On page 481, Bugliosi finally gets around to offering his reasons for rejecting Nellie Connally's consistent claim that she saw Kennedy, sitting but 3 feet away from her, react to the first shot. In one of the most bizarre and deceptive arguments in a book filled with bizarre and deceptive

arguments, he asserts that we know Nellie Connally was confused because *"In her Warren Commission testimony, she testified that immediately after hearing the first shot, she 'looked back and saw the president as he had both hands at his neck.' We know from the Zapruder film, of course, that Kennedy showed no visible reaction to the first shot around Z160, so we know Mrs. Connally was wrong."* Well, I'll be. Talk of your circular reasoning. Bugliosi claims we know a shot was fired at frame 160 of the Zapruder film, in large part because Governor Connally testified to turning to his right just after the first shot. As President Kennedy was clearly not hit at this time, however, Bugliosi proposes that this first shot must have missed. This makes Governor Connally and his fervent belief that the first shot hit Kennedy an obstacle. No problem, says Bugliosi, Governor Connally was a gunshot wound victim, and his recollections of the moments just before and after he was shot are an understandable blur. Never mind that this undercuts the value of Connally's testimony, the very testimony upon which Bugliosi's first shot miss theory has been built. Besides, says Bugliosi, *"Governor Connally's conclusion that the president was hit by the first shot is based solely, it seems, on the recollection of his wife, Nellie."* And why can't we trust Nellie's recollection? Because her recollection conflicts with the first shot's being fired at frame 160, a precise time divined by Bugliosi from her "confused" husband's testimony! Apparently, we are to disregard the statements and testimony of any witness whose statements and testimony conflict with Bugliosi's proposed first shot miss, an event so far unsupported by the full statements and testimony of every witness he's provided.

- But if that wasn't bad enough, on page 481 Bugliosi offers us a second reason to distrust Nellie Connally's assertion that the first shot struck the President. His second reason is that *"She also said that after the first shot, she recalls her husband exclaiming, 'Oh, no, no, no.' But he testified, 'When I was hit' (which he said was by the second shot) is when 'I said 'Oh, no, no, no.'"* Umm, wow. Did Bugliosi really forget that he'd previously argued that she was right when she said her husband yelled out "Oh, no, no, no!" after the first shot, and that he'd used her statement, at that time, to discredit her husband? He can't have it both ways. He can't say her husband is wrong because she disagrees with him and then turn around and say we can't trust her because he disagrees with her. Bugliosi ends his attack on Mrs. Connally's credibility with a bit of unintentional irony: *"All of this is perfectly understandable confusion."* Yes, I'm afraid it is. Let's recall here the words of Bryan Burrough in the New York Times: *"It's in the arguing that Bugliosi, as a former prosecutor, truly shines."* Bugliosi's treatment of Nellie Connally's testimony is clearly **SUSPICIOUS**.

So now we've looked at the statements and testimony of seven witnesses offered us by Bugliosi. These witnesses are purportedly describing a missed shot fired around frame 160 of the Zapruder film. As three of these witnesses could recall but two bursts of gunfire, using their description of the first shot they heard to describe the first of three well-spaced shots is misleading and unfair. Bugliosi's treatment of the other four witnesses is suspicious. The statements and testimony of all four indicate the first shot was fired at a point later than the first shot proposed by Bugliosi, or that the first shot struck Kennedy, or both. While Bugliosi eventually discusses the Connallys' belief that the first shot struck Kennedy, he never discusses Exhibits 354 and 699, which demonstrate that Virgie Baker, Rufus Youngblood and Governor Connally all felt the first shot was fired after the first shot proposed by Bugliosi. I believe it's fair from this to conclude that Bugliosi's narrative of the shots, and subsequent discussion of the shots, is unreliable, and revealing of his bias. As this is the central event of his massive book, I believe it is also fair to conclude from this that Bugliosi just can not be trusted to tell his readers the information they need to know to make informed decisions about the evidence presented. One already convinced of this, and pressed for time, may wish to proceed to Part 4 of this essay.

Should one remain skeptical on this point, however, one should feel free to continue. But I warn you,

Bugliosi's use of the witnesses doesn't get much better.

- The rest of Bugliosi's first shot witnesses are all used to demonstrate that the shots were fired from the sixth floor sniper's nest of the Book Depository, Oswald's place of employment. First, Bugliosi describes motorcycle officer **Marrion Baker's** response to this shot, of his seeing pigeons fly through the air from the roof of the depository, and of his racing up Houston Street to see what's going on. He fails to mention that Baker was asked by Warren Commission counsel David Belin to return to the scene, to figure out exactly where he was on Houston Street when he heard the first shot, and that the two men then measured the distance of this location from the nearest street. Baker later testified "*we approximated it was 60 to 80 feet there, north of the north curbline of Main and Houston*" (3H242-270). As you by now probably have guessed, a look at films of the motorcade--in this case the film of Robert Hughes-- demonstrates that Baker did not reach this location until a few seconds after Bugliosi's proposed first shot.
- While it's not clear that Bugliosi knows this, it's fairly clear he should. In the Acknowledgements section of his book, Bugliosi claims "no one helped me as much as Dale Myers, the Emmy Award-winning computer animation specialist." He then admits "Dale helped me in the writing of several sections of Book One." The narrative we're discussing is, of course, the central event in Book One. Concurrent with his work with Bugliosi, Myers conducted a detailed study of the assassination films, which he modestly entitled "Epipolar Geometric Analysis of Amateur Films Related to Acoustics Evidence in the John F. Kennedy Assassination." This study was released within days of Bugliosi's book. In this study, Myers includes an illustration of Baker's position at frame 150 of the Zapruder film. In this illustration, he places Baker approximately 36 feet north of the Main Street curbline. As Myers also asserted that Baker had traveled 19.5 feet over the previous 35 frames of the Hughes film, which was filmed at the same speed as the Zapruder film, it follows that, even in Myers' opinion, Baker was approximately 42 feet north of Main Street at Z-160, and would not have reached 60 feet north of Main Street until approximately frame 192 of the Zapruder film (assuming, of course, that Baker maintained his speed). If Bugliosi read Baker's testimony and failed to ask Myers at what point Baker reached 60 feet north of the curbline, his use of Baker to suggest there was a shot as early as frame 160 is indicative of nothing more than apathetic research. If, however, he asked Myers about this and was told that Baker didn't reach 60 feet north of the curbline until well after frame 160, then he is guilty of keeping important information from his readers. We'll split the difference and call it an **UNFAIR** use of Baker's testimony.
- Bugliosi then calls on **James Worrell**, standing in front of the book depository. He writes that when Worrell "*hears the first shot, Worrell throws his head back, looks straight up and sees six inches of gun barrel*" (2H190-201). Bugliosi, not surprisingly, fails to mention that Worrell testified to hearing four shots, at least one of which could not have been fired from the sniper's nest. I haven't found a single mention of Worrell's hearing four shots anywhere in Bugliosi's massive book. Using a man who heard four shots to describe one of three shots, without any assurance this was the same shot, is **UNFAIR**.
- He then presents young **Amos Euins**, standing by the fountain across the street from the depository, to confirm Worrell's sighting of a gun in the window. Here, too, he misleads. Euins, as Worrell, testified to hearing four shots (2H201-210). While some say Euins' testimony is untrustworthy, as he only described three shots in his earliest statement, they miss that he, as Connally, said that the gun "*sounded like an automatic rifle the way he was shooting*" (16H963), and that he told the FBI within a few weeks of the shooting that he observed the sniper fire "*what he believes to have been a fourth shot*" (CD205, p. i). Once again, I've searched through Reclaiming History and haven't found a single mention of Euins' hearing four shots. Using Euins testimony to imply three well-spaced shots were fired is **UNFAIR**.

- This leads us to the Warren Commission's star witness, the only man to claim he saw Oswald fire a shot at the President, **Howard Brennan**. Bugliosi's narrative has Brennan, sitting on a wall near Euins, hear the first shot and look up to the sniper's nest, where he sees a young man he'd seen moments before, only now armed with a rifle. With this, Bugliosi misleads once again. You see, Brennan, much as Mrs. Kennedy, could only testify to hearing two shots, one that got his attention, and then a final shot. He could not swear to hearing a shot between these shots. Brennan testified: *"I don't know what made me think that there was firecrackers throwed out of the book store unless I did hear the second shot, because I positively thought the first shot was a backfire, and subconsciously I must have heard a second shot but I do not recall it. I could not swear to it."* (3H140-161). This confession was consistent with a much earlier description of the shots given by Brennan to the FBI, which reads: *"He said he does not distinctly remember a second shot but he remembers "more than one noise" as if someone was shooting fire crackers, and consequently he believes there must have been a second shot before he looked in the direction of the Texas School Book Depository Building."* (CD5 p12-14) Thus, Brennan felt he'd heard two shots before looking up to the sniper's nest, and Bugliosi's having him look up after the first is improper.
- It's also quite illogical. If Bugliosi had endeavored to stay consistent with Brennan's testimony, he'd have written that Brennan looked up after the second shot. If he'd argued from common sense, and had reasoned that someone alerted to a loud noise would be likely to recall a similar noise moments later, he would also have portrayed him looking up after the second shot. Bugliosi is pushing there were three relatively even-spaced shots. He cannot actually be proposing that Brennan's "more than one noise" sounding like "someone was shooting fire crackers" was the first shot, and then have Brennan, a key witness, and a man supposedly blessed with superior observation skills, just completely fail to notice a second shot.
- Or maybe he can. It seems not even Brennan can avoid Bugliosi's abuse. Bugliosi concludes his narrative of the first shot by having Brennan look up and see a sniper in the window. Bugliosi exhales: *"Brennan sees him from the waist up with awful clarity, the rifle braced against his right shoulder as he leans against the left window jamb. The gunman's motions are deliberate and without panic. After a few seconds, he fires again."* The shot described by Bugliosi is the shot Brennan believed to be the third shot, not the second shot, and was, according to Brennan, most certainly the last shot fired from the sniper's nest. So why does Bugliosi present this as the second shot in his narrative? Is he trying to shore up the illusion that Brennan heard the first of a series of three well-spaced shots? Bugliosi's having Brennan look to the sniper's nest after the first shot is undoubtedly **SUSPICIOUS**.

Let's recap: Bugliosi has so far presented 11 witnesses to describe the first of three shots, a shot that he asserts as fact was fired circa frame 160 of the Zapruder film, and did not hit President Kennedy. Of these 11 witnesses, 4 could only swear to knowledge of two bursts of gunfire, suggesting the first shot they heard was not this shot, but Bugliosi's proposed second shot. Of the remaining 7, another 2 said they heard 4 shots, suggesting the possibility this was the second shot they'd heard. Of the remaining 5, 4 of them, in the Warren Commission testimony Bugliosi uses as his primary source, described either the location of the limousine at the moment of the first shot, or their own location in the motorcade at the time of the first shot--and in all 4 cases their testimony suggests the first shot rang out several seconds after Bugliosi's proposed first shot. This leaves but 1 witness whose testimony may support Bugliosi's assertion that the first shot rang out circa frame 160 of the Zapruder film and missed, and she, Nellie Connally, sitting but a few feet away from the President in the limousine, felt absolutely certain Kennedy was hit by the first shot.

So why, if the first shot miss proposed by Bugliosi is a "fact," is he having such trouble finding anyone to support his claim? On page 468, he lists a number of witnesses for this shot. Beyond the witnesses

already discussed, he adds Lady Bird Johnson, Barbara Rowland, Kenneth O'Donnell, and Geneva Hine.

- As support that the first shot was fired as early as frame 160 of the Zapruder film, when the presidential limousine has just completed its turn onto Elm Street, Bugliosi quotes **Lady Bird Johnson**, who was riding in the motorcade two cars behind Kennedy, as follows: "*We were rounding a curve...and suddenly there was a shot.*" This is, I believe, a deliberate distortion of the evidence. The full sentence which he cannibalizes is actually "*Then almost at the edge of town, on our way to the Trade Mart where we were going to have the luncheon, we were rounding a curve, going down a hill, and suddenly there was a sharp loud report--a shot.*" She then continued: "*It seemed to me to come from the right, above my shoulder, from a building. Then a moment and then two more shots in rapid succession.*" (5H564-567) The words he replaced with his "..." were "*going down a hill.*" "*Going down a hill,*" not surprisingly, implies the car had completed its turn, and was significantly past its location at frame 160 of the Zapruder film. It is generally accepted that when someone omits (or adds) a word or words to a quote that changes its meaning, they can be accused of willful deception. Bugliosi himself has argued as much. I believe this is such an example.
- Also telling is that Mrs. Johnson said the shot came from the right, above her shoulder. If the shot rang out at frame 160, when the Vice-Presidential car was just turning onto Elm, as Bugliosi asserts, this would suggest the shot came from one of the buildings on the east side of Houston, the County Records Building or the Dal-Tex Building. (The limousine's location at frame 160 can be viewed in Appendix Three of this essay). Since Bugliosi assumes this shot came from the sniper's nest in the school book depository, directly in front of the car as it made its turn, it follows then that this shot must have been fired sometime after frame 160. Mrs. Johnson's recollection that the last two shots came in "rapid succession" is also telling. As discussed earlier, and as demonstrated in Appendix One, any indication that the last two shots were closer together than the first two is an indication that the first shot did not miss. Bugliosi's sculpting of Mrs. Johnson's words is undoubtedly **SUSPICIOUS**.
- Bugliosi also cites **Barbara Rowland's** vague testimony that "*as they turned the corner we heard a shot*" as support the shot rang out as early as he claims. He neglects to reveal that Mrs. Rowland had signed a statement on the day of the shooting that was more specific, and claimed that the limousine had "*turned left onto Elm Street and started down towards the underpass*" when the first shot rang out. (24H224) He fails to reveal as well that, when asked about the three shots, Mrs. Rowland testified "*the second and third were closer than the first and second.*" (6H177-191). This, of course, is in keeping with the testimony of Bonnie Ray Williams and the statement of Mrs. Johnson, and suggests the first shot did not miss. It seems more than a coincidence then that even a cursory study of the Zapruder film and the eyewitness testimony reveals that having the last two shots closer together than the first two is inconsistent with the first shot's having missed, and that Bugliosi never discusses this with his readers. **UNFAIR**.
- Bugliosi's use of **Kenneth O'Donnell** to suggest the first shot was fired as early as frame 160 is even more askew. According to Bugliosi, O'Donnell, a Kennedy aide who'd been riding in the car just behind the President, "*testified that the president's car was 'just about (through) turning (and had started) to step up a little bit' when the first shot rang out.*" The words in parentheses are supplied by Bugliosi, and grossly distort O'Donnell's meaning. The actual transcript reads: "*I would presume they were just about turning to step up the speed a little bit, because there would be no crowds from there.*" O'Donnell had garbled his sentence, and had used the word "turning" instead of "beginning." Far from implying that the shot rang out as the car turned onto Elm, moreover, as suggested by Bugliosi's "translation," O'Donnell's words, when read in context, suggest the first shot was fired as the limousine left the crowds behind. In support of

this interpretation, it should be noted that O'Donnell further testified that just before the first shot rang out, Kennedy *"was waving. We had just left the mass of crowds. But as we turned on the grass plot, there were four or five people there, and I believe he waved to them."* This confirms that O'Donnell felt the first shot was fired after Kennedy waved to the crowd, and as the limousine drew parallel to the grassy knoll. This is long after frame 160, and is far more in sync with the time of Bugliosi's second shot. While someone might counter that O'Donnell testified that the first shot missed and that it therefore must have been fired around frame 160, well before the moment Kennedy was hit, this is, in fact, the exact opposite of how O'Donnell testified. Instead, he said, that the first two shots came *"almost simultaneously."* When asked which of these two hit Kennedy, furthermore, he said: *"It was not the third shot. Whether it was the first or second, I would not know"* and continued *"If I had to pick one of the two, I think it might have been the second shot."* (7H440-457) This confirms that the first shot heard by others, which many thought to be a firecracker, was interpreted by O'Donnell to be two separate nearly simultaneous shots, one of which hit Kennedy while he was waving. This is clear to anyone reading his testimony. And yet Bugliosi twists O'Donnell's words to support that a first shot was fired a second or two before Kennedy waved to the crowd, and missed, and that a second shot hit Kennedy 3 1/2 seconds later. This is, you guessed it, **SUSPICIOUS**.

- Bugliosi's next and final witness for his proposed first shot miss, is **Geneva Hine**, a secretary working in the school book depository, who watched the motorcade from a second floor window. Bugliosi reports that she *"testified the presidential limousine had just 'turned the corner' when she heard the shot."* She, in fact, testified: *"I saw him turn the corner and after he turned the corner I looked and I saw the next car coming. Just at the instant I saw the next car coming up was when I heard the shots."* (6H393-397) She said "shots", as in more than one. This suggests that she, as O'Donnell, interpreted the first "firecracker" as more than one shot. While Bugliosi, as others before him, use Hine's testimony to suggest a first shot missed as early as frame 160 of the Zapruder film, he misses that, should the first shot have really rang out as the "next car"--the Secret Service back-up car--was "coming up" to the turn, as she appears to have testified, the first shot would have to have been fired seconds before frame 133 of the Zapruder film, when the limousine and back-up car are both on Elm. He also misses that the turn onto Elm was so long and winding that there is no way that Kennedy's limo could have completed its turn onto Elm before the "next car"--the Secret Service back-up car--could have entered the turn. From this it seems likely that the "next car" in her testimony is some anonymous car back in the pack, and is in fact the "next car" that she looked at and not the "next car" behind the limousine. Although Ms. Hine was interviewed by the FBI on 11-23-63, and then again on 3-18-64, the first time she mentioned looking out the window and seeing the motorcade was when she testified on 4-7-64, four and a half months after the shooting. That her quite possibly confused and/or misinterpreted recollection of the limousine's location at the time of the first shot is nevertheless the best evidence yet offered by Bugliosi for his proposed first shot miss is indeed shocking. While her exact words indicate she heard two or more shots at this time, and Bugliosi crops it to one "shot", he may have innocently assumed that when she said *"when I heard the shots"* she meant *"when I heard the shots (commence)."* We'll give him the benefit of the doubt on this one, then, and say his use of her testimony, while probably incorrect, is nevertheless **FAIR**.
- Bugliosi concludes this section with the ironic statement *"Many other witnesses gave essentially the same testimony."* Yes, they did--but only when one considers that the witnesses already cited by Bugliosi didn't testify to what he claims they testified. While there were indeed a few other witnesses who said they believed the first shot missed--Mary Woodward, James Chaney, and Glen Bennett come to mind--they were not called to testify before the Warren Commission, and the statements of all three of these examples crumble when one compares

their statements to the photographic record. As a result, the historical record reputed to be so "sacred" to Bugliosi--the sworn statements and testimony of witnesses before the Dallas Police, the FBI, and the Warren Commission--is almost unanimous in its suggestion that the first shot struck President Kennedy.

The first shot proposed by Bugliosi is a myth, as out of sync with the historical record as most anything dreamed up by conspiracy theorists.

This becomes even more clear when we look at Bugliosi's narrative for a second shot.

Bugliosi's Second Strike

- Bugliosi begins his narrative for the second shot with another "Bang"....and another minor misrepresentation of the evidence. He writes that *"The report is so loud inside the fifth floor of the Texas School Book Depository Building that the windows rattle, and loose plaster and dirt fall from the ceiling onto **Bonnie Ray Williams'** hair."* He cites as his source for this assertion Williams' Warren Commission testimony. But Williams, who originally said there was two shots, but then testified to hearing three, with the last two "real quick", does not specify which of these last two shots caused dirt to fall in his hair (3H161-184). Although an FBI report from 11-26-63 (CD5 p63) has Harold Norman stating that *"he stuck his head from the window and looked upward toward the roof but could see nothing because small particles of dirt were falling from above him"* neither Norman nor James Jarman, who were both crouched near Williams on the floor below the sniper's nest, testified to noticing the dirt until after the final shot. (3H186-198) (3H198-211).
- While this misrepresentation is admittedly a minor one, it nevertheless helps Bugliosi create the illusion that Williams was aware of a second shot, 3.5 seconds after what Bugliosi purported was the first shot. Williams, as we've seen, heard but two bursts of gunfire, one that got his attention--which Bugliosi has already asserted was the first shot--and a final burst of one or two shots (depending on whether one believes his early statements or his testimony) that Bugliosi presumes was the head shot. Williams' testimony is extremely problematic for Bugliosi and his assertion as fact that Oswald fired three well-spaced shots just over Williams' head. Bugliosi's treatment of Williams is therefore **SUSPICIOUS**.
- Bugliosi's first witness for the impact of this shot is **Charles Brehm**. He writes *"the car is very close to Charles Brehm and his son, maybe 20 feet away, so they can see the president's face very well when the shot rings out. The president stiffens perceptibly and his hands swoop toward his throat."* Bugliosi cites as his source for this passage an FBI report on Brehm a few days after the shooting. In this report, Brehm's recollections are described as follows: *"When the President's automobile was very close to him and he could see the President's face very well, the President was seated, but was leaning forward when he stiffened perceptibly, at the same instant what appeared to be a rifle shot sounded. According to Brehm, the President seemed to stiffen and come to a pause..."* (22H837-838) Bugliosi hides from his readers that this was Brehm's description of the first of three shots, not the second, and that Brehm had been interviewed a number of times on the day of the shooting, and had consistently reported that Kennedy was hit by the first shot. **SUSPICIOUS**.
- Bugliosi's second witness for the second shot's impact is Secret Service agent **Glen Bennett**, riding in the back seat of the President's back up car. Bennett, he writes *"is looking right at the president when the second shot hits him, he estimates 'about 4 inches down from the right shoulder.'" While Bennett did indeed report that the second shot struck Kennedy in the back, Bugliosi's use of Bennett is not without its problems. For one, Bennett places the wound "4 inches down from the right shoulder," which is inconsistent with Bugliosi's subsequent conclusion that the back wound was above the exit on Kennedy's throat. For two, in Bennett's*

original notes, published by the Warren Commission (24H541-542), he says that, upon looking at the President after the first shot, he saw "a shot that hit the boss" and that a "second shoot followed immediately and hit the right rear high of the boss's head". In his notes, he doesn't say he heard another "fire-cracker noise" when he saw the "shot that hit the boss". Bennett's awkward grammar then suggests the possibility he meant to say that, upon looking at the President after the first shot, he saw "that a shot had hit the President," and that a second shot hit Kennedy in the head. We just don't know. Even so, Bugliosi's use of Bennett's statement to support that the second shot hit Kennedy is not improper or deceiving.

- Should one think we found a witness to the shot's impact whose words were not improperly interpreted or presented by Bugliosi, however, one would be wrong. Bugliosi isn't through with Bennett: *"He's hit!" Bennett shouts, and reaches for the Colt AR-15 assault rifle on the seat, but agent George Hickey has already got it.*" This conceals that Bennett claimed to have yelled out *"He's hit"* after the third shot, which Bennett, much as Bonnie Ray Williams and Mrs. Johnson, claimed *"immediately"* followed the second shot. In the report by Bennett cited by Bugliosi, Bennett follows his description of the second shot as follows: *"A second shot followed immediately and hit the right rear high of the President's head. I immediately hollered 'he's hit' and reached for the AR-15 located on the floor of the rear seat"* (18H760). **SUSPICIOUS.**
- Bugliosi then describes the actions of agent **George Hickey**, sitting next to Bennett. He has Hickey beat Bennett to the rifle and spin *"toward the right rear, from where the shots appear to have come."* This is an amazing distortion of Hickey's statement, the bulk of which follows: *"Just prior to the shooting the Presidential car turned left at the intersection and started down an incline toward an underpass followed by 679x. After a very short distance I heard a loud report which sounded like a firecracker...I stood up and looked to my right and rear in an attempt to identify it. Nothing caught my attention except people shouting and cheering. A disturbance in 679X caused me to look forward to the President's car. Perhaps 2 or 3 seconds elapsed from the time I looked to the rear and then looked at the President. He was slumped forward and to his left, and was straightening up to an almost erect sitting position as I turned and looked. At the moment he was almost sitting erect I heard two reports which I thought were shots and that appeared to me completely different in sound from the first report and were in such rapid succession that there seemed to be practically no time element between them."* From this it's clear that Bugliosi has Hickey turning to his right after "shots" when he in fact said it was after the first shot. This disguises that Hickey did not hear a second shot until the time of the head shot, when he heard two shots grouped together. This in turn disguises that Hickey's accounting of the three shots leaves no room for Bugliosi's proposed first shot miss.
- Bugliosi also disguises, whether on accident or on purpose, that Hickey, as Bennett, felt quite sure he didn't reach for the AR-15 until after the last shot. His report asserts: *"At the end of the last report I reached to the bottom of the car and picked up the AR 15 rifle, cocked and loaded it, and turned to the rear. At this point the cars were passing under the over-pass and as a result we had left the scene of the shooting."* (18H761-764). While one might make the argument that Bugliosi was confused by Hickey's two separate turns to the rear and that he placed Hickey's turn to the rear with the rifle after the second shot by accident, this seems unlikely. On page 927 of *Reclaiming History*, to counter Howard Donahue's theory that Hickey accidentally shot Kennedy with the AR-15, Bugliosi quotes Hickey's report and argues that Hickey didn't even reach for the rifle until after all the shots had been fired. Once again, he can't have it both ways. **SUSPICIOUS.**

Bugliosi's decision to ignore the bulk of Hickey's report, which implies that Kennedy was hit by the first shot, and that, after a pause, two shots followed in "rapid succession," would seem to be more than a coincidence. The fact that that both Bennett and Hickey felt the last two shots were close together,

and that both men agreed that Hickey picked up the AR-15 after the third shot, is damaging to Bugliosi's argument that there was a first shot miss, followed 3.5 seconds later by a bullet striking both Kennedy and Connally, followed 4.9 seconds later by a final and fatal shot to Kennedy's cranium. If Bugliosi is correct, it makes little sense that the Secret Service would not know by the second shot what was going on. Is it a coincidence then that Bugliosi presents actions they insisted came after the third shot as a response to the second shot? If Bugliosi is correct, it also would seem strange that agents only yards from Kennedy would believe the last two shots came in "*rapid succession*." Is it a coincidence then that any and all references by Secret Service agents to the third shot's "immediately" following the second appear to have been filtered from Bugliosi's narrative, via his selective use of testimony?

- Bugliosi's motorcade of deception continues: "*Special Agent **Clint Hill** leaps off the running board of the follow-up car and dashes towards the president's limousine.*" He excludes, not surprisingly, that Hill testified to running for Kennedy after the first of the two shots he heard, a shot he believed struck the President. He also excludes that the second shot described by Hill was the shot striking Kennedy's skull and that it "*seemed to have some type of an echo.*" (2H132-144) This echo, of course, is consistent with Bennett's description of two shots "*immediately*" following another, and Hickey's two shots in "*rapid succession*." As a result, there's reason to believe that all three of these bodyguards heard a first shot that struck Kennedy, and then two more in rapid succession at the time of the head shot. If so, then, of course, none of them heard the missed first shot Bugliosi presents as a "fact". **UNFAIR.**
- Bugliosi then introduces into his mix n match version of history **Roy Kellerman**, the Secret Service agent riding in the front seat of the limousine. Kellerman, he asserts, "*believes he hears the president say 'My God, I am hit.'*" While Bugliosi is correct that Kellerman testified to this, and is correct for arguing in his endnotes that Kellerman was almost certainly mistaken, his use of Kellerman's incorrect recollection to describe a second shot without acknowledging that Kellerman testified that he heard these words after the first shot, is more than mistaken; it's deceptive. (2H61-112).
- Bugliosi then describes Kellerman's turning to his left and looking at Governor Connally. His source notes indicate that Kellerman turns between frames 268-270. But this event, seconds after what Bugliosi proposes was the second shot, was still seconds before the second shot described by Kellerman. In keeping with the statements of Bennett and Hickey, and consistent with the testimony of Hill, Kellerman described the last two shots as a "*flurry of shots*". This means that two (or more) shots impacted around Z-313, the moment of the head shot. Should one think Kellerman's words are too vague to come to this conclusion, Kellerman clarified his impression of the shots by marking the location of the limousine at the time of the shots on a photo, Commission Exhibit CE 347, in his testimony. (See Appendix Two). First, Kellerman marked his impression of the limousine's location at the time of the first shot with an "X." His "X", as one might suspect, is a good 30 feet further down the street from the limo's location at Bugliosi's first shot. While his "Y", marking the location of the limousine at the second shot, is difficult to distinguish on the Commission's exhibit, Kellerman's testimony about the location of the third shot is more than clear. After marking his "Y", Counsel Arlen Specter asked of Kellerman: "*Now, with respect to the time of the third shot, would your marking be any different from the 'Y' position?*" Kellerman answered: "*No. It would not.*" (2H61-112). **SUSPICIOUS.**
- Bugliosi now revisits **Governor Connally**. He has Connally yell out "*My God! They're going to kill us all!*" as a response to this shot. As discussed earlier, Connally testified to yelling this out just after he yelled out "*Oh, no, no, no!*" without a shot in-between. This is supported by the Zapruder film. Even so, Bugliosi is correct that Connally claimed to have yelled out "My God" after the second shot. Chalk one up. Sorta. (4H129-146) **FAIR.**
- Next up is **Nellie Connally**. Bugliosi has her pull her husband down in the seat after the second

shot. This assertion is in keeping with her testimony. Two in a row. (4H146-149) **FAIR**.

- But two in a row is as good as it gets. On page 41 in Bugliosi's narrative **Jackie Kennedy** turns to her husband, *"who has a strange quizzical look on his face."* This is deceptive. Bugliosi has already had Mrs. Kennedy turn to look towards Connally after the first shot. By listing Mrs. Kennedy's turning to her husband in a list of responses to the second shot, Bugliosi not only implies she heard a shot after the first shot miss he claims she heard, but that she recalled responding to one. She did not. She could recall but one shot after Governor Connally screamed, the fatal head shot. She testified *"suddenly Governor Connally was yelling, 'Oh, no, no, no' ...I was looking this way, to the left, and I heard these terrible noises. You know. And my husband never made any sound. My husband never made any sound. So I turned to the right. And all I remember is seeing my husband, he had this sort of quizzical look on his face, and his hand was up, it must have been his left hand. And just as I turned to look at him, I could see a piece of his skull and I remembered that it was flesh colored."* (5H178-181) Amazingly, Bugliosi has had Mrs. Kennedy hear a first shot miss even though having her hear this miss means she failed to hear or even notice the second shot he proposes struck both her husband and the Governor. **SUSPICIOUS**.
- The next witness offered up is **William Greer**, the driver of the limousine. Bugliosi's having Greer turn back to look at Kennedy after a second shot is consistent with his testimony. Bugliosi doesn't mention however, that Greer, as Kellerman, was asked to mark CE 347 to show the limo's location during the shots. Greer's "A", indicating the limo's location at the time of the first shot, is about 50 feet further down the road than the limo's location at Bugliosi's proposed first shot. (See Appendix Two). While Greer's "B" and "C" are hard to discern on CE 347, Greer did confuse everyone by testifying that *"The last two seemed to be just simultaneously, one behind the other, but I don't recollect just how much, how many seconds were between the two. I couldn't really say."* (2H112-132) If he'd heard two shots before he turned back to look at Kennedy—which he can be seen doing around frame 280 of the Zapruder film--and he heard the last two shots, including the head shot two seconds later, *"simultaneously,"* instead of the 4.9 seconds apart proposed by Bugliosi, shouldn't he have testified to hearing four shots, and not the three he said he'd heard? Greer's confusing statement that the last two shots rang out *"simultaneously,"* is, nevertheless, consistent with the statements of Bennett, Hickey, Hill, and Kellerman, and suggests that, yes indeed, the last two shots followed right after each other. **UNFAIR**.
- Bugliosi then returns to **Roy Kellerman**, and has Kellerman yell *"Let's get out of here. We're hit!"* as Greer turns back around to face forward. This is a fair use of his testimony, but is not counted as such because it is really a continuation of Kellerman's earlier description of the shot.
- Bugliosi's narrative then shifts back to **Rufus Youngblood**, the Secret Service agent riding in the front seat of the Vice-President's car. Bugliosi has Youngblood vault over the seat and sit on top of Vice-President Johnson as a response to this shot. He writes *"there is no doubt in Youngblood's mind what the sound is now--gunshots!"* He cites Youngblood's testimony and Johnson's statement to support his assertion that Youngblood vaulted onto Johnson at this time. Youngblood, however, testified that shortly after hearing the first shot, *"I turned around and hit the Vice President on the shoulder and hollered, get down, and then looked around again and saw more of this movement, and so I proceeded to go to the back seat and get on top of him. I then heard two more shots. But I would like to say this. I would not be positive that I was back on that back seat before the second shot. But the Vice President himself said I was."* (2H144-155). Youngblood was therefore unsure of when he jumped over the seat.
- This brings us to then Vice-President **Lyndon Johnson's** statement: *"The motorcade proceeded down Main Street and then turned right on Houston. It then turned into Elm, which is a block, I*

believe, beyond the intersection of Main and Houston. The crowd on Elm Street was smaller...After we had proceeded a short way down Elm Street, I heard a sharp report. The crowd at this point had become somewhat spotty. The Vice-Presidential car was then about three car lengths behind President Kennedy's car, with the Presidential followup car intervening. I was startled by the sharp report or explosion. but I had no time to speculate as to its origin because Agent Youngblood turned in a flash, immediately after the first explosion, hitting me on the shoulder, and shouted to all of us in the back seat to get down. I was pushed down by Agent Youngblood. Almost in the same moment in which he hit or pushed me, he vaulted over the back seat and sat on me. I was bent over under the weight of Agent Youngblood's body, toward Mrs. Johnson and Senator Yarborough. I remember attempting to turn my head to make sure that Mrs. Johnson had bent down. Both she and Senator Yarborough had crouched down at Agent Youngblood's command. At some time in this sequence of events. I heard other explosions.” (5H561-564).

- While Johnson's statement, written many months after the assassination, is vague about the exact timing of Youngblood's leap, an 11-23-63 letter written by Johnson to Secret Service Chief James Rowley, and subsequently published in newspapers, was more conclusive: "*Upon hearing the first shot, Mr. Youngblood instantly vaulted across the front seat of my car, pushed me to the floor and shielded my body with his own.*" Bugliosi is therefore wrong to cite Youngblood's testimony and Johnson's statement as support for his contention that Youngblood leaped into the back seat after the second shot. As a photo taken by James Altgens at Zapruder frame 255 shows Mrs. Johnson and Senator Yarborough still sitting up in the back seat of Johnson's limo, moreover (see Appendix Three) it seems likely that, in accordance with Altgens' testimony, only one shot had rang out by this time, and not the two proposed by Bugliosi. Adding strength to this assessment is that Johnson stated the limousine had proceeded "a short way" down Elm before the first shot rang out, when, at the time of Bugliosi's first shot, the Lincoln in which he was riding was just turning onto Elm. (See Appendix Three). Bugliosi's assertion that Youngblood covered Johnson after the second shot, but before the third shot, and that this time period covers frames 224 and 313 of the Zapruder film, is therefore without foundation. **UNFAIR.**
- At this point in his narrative, Bugliosi slips into the mind of **Abraham Zapruder**, watching the shooting through the viewfinder of his famous camera. Bugliosi writes "*The thought flashes in his mind, as he sees the President jerk and slump to his left against Jackie, that it's a joke.*" Bugliosi hides from his readers that, as with most of his other witnesses for his second shot, Zapruder felt this was the first shot. Although Zapruder, who could swear to hearing but two shots, may have simply missed hearing Bugliosi's first shot, his testimony suggests he felt he missed hearing a third shot, just after the head shot. When asked how many shots he heard, he testified: "*I thought I heard two, it could be three, because to my estimation I thought he was hit on the second—I really don't know...I heard the second—after the first shot—I saw him leaning over and after the second shot—it's possible after what I saw, you know, then I started yelling, 'They killed him, they killed him.'*" (7H569-576) It seems more than a coincidence that the statements and testimony of so many others align with Zapruder's suggestion that the last shot followed the head shot. **UNFAIR.**
- Bugliosi now introduces two woman bystanders into the mix of witnesses: **Mary Moorman** and **Jean Hill**. Bugliosi accurately notes that as they are preparing to take Kennedy's picture they are "*curiously unaware that shots have already been fired.*" As the first shot heard by them struck Kennedy in the head, and this shot rang out seconds after it was apparent to everyone else that Kennedy had been hit, this is a fair representation of their statements and testimony. (6H205-223). **FAIR. (X2)**

- He then returns to one of his first shot witnesses, **James Worrell**, still standing on the street beneath the sniper's nest. Worrell, he claims *"hasn't taken his eyes off the barrel of the rifle sticking out the window, and when he sees it fire again, he sees a little flame and smoke coming out of the barrel. There is a lot of commotion, people screaming and saying 'Duck'. Frightened, he turns and starts to run towards Houston, just feet away, intending to run to the back of the building."* Worrell, we should recall, testified to hearing four shots. This is the second time Bugliosi has called on him, and he still has not told his readers this fact. Even worse, this time he has directly misrepresented Worrell's testimony. After describing the third of the four shots he claimed to have heard, Worrell was asked by Arlen Specter *"What did you hear, if anything, after that?"*; Worrell replied *"Just a lot of commotion, everybody was screaming and saying 'duck.'"* (2H190-201) It is Worrell's testimony, therefore, that people yelled "duck" after the third shot fired. And yet Bugliosi has them yelling "duck" after the second shot fired. He's made one of the shots heard by Worrell simply disappear. Without discussion. Without explaining why. He even cites Worrell's testimony in support of this "improvement" on the historical record. **SUSPICIOUS.**
- The final witness offered to support Bugliosi's second shot is **Amos Euins**. Bugliosi has Euins scramble for safety after this shot, and hide behind a fountain. While this is consistent with Euins' testimony, Euins testified to hearing four shots. (2H201-210). As a result we can't be sure if Euins' scramble came after this shot, or the previous shot. **UNFAIR.**

While Bugliosi's presentation of this second shot is better than his presentation of the first shot, it is still incredibly misleading. While his first shot witnesses were presented in a manner that created an illusion that the first shot missed, his second shot witnesses were presented in a manner that additionally concealed that many of his witnesses felt the last two shots were almost simultaneous, an impossibility should Oswald have been the sole assassin.

Essentially, he presents 17 witnesses for his second shot. Williams, Hickey, and Kellerman stated that the last two shots were close together, with Hickey and Kellerman also believing that the first shot struck Kennedy. Glen Bennett and William Greer made confusing statements that can be taken either way, in support that a first shot missed, or support that the first shot hit, but were consistent with the others in that they claimed the last two shots were close together. Charles Brehm and Rufus Youngblood made statements indicating that they heard three shots, and the first one hit. President Johnson made a vague statement indicating that the first shot was fired after Bugliosi's first shot, and that "explosions" followed. Although they could only swear to hearing two shots, Clint Hill, Jackie Kennedy, and Abraham Zapruder all felt Kennedy was hit by the first shot, and hit in the head with the second. One could argue, then, that, should one accept that these last three witnesses failed to hear one of the rapid fire shots at the end of the shooting sequence, when they heard but one "explosion," these 11 witnesses heard the shots in a consistent manner, with a first shot hit just before or at the time of Bugliosi's second shot, and two rapid fire shots around the time of the head shot.

This leaves but six witnesses whose words might reasonably be interpreted as supporting Bugliosi's scenario, which, we should recall, he cites as a "fact". Two of these, Mary Moorman and Jean Hill, have not yet heard a shot. Two others, James Worrell and Amos Euins testified to hearing four shots, so they're not exactly supportive. Governor Connally was aware of three shots, with Bugliosi's second shot being the second, but testified that the first shot was fired considerably after Bugliosi's first shot. This leaves us Nellie Connally. She also felt Bugliosi's second shot was the second shot. But Nellie, sitting just a few feet away from Kennedy and Connally, felt certain Kennedy was hit by the first shot and Connally was not. It follows then that, once one reads the entire statements and testimony of the witnesses Bugliosi has presented, not one of them supports his version of history.

Bugliosi's Third Strike

- Bugliosi's account of the third shot, naturally, begins with a "BANG!" His first witness for this shot is **Howard Brennan**, whom Bugliosi has look to the sniper's nest and see the sniper pull the trigger. As Brennan heard but two shots, and as Bugliosi had Brennan look to the sniper's nest just after the first shot, and see the sniper fire again, Bugliosi is using Brennan's description of the one shot he saw fired...twice...to describe both the second and third shots. This is incredibly misleading. Making matters worse is that, on his endnotes, which are presented on a companion DVD with his book, Bugliosi discusses problems with Brennan's subsequent statements that he saw both the second and third shots fired and their impacts upon the limousine. Bugliosi notes that, from Brennan's position, he could not have seen the limousine at the time of these shots. So why, if Bugliosi knows Brennan only heard two shots, and knows he later acted as if he'd heard three, does Bugliosi use Brennan's testimony to describe a response to a shot and then the firing of two more shots? Sheer sloppiness? Or was he trying to disguise that Brennan, one of his star witnesses, failed to hear one of the shots he was presenting as a "fact"? **SUSPICIOUS.**
- On page 42 Bugliosi continues his narrative and uses **Abraham Zapruder** to describe the impact of this shot on Kennedy's skull. While this is a fair presentation of Zapruder's testimony, Bugliosi is not engaging in full disclosure. Not only does Bugliosi fail to mention the previously discussed suggestion in Zapruder's testimony that a third shot followed the head shot, he fails to relate that, as reported in a book repeatedly cited by Bugliosi, Richard Trask's *Pictures of the Pain*, the 11-22-63 notes of a Dallas Times Herald reporter captured Zapruder's immediate response to the shots, and revealed that Zapruder originally said that Kennedy "slumped over" after the first shot, and that two shots followed. (*Pictures of the Pain*, Trask, p.149) Bugliosi also leaves out that Zapruder was interviewed on WFAA television within two hours of the shots, and at that time he reported "*I heard a shot, and he slumped to the side, like this. Then I heard another shot or two, I couldn't say it was one or two, and I saw his head practically open up, all blood and everything, and I kept on shooting.*" (*Pictures of the Pain*, p.77). It seems more than coincidence that Bugliosi's avoidance of Zapruder's statements helps prop up his personal interpretation of the shots. Still, a final shot headshot is consistent with Zapruder's testimony. **FAIR.**
- Bugliosi uses his next witness, **Marilyn Sitzman**, Abraham Zapruder's secretary, to add to his description of Kennedy's head wound. Not surprisingly, Bugliosi fails to mention that, according to the interview Bugliosi cites as his source on Sitzman, she saw Kennedy react to the first shot, and saw his skull open up with a second shot, and did not hear his mythical first shot miss. (11-29-66 Sitzman interview with Josiah Thompson). Still, a final shot headshot is consistent with her statements. **FAIR.**
- At this point in Bugliosi's narrative, things really heat up. Mrs. Kennedy cries out after her husband is shot. This is a **FAIR** use of her testimony.
- Bugliosi then writes "*Just as Agent Clint Hill's hand reaches for the handhold on the trunk of the limousine he hears the sound of a fired bullet smacking into a hard object.*" He cites Hill's testimony as support for this statement. This is not accurate. When Hill, who ran from the back-up car to dive onto the back of the limo, testified "*Just about as I reached it, there was another sound, which was different than the first sound. I think I described it in my statement as though someone was shooting a revolver into a hard object--it seemed to have some type of an echo*" he was describing his race for the limo, not his reaching for the handhold, which happened a second or more later. This is admittedly nit-picking. More telling of Bugliosi's methods is his excision of Hill's comment about an echo, which could suggest the sounds of more than one shot at this time, from his narrative. **SUSPICIOUS.**
- He then has **Roy Kellerman**, sitting in the front seat of the limo, feel brain matter splatter in the

car, and hear Mrs. Kennedy yell out. This is **FAIR**.

- He now has **Paul Landis**, riding on the outside of the Secret Service back-up car, describe the impact of the bullet on Kennedy's skull. Here, in a rare moment of equanimity, Bugliosi admits that Landis, who felt the first shot came from behind, felt the fatal shot came from in front of the limousine. This is surprisingly **FAIR**.
- He then has **Governor Connally** and his wife hear Jackie Kennedy cry out about having her husband's brains in her hand. While this probably happened further down the road, it undoubtedly happened after the third shot, and is a **FAIR** use of their testimony.
- But with his next witness Bugliosi slips back into his old habits. Here, he describes **Roy Kellerman's** getting on the phone to call ahead to agent Lawson and report that Kennedy's been hit. He writes: *"But as he's starting to talk to Lawson and before Greer accelerates a third shot rings out."* Bugliosi's citation for this paragraph is Kellerman's testimony. But Kellerman's testimony is at odds with his account. Bugliosi has as good as made up words to stick in Kellerman's mouth. As we've discussed, Kellerman actually testified: *"I grabbed the speaker and said to the driver, 'Let's get out of here, we are hit!,' and grabbed the mike and I said, 'Lawson, this is Kellerman... We are hit; get us to the hospital immediately.' Now, in the seconds that I talked just now, a flurry of shells come into the car."* Not a third shot, as presented by Bugliosi...a *flurry* of shots. **SUSPICIOUS**.

When one considers Bugliosi's misrepresentation of Kellerman's words, and then recalls his avoidance of the statements of everyone who suggests there were two or more closely grouped shots around the time of the head shot, it should once again be more than clear that he is deliberately avoiding a discussion of what the eyewitnesses actually said, and is, instead, pushing his own theory of what happened. He is, in effect, knowingly cutting and pasting their words together to create an inaccurate picture of their testimony. The man who dedicated his book to the "sacred" historical record, is, disturbingly, engaging in a deliberate deception.

- Bugliosi then proceeds to tell the story of **John Ready**, a Secret Service agent on the outside of the car behind Kennedy, who, for one brief moment, considered running for the limousine during the shots. He states that *"Ready, who had jumped off the running board of the Secret Service follow-up car when the limousine had slowed and had started to run across the asphalt for the President's car, doesn't make it in time as the limousine speeds up, and Special Agent Emory Roberts orders Agent Ready back to the follow-up car."* Bugliosi cites Secret Service reports by Ready and Roberts as support for this story. Ready writes *"I left the follow-up car in the direction of the President's car but was re-called."* (18H749). Roberts, on the other hand, writes *"I told him not to jump as we had picked up speed and I was afraid he could not make it."* (18H731-738). Apparently Bugliosi knows which one we should believe. Ready's statement, by the way, offers very little insight as to how the shots were fired. **FAIR**.
- Bugliosi's use of **Emory Roberts**, the agent sitting in the right front seat of the car directly behind Kennedy, and thus the man with the best view in the world to report the sequence of the shots, to describe Ready's (probably non-existent) run, when he hasn't used Roberts previously to describe any of Kennedy's actions, however, is undoubtedly curious. Why hasn't he told us what Roberts saw? Well one look at Roberts' report from 11-29-63, the same report Bugliosi cites for Ready's run, suggests a reason why. Roberts relates: *"12:30 PM: First of three shots fired, at which time I saw the President lean toward Mrs. Kennedy. I do not know if it was the next shot or third shot that hit the President in the head, but I saw what appeared to be a small explosion on the right side of the President's head, saw blood, at which time the President fell further to his left..."* (18H733-738). Yep. Roberts, just yards behind Kennedy, not only believed that Kennedy was hit by the first of three shots, but implied that the last two shots came in so

fast he couldn't tell which one hit Kennedy in the head. If this doesn't make you wonder about Bugliosi's scenario, I don't know what will. **UNFAIR.**

- Bugliosi's next witness is **Sam Kinney**, the driver of the follow-up car. Bugliosi uses Kinney to describe his hitting the accelerator, but fails to tell his readers that Kinney, as Roberts sitting next to him, and so many others, thought the last two shots were so close together that it was difficult to say which one hit the President. On the night of the shooting, Kinney reported: *"The first shot was fired as we were going into an underpass...it appeared that he (the President) had been shot because he slumped to the left. Immediately, he sat up again. At this time, the second shot was fired and I observed hair flying from the right side of his head...I did hear three shots but do not recall which shots were those that hit the President."* (18H732) On 11-30-63, he filed a second report: *"As we completed the left turn and on a short distance, there was a shot...I saw the President lean toward the left and appeared to have grabbed his chest with his right hand. There was a second of pause and then two more shots were heard. Agent Clint Hill jumped from the follow-up car and dashed to the aid of the President and first Lady in the President's car. I saw one shot strike the President in the right side of the head."* (18H730-731). **UNFAIR.**

To refresh, just briefly, Bugliosi has now presented the statements of Secret Service agents Paul Landis, Glen Bennett, George Hickey, Clint Hill, Roy Kellerman, William Greer, John Ready, Emory Roberts, and Sam Kinney. He clearly believes they are credible. And yet, although Bennett, Hickey, Kellerman, Greer, Roberts, and Kinney all made statements indicating the last two shots were extremely close together, and Clint Hill said the last shot had a strange echo, suggesting it may in fact have been two shots extremely close together, and Paul Landis only heard one shot at the end, suggesting he may have interpreted the last shots as one shot, Bugliosi has failed to admit this to his readers. Instead, he is pretending their testimony is consistent with his belief that the first shot missed and that the final shot came after a near five second delay, and is hiding statements contrary to his belief from his readers. Isn't this exactly the kind of thing for which he excoriates others?

- Bugliosi continues his narration by having **Clint Hill** climb onto the back of the limousine, and Mrs Kennedy crawl out toward him. They both climb back onto the seat. This is **FAIR.**
- On page 43 Bugliosi backtracks a second and reports that **Mary Moorman**, standing on the grass just yards from the President, has taken a photo "an instant after the head shot." He reports that she "quickly falls to the ground" and tugs on the pants of her friend, **Jean Hill**, encouraging her to get down. He says Hill is too stunned to move. He cites a number of sources, including Jean Hill's testimony, in support of this activity. He fails to report that Hill testified that after she yelled "Hey" at Kennedy *"he started to bring his head up to look at me and just as he did the shots rang out. Mary took the picture and fell on the ground and of course there were more shots."* (6H205-223). She was thereby testifying that more than one shot rang out in this period, and that other shots rang out afterwards. He also hides that Mary Moorman signed a statement claiming: *"As I snapped the picture of President Kennedy, I heard a shot ring out. President Kennedy kind of slumped over. Then I heard another shot ring out and Mrs. Kennedy jumped up and said "My God, he has been shot!" When I heard these shots ring out, I fell to the ground to keep from being hit myself. I heard three or four shots in all."* (24H217). This also suggests there were two shots in this period, and aligns with the statements of the Secret Service agents. Bugliosi, of course, is pushing that there was but one shot at this time, and that the previous shot came almost 5 seconds earlier. **SUSPICIOUS. (2x)**
- His desperation to hide that there was a shot just after the head shot becomes almost embarrassingly obvious with the presentation of his next witness. Bugliosi reports that *"Charles Brehm instinctively throws himself on his young son, covering him with his body. Brehm a former army staff sergeant, knows about gunfire. Nineteen years before, at Brest in Normandy,*

not long after D-Day, a German bullet went through his chest and blew his elbow joint apart. Now, despite his desperate hopes, he is positive the President was also hit." Bugliosi cites both a 1963 FBI report on Brehm and Brehm's 1986 testimony in a mock trial for this dramatic passage. By simply reporting that Brehm threw himself onto his son, and not specifying that Brehm responded to the third shot head shot by covering his son, Bugliosi avoids admitting to his readers that Brehm was consistent in his statements from day one, and that Brehm stated unequivocally that Kennedy was struck in the head by the second shot, and not the third. In the 1986 mock trial, Brehm testified: *"when the third shot--which seemed to me to be a wasted shot--went off, which frightened me more than any of the others because then I thought it was somebody shooting up the place. I then fell on my son."* Bugliosi knows this not only because he cites Brehm's testimony in his book, but because he was the prosecuting attorney taking Brehm's testimony. Even worse, Brehm was his witness. Bugliosi's twisting of Brehm's words to support his claim as fact that the first shot missed (when Brehm testified it did not), the second shot hit both Kennedy and Connally (when Brehm said it hit Kennedy in the head), and the third shot hit Kennedy in the head (when Brehm said it seemed to have missed) is simply outrageous. **SUSPICIOUS.**

- He next has **Abraham Zapruder** yell out *"They've killed him! They've killed him!"* and follow the limousine out of the Plaza with his camera. This is fair but is a continuation of his earlier testimony.
- He now returns to **James Worrell**, still standing in front of the depository, looking up. He uses Worrell's Warren Commission testimony to assert that Worrell *"pivots and looks back over his shoulder before the window with the rifle in it is out of sight and sees the rifle fire a third time."* Bugliosi, not surprisingly, conceals from his readers what Worrell said next. Worrell testified: *"Just as I got to the corner I heard the fourth shot."* (2H190-201). Failing to tell his readers of this fourth shot is yet another egregious deception on Bugliosi's part. Nowhere in his book does Bugliosi mention that Worrell, whom he uses to convince his readers that 3 shots were fired from the sniper's nest, heard 4 shots, one of which must have been fired from a different location. Even stranger, the shot Bugliosi avoids mentioning in this passage is Worrell's fourth shot. Earlier, when discussing the second shot, he discussed events occurring after Worrell's third shot. From this it appears that, not only does Bugliosi make shots disappear at his convenience, he changes the shots that disappear at his convenience. **SUSPICIOUS.**
- Bugliosi then swings back to his star witness, **Howard Brennan**, sitting on a wall across Elm Street from the depository. He has Brennan dive off the wall as this shot rings out, and watch the gunman pull his rifle back in from the window. This is a **FAIR** use of Brennan's testimony.
- To help support Brennan's assertion that this last shot was fired from the sniper's nest, Bugliosi now introduces a few new witnesses. First, he has photographer **Robert Jackson**, riding on Elm Street in the motorcade, look up and see the rifle pulled in from the window. Bugliosi cites Jackson's testimony, but fails to tell his readers that Jackson testified *"the second two shots seemed much closer together than they were to the first shot."* (2H155-165). Such an assertion, as previously explained, is an indication that the first shot did not miss. It is also, however, a suggestion that either the second shot was fired sometime after frame 252, the mid-point between the earliest moment Kennedy could have been hit, frame 190, and the head shot at 313, or that the third shot was fired after frame 313. Bugliosi's inclusion of Jackson's statements about a third shot in a section devoted to the shot at frame 313, when he may have been describing a shot just after frame 313, is probably innocent, but nevertheless **UNFAIR.**
- At this time, Bugliosi dramatizes the thoughts and actions of the other photographers in Jackson's car. Bugliosi reports *"The press car was halfway up the block toward Elm when its occupants heard the first shot."* Is it really possible Bugliosi does not know that this correlates

to their location seconds after his proposed first shot miss?

- He then singles out **Malcolm Couch**, who claimed to have seen the rifle sticking out of the window after Jackson pointed it out to him. Here, Bugliosi finally stumbles into a witness whose story vaguely supports the scenario he's been pushing. While the 11-27-63 FBI report on Couch cited by Bugliosi says Couch thought the first two shots were 10 seconds apart, Couch testified that the first shot rang out when the car in which he was riding was "*uh, 15 or 20 feet from the turn—from off of Main onto Houston*" and that the shots were "*fairly close together, they were fairly even in sound.*" (6H153-162). This is vaguely supportive of Bugliosi's scenario. **FAIR.**
- Bugliosi then has the photographers observe the chaos that followed the third shot. While Bugliosi doesn't cite their statements and testimony, we'll be a little more thorough, and acknowledge that the other three photographers, **Tom Dillard**, **Jimmy Darnell** and **James Underwood**, were inconsistent in their statements and testimony, regarding the sound of the shots. While Dillard testified that three "*approximately equally spaced*" shots rang out when they were "*just a few feet around the corner,*" (6H162-167) thereby supporting Couch's testimony (and Bugliosi's theory), Darnell only mentioned two shots when he talked to the FBI (CD7 p29), and Underwood not only originally reported the last two shots came in "*quick succession*" (Pictures of the Pain, 420-421) but testified that the car was in the middle of the block when the first shot rang out (6H167-171).
- This brings us to Bugliosi's final witness to state there was a sniper in the sniper's nest, **James Crawford**. Standing on the eastern side of Houston Street, Crawford recalls seeing a fleeting glimpse of someone in the window just after the last shot. Bugliosi reports "*Crawford had thought the first loud sound he heard to be a backfire of a car...Then he heard the second sound and began to look around, thinking someone was firing firecrackers. As the report from the third shot sounded, he looked up and saw a very quick, indistinct movement in the southeasternmost window on the sixth floor of the Book Depository Building.*" In his usual fashion, Bugliosi cites the Warren Commission testimony of Crawford to support this, and in his usual fashion he forgets to tell his readers that Crawford testified to events in direct opposition to the version of events Bugliosi claims is a fact. Crawford testified: "*I believe there was a car leading the President's car, followed by the President's car, and followed, I suppose, by the Vice President's car, and in turn by the Secret Service in a yellow closed sedan. The doors of the sedan were open. It was after the Secret Service sedan had gone around the corner that I heard the first report and at that time I thought it was a backfire of a car*" and then continued "*The second shot followed some seconds, a little time elapsed after the first one, and followed very quickly by a third one.*" (6H171-174) By having the Secret Service sedan around the corner at the time of the first shot, Crawford was indicating the first shot was fired after frame 190 of the Zapruder film. Bugliosi, of course, has it at frame 160. The third shot that Crawford insisted followed "very quickly" after the second, furthermore, follows a tension-filled 5 seconds after the second in Bugliosi's scenario. For the reasons stated in our discussion of Jackson, Bugliosi's use of Crawford is probably innocent but nevertheless **UNFAIR.**
- Finally, to support that Crawford saw someone in the window, Bugliosi cites **Mary Mitchell**, standing next to Crawford, and her confirmation that Crawford pointed out the window just after the shots. Not surprisingly, Bugliosi neglects to tell his readers that she testified to hearing three shots, with "*the second and third being closer together than the first and second.*" (6H175-177). This, of course, fits the statements and testimony of the vast majority of witnesses offered by Bugliosi, but runs contrary to his conclusions. His use of Mitchell's statement to describe the reaction to a head shot at frame 313, when she quite possibly was responding to a shot after frame 313, is probably innocent but is nevertheless **UNFAIR.**

This brings us to the end of our exhaustive look at an exhaustive look. By a rough un-scientific count, which is, of course, open to re-interpretation, we have examined Bugliosi's use of the statements and testimony of dozens of witnesses to describe 55 responses or interpretations to these three shots. 16 of these descriptions seem to be fair ones, reflective of the statements and testimony of the witnesses. Another 17 of these are unfair ones--meaning that, if one were to read the full statements and testimony of these witnesses, one would probably conclude they were not describing a response to the shots proposed by Bugliosi. Another 22 of these are overtly suspicious in nature, suggestive that Bugliosi is deliberately trying to conceal contradictory evidence from his readers--the exact crime for which he vilifies others.

While one might wish to give Bugliosi the benefit of the doubt, and assume the widespread misrepresentation of the eyewitness evidence in his book came as a result of "dramatic license" and lousy fact-checking by a research assistant, one should consider that on June 14, 2007, during an on-air radio interview with Pittsburgh radio station, WPTT, Bugliosi asserted *"99.9 percent of the research in this case was done by myself. I couldn't rely on anyone else to do the research for me."* This suggests that Bugliosi is not only entirely responsible for the many misrepresentations in his book, but that he actively prevented anyone from double-checking his quotes and citations. In this interview, he claimed further that his book was a *"very special book"* and that it was, no surprise, *"a book for the ages."* As it was *"a book for the ages,"* he explained, normal marketing considerations, such as size, were not to be considered. In an immodest moment, he asserted *"When scholarship is in conflict with marketability, you go the scholarship route."*

One winces in the face of such hubris. This is the man who attacked Oliver Stone, who'd created an admitted work of fiction based on a real event, for not laying out the evidence that ran counter to his narrative. This is the man who attacked Mark Lane, who wrote the influential book *Rush to Judgment* as a defense brief for Oswald, for leaving the prosecution's case out of his book. This is the man who promised to *"omit or distort nothing."* And yet, in his over 2500 page book, he completely conceals the inconvenient truth that the eyewitnesses he uses to describe the shooting scenario he presents as a fact, only support his scenario when he cherry-picks their testimony. He never mentions that one of the three men crouched just a floor below the sniper's nest originally said there'd been but two shots. He never mentions that two of the three men who saw a gun fire from the sniper's nest thought there'd been a fourth shot. Despite his promises not to do so, he removes words from the statements of some witnesses, and adds words to the statements of others, which just so happen to change their meaning. Does such a man deserve the benefit of the doubt?

If one were to warm up one's psychiatrist couch, and throw Bugliosi onto the fire, as he does others (beyond his attacks on Oswald, he is found of saying that conspiracy theorists are "certifiably psychotic" and that writer David Lifton took a "journey into dementia") one might very well conclude that Bugliosi, in his zeal to simplify an otherwise complicated bit of American history, put on his blinders and constructed a dramatic narrative that safely supported his conclusions. On November 4, 2007, in an interview on Book TV, he offered up some insight which supports this conjecture. When asked why, at this point in history, he still doesn't use a computer, or even have a cell phone, he replied: *"I think I have an instinctive disinclination for anything mechanical or technological...I like simplicity. I want everything simple. When I speak to a jury, I put a bib on them and spoon-feed them. You've got to be simple. Life is simple for the simple-minded. Maybe it's because I'm simple-minded, I don't know. I like simplicity."* Thus, one might assume that Bugliosi, desperate to give Oswald more time to fire his purported shots, and with a predilection towards simplicity, simply took the cue from all too many before him, conjured up an imaginary first shot miss, made it appear he had witnesses describing this shot, and let the evidence be damned.

Well, one should ask, isn't this the "cultural crime" of which he accused Oliver Stone?

And what of those in the media who've (at least so far) supported Bugliosi's deception? Are they un-indicted co-conspirators? Accessories after the fact? Or are they, in fact, innocent bystanders to his historic train-wreck?

In historian Jon Wiener's 2005 report on his profession, *Historians in Trouble*, he notes that it is not unusual for books with tremendous errors to receive excellent reviews. He explains: "Of course no reviewer is expected to consult the primary sources cited in a book under review--the assumption is that the author has fulfilled his duty to accuracy." In the case of *Reclaiming History*, it's clear that no one from the *New York Times*, *Los Angeles Times*, and *Washington Post*--or any other media outlet for that matter--had the gumption or energy to consult the primary sources cited by Bugliosi. One should have thought they'd be curious to see if the man with all the answers had even marginally done his job. But one would be wrong. It is undoubtedly ironic then that a book designed to scold those who twist the historical record to meet their own ends, twisted the historical record to meet its own ends, and went undiscovered by the self-appointed watchdogs of the media, who were more than eager to kick sand in the face of those who twist the historical record to meet their own ends. It is ironic but not at all amusing.

Part 4: Renouncing Hypocrisy

In April 2008, Playtone, the Tom Hanks-owned company currently at work on a multi-million dollar, multi-part production of Bugliosi's *Reclaiming History*, a bio-pic on the death of an American president, premiered a multi-part production of John Adams, a bio-pic on the life of an American president. This too, was ironic, but not at all amusing. Okay. It was slightly amusing.

At one point of this production, in a scene presumably contrived for television, Adams, who bore a striking, almost eerie, resemblance to the actor Paul Giamatti, criticized the painter John Trumbull for his overly clean and patriotic depiction of the signing of the Declaration of Independence. His words, slightly edited, came straight from David McCulloch's book on Adams, which, one can only hope, did come straight from Adams' letters and writings.

In McCulloch's book, Adams complained: "it is a common observation in Europe that nothing is so false as modern history; I should say nothing is so false as modern history as ancient history, and I would add that nothing is so false as ancient or modern history in Europe, except modern American history."

He also unleashed this warning: "Do not let our posterity be deluded with fictions under the guise of poetical or graphical license."

One can only hope someone at Playtone recognized the irony.

Still, irony is often lost on those determined to reclaim a history that never really was.

One can only hope then that at least one member of academia, the press, or the Washington establishment, would note the irony. Yet nothing has been written in the national media (of which I am aware) criticizing Playtone's production of Bugliosi's book. One can only imagine the outrage among historians, the press, and the establishment, if, say, Oliver Stone purchased the rights to a book about, let's say, Pearl Harbor, which upheld, through events related in sworn testimony but taken out of sequence, the "fact" that Roosevelt knew all about the upcoming attack and did nothing to prevent it. One can only imagine the outrage if, say, Oliver Stone, bought the rights to a book about, let's say, the Iran/Contra scandal, which upheld, through sworn testimony cherry-picked from testimony suggesting a different scenario, the "fact" that Ronald Reagan had personally profited from the sale of arms to terrorists. Should Stone do such a thing he would be called a "murderer" of our "sacred" historical record, or maybe just "Oliver Stone," as his name has become synonymous with "murderer of our sacred historical record" to all too many.

And yet, in *Reclaiming History*, Bugliosi has asserted as fact, through illustration and argument, a sequence of events which is grossly at odds with the historical record he purports to be defending. This sequence of events is no minor subplot in his book of books, mind you, but is the central event of his book. It is the cornerstone upon which he builds his argument that Lee Harvey Oswald acted alone in killing President Kennedy. His selective use and editing of the evidence, moreover, suggests he knows full well that his version of events is at odds with the historical record, and is seeking to hide this from his readers. Where's the outrage?

When a creationist writes a book, purporting to be scientific, that so obviously and deliberately misrepresents evidence, the book is either criticized or ignored. So why, when his book contains these same flaws, has Bugliosi's book drew raves?, Is it "okay" to mislead if it's done for the greater good? If so, then who decides the "good"? If so, then how is Vincent Bugliosi any better than, gulp, Oliver Stone?

On December 17, 1991, in the *Washington Post*, former Warren Commissioner and ex-President Gerald Ford and former Warren Commission counsel David Belin wrote "*The basic format underlying the dissemination of lies is to cover up the overwhelming weight of the evidence and instead paste together scraps of testimony to form a case...*" Although, as we've seen, they were describing Bugliosi's use of narrative in *Reclaiming History*, they thought they were describing the methods of Oliver Stone.

Oliver Stone included their comments in his book about his movie. All of the early criticisms of Stone cited in this discussion come from Stone's book about his movie. While Oliver Stone was purported to have been intellectually myopic, and a propagandist, he nevertheless admitted his work was a work of fiction, based largely on the memoirs of a controversial figure, and featuring an alternative take on the same pool of information used by the Warren Commission to come to its conclusions. His film was well-received by the public and successful in its stated goal of provoking the U.S. Government into releasing hundreds of thousands of assassination-related documents to the research community.

Vincent Bugliosi, on the other hand, is a polemicist of different stripe. While he once denounced Stone for using film to present his distortions, as "*anything shown in a movie tends to be taken as a truth*," he has now entered into a deal to sell his own witting distortions of the evidence to the American public, using, well...not only film, but the credibility and star power of Bill Paxton and Tom Hanks. Meanwhile, while the film is in production, he has refused to debate serious researchers of different perspectives. Neither he nor Hanks' production company have sought to balance the perspective of his book and create something closer to truth, by hiring outside experts to help catch and correct Bugliosi's numerous mistakes, and assure that his mistakes are not repeated in the film. Certainly, at this moment, the thought of Bugliosi publishing a book comprising critiques of his work so that future generations can make their own decisions about his intelligence and integrity, a la Stone, is beyond anyone's imagination.

Bugliosi, apparently, has alienated even those who agree with him. His stratospheric arrogance is such that even his ally of sorts, Max Holland, currently at work on a Warren Commission defense of his own, felt it worthy of comment. In his May 20, 2007 review of *Reclaiming History*, Holland wrote: "*there is an occupational hazard that comes with being an advocate, especially a prosecutor, rather than a historian. Mr. Bugliosi assumes a pose of omniscience that is not always warranted. He is absolutely certain even when he is not necessarily right.*" This arrogance is never more apparent than when Bugliosi is in front of a camera. In a video-taped interview presented online to promote his book, Bugliosi boasted "*It's my very firm belief--I'm very, very confident--that no reasonable, rational person -- and let's underline those words 'reasonable' and 'rational' -- no reasonable, rational person can possibly read this book without being satisfied beyond all reasonable doubt that Oswald hit Kennedy and acted alone.*" Bugliosi's publisher, of course, shares this sentiment and claims his book answers all the questions.

Let's recall here the words of the New York Times' Tom Wicker. Wicker's chief complaint about Oliver Stone, he claimed, was not that Stone believed Kennedy had been killed by a conspiracy and Wicker did not, but that Stone cast negative aspersions on *"anyone who doesn't share his one true faith."* Wicker further complained that Stone *"uses the powerful instrument of a motion picture, and relies on stars of the entertainment world to propagate the one true faith."*

I hereby submit that Vincent Bugliosi is the real Oliver Stone.

Post Script

In 2008, it became apparent that Vincent Bugliosi's misrepresentation of the Kennedy assassination witness statements was no one-time mistake, and that such misrepresentations were for him quite possibly business as usual. A website was created for his book, with excerpts from many of the positive reviews cited above. Included in these quotes, however, was a quote from an unexpected source, noted conspiracy theorist Dr. David Mantik. The quote read: *"It is likely that [Reclaiming History] will stand forever as the magnum opus of this case. . . . It is a masterpiece."* This was a bold and deliberate misrepresentation of Mantik's actual comments, however, which read, in part:

"It is likely that this book will stand as the magnum opus of this case--though not without serious flaws...I would liken the book to a house held aloft by a multitude of stilts...The problem, as we shall amply soon see, is that he (Bugliosi) wears permanent blinders, particularly when it comes to experts, and especially so for those from science...As I see it, the fundamental difference between scientists and lawyers lies in epistemology—i.e., how does one define, or even find, truth? For lawyers, steeped in the adversarial system, the answer is clear-cut: use expert witnesses, and then let a jury vote. For a scientist, the very notion of a debate, and then a vote on truth, would be absurd, simply laughed out of court in a nanosecond. Instead, the scientist would set up a controlled experiment, perform multiple measurements, and then publish his results in a peer reviewed journal. But for his work to be accepted as part of the scientific corpus, it would likely be repeated several times over by independent groups...B's book represents a massive, even prodigious, outpouring of work. One must be either mad or a genius to wallow for 20 years in such an interminable project..In its own way, it is a masterpiece--a truly great prosecutorial brief...As would be expected, he sometimes misuses medical terms (and even misunderstands what I know), but overall he communicates these issues well, though we often disagree profoundly on interpretation. Whenever possible, though, he prefers simply to quote the experts who side with him, especially those from the WC and House Select Committee on Assassinations (HSCA). Of course, that's precisely what we should expect: lawyers are paid for presenting the experts, not for presenting the evidence. B rarely shows much originality or personal ability to analyze the medical or scientific data. In essence, he operates with a crutch virtually all of the time—without these experts at his side he is a near cripple. As for me, coming from a scientific background, and being thoroughly familiar with virtually all of this JFK (medical and scientific) evidence, I found B's myopic and closed-minded view of this critical data acutely disappointing. How can one dialogue with a lawyer who hides behind his chosen experts? Somehow, from such a brilliant mind, I had hoped for more. It was, of course, unreasonable of me. The gap between the different cultures is simply too large."

Now this was clearly a negative review, calling into question not only the accuracy of the information presented in the book, but Bugliosi's ability to interpret the information. Even so, in May 2008 the abbreviated quote in which Mantik appeared to rave about a "masterpiece" was put on the front pages of Four Days in November, the scarcely-noticed paperback abbreviation of Bugliosi's monstrous book.

On 6-12-2008, Bugliosi's number one fan David Von Pein sent Bugliosi's secretary an e-mail complaining about this and other developments. He posted this online. It concluded:

"I really wanted Vince B. to know about these things (which I truly don't think he's aware of at all) -- especially the Mantik review blurbs, which, as mentioned, are just flat-out embarrassing after reading Mantik's WHOLE review.

It makes it look as if the publisher (Norton) is so desperate for ANY kind of praise from the pro-conspiracy crowd that they are willing to bend the context of Mantik's words to suit their own pro-RH purposes. And that's not a good thing at all, in my view."

Von Pein received no response to his complaint, and the bastardized "quote" of Mantik praising Reclaiming History is still featured on its website.

This was actually not surprising. You see, what Von Pein failed to realize was that the deliberate misuse of Mantik's words was quite possibly not thought up by Bugliosi's publisher, but by Bugliosi himself. In late 2007, when the first negative reviews of Reclaiming History started trickling to the surface, Bugliosi chose to respond by attacking his critics, and to try to show them the error of their ways. To do this, he threatened them with lawsuits and quoted liberally from what he contended were positive reviews of his book. One such quote came from David Mantik's largely negative review of his book. It went like this: "It is likely that (Reclaiming History) will stand forever as the magnum opus of this case...It is a masterpiece."

While it's certainly possible that someone from Bugliosi's publisher furnished him this quote, and that he innocently repeated it, it seems highly unlikely that Bugliosi would fail to read a review by a prominent conspiracy theorist, particularly one in which the writer called his book "a masterpiece." As a result we can feel quite certain that Bugliosi knows full well his use of the quote is deceptive. And that he simply doesn't care.

I mean, let's be honest. This is a man who arranged or at the very least allowed the cover of his book *Four Days in November* to boast, in quotes above the title, "a book for the ages," when that quote, even if accurate, was never used to describe *Four Days in November*, but *Reclaiming History*, the much larger and more comprehensive book from which it was excised. Telling the truth was never in the cards.

Appendix One: The First Shot Miss Dilemma

The First Shot Miss Dilemma

Frame 188
(Kennedy shows no signs of being hit).

Frame 225
(Kennedy is reacting to a shot).

Frame 313
(Kennedy is fatally injured).

When Bugliosi proposes that the first shot missed circa frame 160 of the Zapruder film, he is not only proposing that the large number of witnesses close to the President who believed he was hit by the first shot were wrong, but that the vast majority of witnesses to comment on the timing of the shots (who felt the last two shots were much closer together than the first was to the second) were wrong. This doesn't leave a lot of witnesses from which one can honestly draw support. Bugliosi doesn't even try. The support he offers for his proposed "fact" is undoubtedly deceptive.

Appendix Two: Reclaiming History from Reclaiming History

Reclaiming History from Reclaiming History

Warren Commission Exhibits 347 (at left) and 354 (at right) were photos of Dealey Plaza with notations made by witnesses. Insert shows Kellerman's X and Greer's A on 347. Other notations on 347 and Z-frame locations on 354 are added-on.

When one inspects Warren Commission exhibits 347 and 354, and matches them up to the testimony explaining what the notations on them are designed to represent, it becomes painfully clear that the first shot miss circa frame 160 proposed by Bugliosi and his fellow single-assassin theorists, is nonsense, as wacky as most anything proposed by the conspiracy theorists they so actively disrespect.

Notations on CE 347:

- Secret Service agent Roy Kellerman, who rode in the front seat of the Presidential limo, marked the motorcade route, marked an X to reflect his appraisal of the limo's location at the moment of the first shot, and marked a Y to reflect his appraisal of the limo's location at the time of the second and third shots. (The version of CE 347 reprinted in the Warren Commission's volumes was nearly unreadable. After playing with the contrast of this image, however, I was able to discern Kellerman's X on the road near the limo's location around frame 190 of the Zapruder film. I was unable to ascertain the precise location of his Y.)
- Secret Service agent William Greer, the driver of Kennedy's limo, marked his appraisal of the limo's location at the time of the first shot with an A, the second shot with a B, and a third shot with a C. (I was able to discern Greer's A at a location around frame 220 of the Zapruder film, but was unable to ascertain the locations of his B and his C.)
- Buell Wesley Frazier, who was standing on the front steps of the depository, directly beneath the sniper's nest, marked by putting an F inside an oval the plaza location from where he thought the shots had been fired. (He placed this F in an oval in the railroad yards, far west of the building.)

Notations on CE 354:

- Secret Service agent Clint Hill, who ran from the back-up car and climbed onto the trunk during

the shooting, marked his appraisal of the location for the first shot with an X, and his appraisal for the second shot he heard--which was the fatal head shot--with a Y. (His X is at around the limo's location at frame 175 of the Zapruder film. His Y is around the location of the limo at frame 220. As the head shot clearly occurred when the limo was much further down the street, it seems likely he placed the first shot too close to the corner as well.)

- Secret Service agent Rufus Youngblood, riding in the Vice-Presidential limo two cars back from the President, marked the location of this limo at the time of the first shot with an A. (Youngblood's A is on Elm Street around the President's location at frame 180 of the Zapruder film. As the VP limo was 40-50 feet behind the President's limousine, this places the first shot somewhere between frames 220-230 of the film.)
- Motorcade witness Arnold Rowland marked a V to show where he was standing as the motorcade passed, an A to show where he'd been standing when he observed someone other than Oswald in the sniper's nest minutes before the shooting, a B to show where he went after that, and a D to show where he was pulled after the shots. (Rowland's V, apparently, was transposed by someone into an A at the corner of Houston and Elm.)
- Motorcade witness Virgie Baker marked a 1 to show where she was standing during the shooting and a 2 to mark the location where she thought she saw something hit the street behind the limousine. (Her 2 is approximately 100 feet away from her location, and at least 70 feet past where a bullet impacting behind the limo would have impacted should she have witnessed this impact circa frame 160 of the Zapruder film.)
- Warren Commission Counsel Wesley Liebeler marked a 3 to show where photographer James Altgens believed he was standing at the moment of the first shot. (He placed Altgens much further up the street than Altgens' actual location, as revealed by the Zapruder film, where Altgens remains unseen till after the head shot.)
- Liebeler next marked a 4 to show where Dallas Policeman Joe Marshall Smith believed he'd been standing during the shooting, and a 5 to show from where Smith believed the shots had been fired. (He placed this 5 near the end of Elm Street in back of the arcade.)
- Liebeler then marked a 6 to show where James Tague believed he'd been standing when he was wounded by a piece of flying cement, and a 7 to show where Tague later told his story to a Dallas Police officer.
- And finally, Liebeler marked an 8 to show where Policeman Welcome Barnett believed he'd been standing during the shooting. Barnett later corrected this position, and his corrected position is marked by a 9.

Appendix Three: Johnson's Lincoln

Johnson's Lincoln

At left: frame 160 of the Zapruder film, the moment Bugliosi proposes that the first shot rang out. The light-blue Lincoln in which Johnson was riding was just making the turn onto Elm. Everyone in this car stated that the car had completed its turn and was driving down Elm when the first shot rang out

At right: a crop of the James Altgens photo taken at frame 255 of the Zapruder film, isolating the Vice-President's car. Lady Bird Johnson and Senator Ralph Yarborough are still sitting upright in the back seat. As President Johnson believed that Secret Service agent Rufus Youngblood, riding in the front seat of the car, pushed him down and ushered the others to get down immediately after the first shot, it seems unlikely the first shot rang out at as far back as frame 160, more than 5 seconds before this photo.

The shot sequence Bugliosi presents as a fact is at odds with the statements of everyone in Johnson's Lincoln.

Appendix Four: Connally First Shot Analysis

Connally First Shot Analysis

Insert at top: a crop of Warren Commission Exhibit CE 699: an aerial view of Dealey Plaza. Blue arrow added to show where Connally heard the first shot..

Above: Warren Commission Exhibit 882: a map of Dealey Plaza. Added lines mark Kennedy's position at Z-160, Z-190, Z-224, and Z-313. Blue circle reflects Connally's mark in CE 699.

Chapter 10: Examining the Examinations

The beginning of a detailed examination of the medical evidence, focusing on the manipulation of the back wound's location between 1963 and 1969

The Wandering Wounds

Autopsy Face Sheet,
November 22, 1963,
published as Warren
Commission Exhibit 397,
based on Dr. Boswell's direct
observation of the body.

Warren Commission
Exhibit 386, March 16,
1964, based on verbal
descriptions from
the autopsy doctors.

HSCA Forensic Pathology Panel
Report Figure 24, March, 1979,
based on the panel's interpretation
of the autopsy photos.

For reasons beyond my grasp, the first image in each chapter sometimes fails to appear. If there's nothing up above, don't despair; you can still see the image [here](#)

The Wandering Wounds

Let us now discuss the medical evidence in the excruciating detail it requires.

While defenders of the FBI and Warren Commission, such as historian Max Holland, like to pretend there is nothing to discuss here, as all the questions have long been answered (In November 1995's *American Heritage Magazine*, Holland actually claimed that the *"passing controversy over the President's autopsy..had been fairly easily resolved"*), I suspect the reader will come to agree that the questions publicly asked and answered have been just the tip of the iceberg.

Let us begin, then, by examining the movement of the President's back wound.

On the evening of the assassination, an autopsy was performed on the President at Bethesda Naval Hospital. During the autopsy, Dr. J. Thornton Boswell marked the location of the President's wounds on a pre-existing outline of a body, on a piece of paper called a face sheet. This face sheet was eventually published in one of the 26 supporting volumes of the Warren Report.

On March 16, 1964, almost four months later, however, the autopsy doctors--Dr. Humes, Dr. Boswell and Dr. Finck--were called to testify before the Warren Commission. In preparation for their testimony, and at the urging of Warren Commission counsel Arlen Specter, Dr. Humes and Dr. Boswell met with medical illustrator Skip Rydberg and created three drawings depicting the President's wounds. As the doctors were not allowed access to the autopsy photos, or even the face sheet, during the creation of

these drawings, they were forced to rely purely on their memories.

They were not pleased with having to do so. Dr. Humes, in fact, testified that the autopsy photos would demonstrate the wounds more clearly than the drawings, and admitted that the drawings were “*schematic*” and imprecise. His use of the word “*schematic*” was no mistake, either. A schematic depicts an “*arrangement of ideas into a systematic order*,” according to an old Webster’s, and is thus an admitted distortion. One of the three drawings demonstrates the presumed trajectory of the bullet creating the back wound and depicts the location of the wounds as viewed from the side. Yet another of the drawings depicts the trajectory of the fatal bullet and presumed position of the President’s head at the moment of the fatal shot’s impact. And the third drawing shows how these wounds might appear from behind.

And that’s just the beginning of the problems related to these drawings. As shown above, the location of the back wound on the face sheet was several inches lower than the location of the wound on Rydberg’s drawings. This was problematic. Since Oswald was believed to have fired at the President from a sniper’s nest more than 60 feet above and behind the President, it follows that if he were the shooter the President’s back wound would be at a higher point on his body than the purported exit on his throat. And yet the back wound on the face sheet was below the throat wound...

It should come as no surprise then that the upwards migration of the back wound for the Warren Commission’s exhibits was taken by many as an indication Warren Commission Counsel Arlen Specter had moved the wound to support his “single-bullet theory,” which held that a bullet passed through Kennedy from the sniper’s nest location, and proceeded to hit Governor John Connally seated in front of Kennedy.

But it’s a bit more complicated than that.

To get a clear understanding of why and how the wounds moved, we must go back to November 22nd, 1963, when the doctors performing the autopsy had a serious problem. They found a small entrance hole on the back of the President’s head, and a large exit hole by his temple, and concluded these holes were caused by the same bullet, but couldn’t figure out what became of the bullet causing a wound in the President’s back. When they learned that a bullet was found on a stretcher in Dallas, they concluded that this bullet must have fallen from the back wound during heart massage. Apparently, neither the doctors nor the FBI agents at the autopsy were aware that Dr. Perry, one of the doctors in Dallas, had already discussed a wound on the President’s throat at a press conference covered by the media.

The next day, however, after talking to Dr. Perry, and realizing he had performed a tracheotomy incision through this throat wound, and had thereby obscured its appearance, Dr. Humes concluded that the bullet penetrating the President’s back had proceeded to exit his throat. What’s important to understand, however, is that Dr. Humes made this deduction without re-inspecting the President’s body, and without even consulting the autopsy photos, which had been seized by the Secret Service. Only adding to his confusion was the unfortunate fact that Dr. Humes was a laboratory pathologist, accustomed to inspecting specimens to confirm a pre-existing diagnoses, and lacked experience as a forensic pathologist, whose job, according to Dr. Cyril Wecht, is “*to establish independently the exact cause and manner of death*.”

This lack of proper training, then, helps explain Dr. Humes’ inclusion of newspaper accounts in his subsequent report. His inclusion of these items as support three shots were fired from above and behind, furthermore, helps us understand that Dr. Humes was trying to match the wounds to the shots, as opposed to the other way around.

Knowledge of these accounts, moreover, would serve to discourage Humes from concluding there were more than three shots fired, or that any of the shots could have come from anyplace but above and

behind. Dr. Humes simply concluded that there was an entrance on the back and an exit towards the front of the President's skull, and an entrance high on the President's back and an exit near that level on his throat. Thus, the President must have been hit twice. Since Governor Connally, sitting in front of the President, had also been hit, this would account for the three shots heard by the witnesses. It was apparently just that simple for Humes. He really thought he'd figured it out. Keep in mind that he had marginal experience with wound ballistics and bullet trajectories, and had acknowledged problems with angles and numbers. Humes just used his common sense and came to a common sense solution. Four holes and no bullets in the body meant two shots struck the President. Period.

Unfortunately, a deduction such as this can have side effects. The memory research of Dr. Elizabeth Loftus reveals that when people are asked to imagine a plausible event their imagined events can creep into their memories. It is not illogical, therefore, to presume that Dr. Humes' and Dr. Boswell's attempt to determine--when Kennedy's body was no longer in front of them--if the wound on his back could connect to a wound in the location of the tracheotomy incision led to their recalling the back wound at a point higher than its actual location, in line with a shot from where they'd been told the rifle had been fired. Thus, the memories of the doctors may have been tainted even before meeting with Warren Commission counsel, and future U.S. Senator, Arlen Specter.

But the Warren Commission undoubtedly encouraged the tainting. On January 27th 1964, in executive session, Chief Counsel J. Lee Rankin told the Warren Commission that the face sheet (which he called a picture) placed the back wound below the throat wound and that he would be seeking the doctors' "help" along these lines. While it seems clear the Rydberg drawings' depiction of the back wound above the throat wound was the very "help" Rankin was looking for, it does not mean the drawings were deliberate deceptions, however, as the doctors may have honestly come to believe the back wound was above the throat wound.

Note that I wrote "may." As noted by Dr. Cyril Wecht in *Six Seconds in Dallas* (1967), when one reflects that the autopsists, by their own admission, at one point suspected that the bullet creating Kennedy's non-fatal wound had been forced back out the entrance during cardiac massage, it's quite difficult to imagine how they could possibly have come to believe this entrance was on the back of Kennedy's neck (where it is depicted in the Rydberg drawings), as opposed to being on his back (where it is depicted on the face sheet). It seems likely, then, that the drawings were a deliberate deception.

Even so, events subsequent to the introduction of the Rydberg drawings suggest that the worst deceptions came later. Dr. Humes testified on March 16 that the drawings were schematic and that the autopsy photos would more accurately depict the President's wounds. The transcript to an April 30th executive session of the Warren Commission, furthermore, reflects that Counsel Rankin himself requested that Dr. Humes be allowed to examine the autopsy photos and compare them to the Rydberg drawings. This request, for that matter, was triggered by a memo of that same day from of all men Arlen Specter, which anticipated:

"Commission Exhibits Nos. 385, 386, and 388 were made from the recollections of the autopsy surgeons as told to the artist. Some day someone may compare the films with the artist's drawings and find a significant error which might substantially affect the essential testimony and the Commission's conclusions. In any event, the Commission should not rely on hazy recollections, especially in view of the statement in the autopsy report (Commission Exhibit #387) that:

"The complexity of those fractures and the fragments thus produced tax satisfactory verbal description and are better appreciated in the photographs and roentgenograms which are prepared."

While Rankin's request was approved, and while a May 12th memo from Specter indicates that an inspection by Humes was forthcoming, no such inspection took place, due to the admitted interference

of Chief Justice Earl Warren, who decided to inspect them himself.

Blind Justice

Warren's viewing the photos all by himself was one of the most questionable acts in an investigation defined by its questionable acts. In late May, 1964, around the time he was set to inspect the autopsy photos, Chief Justice Warren suddenly announced that the commission would not be publishing the testimony and evidence gathered at its hearings, including the drawings created by the autopsy doctors. This suggests the possibility a private inspection of the photos had led Warren to realize that the doctors' drawings were deceptive, and that he was trying to find a way to keep this hidden from the public. (Warren's decision not to publish the drawings was soon overturned by his fellow commissioners, none of whom had seen the autopsy photos.)

Warren's stated excuse for not allowing others to look at the photos, moreover--that he himself had looked at the photos and found them horrible and unnecessary to the work of the Commission--is truly hard to believe.

Still, when one considers that Warren was later to admit he found the case against Oswald a relatively simple matter, and was reported in a November 1966 Newsweek article to have boasted *"If I were still a district attorney and the Oswald case came into my jurisdiction, given the same evidence, I could have gotten a conviction in two days, and never heard about the case again,"* it seems possible he considered his task of being fair to Oswald a pointless one, and that this justified his exclusion of what he believed to be horrifying medical evidence from the record.

One might think the Chief Justice of the United States would have better sense than to deny such an important case its "best evidence" for personal or political purposes, but this was but one of numerous decisions made by Warren that reflect he saw the commission's work as political.

An August, 17, 1992 article in U.S. News & World Report, written with the cooperation of the surviving Warren Commission counsel, supports that Warren saw the commission's work in this light. Here, it was disclosed that he'd become severely agitated when he was informed that the final report of his commission would not be ready by July 1, 1964, as originally projected and as promised President Johnson. Here, it was also reported that after this failure the White House gave Warren a new deadline of August 24, the day of the Democratic convention. That this second deadline was given to Warren by McGeorge Bundy, Johnson's National Security Adviser, is especially intriguing.

Warren's denial that politics played any role in the commission's actions is also quite intriguing... Was he lying? Or was he simply in denial? When asked, in a November 3, 1971 oral history interview performed for the Johnson Library, if conducting the investigation in a campaign year *"posed any problem"* for the Commission, Warren at first grew confused, and tried to claim the investigation was in '63. He then realized his mistake, and answered *"No, no, really it was no factor. It was no factor at all, no factor at all."* Okay. When asked, in a March 26, 1974 interview by Warren Commission historian Alfred Goldberg if the Commission's report would have been better if the Commission had had more time, however, Warren said something quite different. He said *"We had all the time we wanted. If we had gone any further we would have gone into the political mess of the Presidential campaign."* While he then added *"There were no avenues left to explore,"* this was clearly cover for what he'd just admitted. The Commission's report was rushed out, after all, before the fingerprints in the sniper's nest could all be identified, and before the FBI's investigation of a mysterious sighting of Oswald in the company of anti-Castro Cubans could be completed.

That the Warren Commission was infected by political considerations from its beginning, however, can not reasonably be disputed. Heck, even its chief defender, former counsel David Belin, in his book on

the assassination, You Be The Jury, acknowledged that the ramifications of Warren's decision not to replace a no-show senior counsel named Francis Adams for fear how it might look, and to instead dump Adams' responsibilities in the lap of the relatively inexperienced Arlen Specter, were "*indeed chilling*".

Warren's comments in his final years, however, should make one suspect there was something more to his decision to withhold the autopsy photos from the doctors than his simple concern for the Kennedy family's privacy, and desire to move the Commission forward. In March 1974, a few months before his death, for example, Warren told Commission historian Alfred Goldberg, who'd asked "*On reflection, do you think it would have been better to have permitted the Commission staff access to the x-rays of the President?*" that "*On reflection, I do not believe that access to the x-rays should have been given. The public was given the best evidence available, the personal testimony of the doctors who performed the autopsy. In a trial, the court would not have permitted the x-rays to be introduced because it would have operated against the defendant. This decision was largely mine but the Commission approved.*"

Warren's answer to Goldberg is both hard to believe and historically inaccurate. Since when has a drawing of a victim's wounds based upon a doctor's verbal recollections been considered "better evidence" than a photo taken at the actual autopsy? Particularly when the doctor's own testimony says the x-rays and photos taken at the autopsy would better demonstrate these wounds? And since when have x-rays been considered too prejudicial to be allowed into evidence? X-rays have been admitted into evidence since 1896. And if Warren was so hesitant to use the x-rays, then how come not one but *nine* x-rays of Governor Connally were entered into evidence and printed in Volume 17 of his Commission's Report?

And that's just the start of it... In 1977, in his posthumously published memoirs, Warren once again discussed the Kennedy assassination medical evidence, and finally confirmed the rumors dating back to at least November 1966 that he'd viewed the autopsy materials. (The 11-18-66 issue of Life Magazine featured an article on Robert Kennedy by Hugh Sidey in which it was incorrectly claimed Robert Kennedy had withheld the autopsy photos and x-rays from the Warren Commission, but correctly claimed Warren had seen these materials. One wonders then, who told these things to Sidey.) In any event, in his memoirs Warren repeated his nonsensical claim that his personally viewing these materials and withholding them from others was not at all unorthodox and was, in fact, in Oswald's best interest. He insisted: "*the procedure adopted by the Commission was the one commonly used in criminal court to establish cause of death. In such circumstances, the court would not permit the prosecution to exhibit such a revolting picture because of the prejudice it would instill in the minds of the jury.*"

Even if Warren truly believed the photos and x-rays to have been too private to be placed into a public record, why should the autopsy doctors themselves, who'd already seen Kennedy's body, and had, in fact, scooped out his brains, have been denied the opportunity to check their findings against the photos and x-rays they themselves had taken? The offered explanation that Warren wanted everything used by the Commission to be made public just doesn't fly and is refuted by the thousands of pages on Oswald he unquestioningly withheld from this very same public. In sum, then, Warren's withholding the autopsy materials from the doctors makes no sense unless one accepts that Warren was either an incompetent old fool more concerned with protecting people's memories of Kennedy than in solving his murder, *or* was a competent politician tasked with white-washing what he knew to be a very complicated killing.

In 2005, I decided to research Warren's comment that the x-rays could not have been used in a court of law because they would have "*operated against the defendant*" and instill "*prejudice*" in "*the minds of the jury.*" I concluded he was citing Rule 403 of the Federal Rules of Evidence. It holds: "*Although relevant, evidence may be excluded if its probative value is substantially outweighed by the danger of unfair prejudice, confusion of the issues, or misleading of the jury, or by considerations of undue delay,*

waste of time, or needless presentation of cumulative evidence.” Introduction to Criminal Evidence by Jon R. Waltz discusses this a bit further. It says that photographs are admissible provided that:

1. The relevance of whatever the photographic evidence depicts must be demonstrated;
2. The evidence must be shown to constitute a true and accurate representation of what it depicts; and
3. The probative worth of the photographic evidence must not be outweighed by a potential for unfair prejudice stemming from its gruesome or inflammatory nature.

On the other hand, Waltz notes that “*Ever since Franklin (Franklin V. State, GA, 1882) it has been the rule that photographs and films are not ruled inadmissible simply because they depict in a graphic way the details of a shocking or revolting crime. They will be deemed inadmissible only if they are irrelevant to the issues in the case or where their probative worth is outweighed by their potential for unfair prejudice.*” Furthermore, Rule 401 of the Federal Rules of Evidence holds that “*‘Relevant Evidence’ means evidence having any tendency to make the existence of any fact that is of consequence to the determination of the action more probable or less probable than it would be without the evidence,*” and Rule 402 holds that “*All relevant evidence is admissible, except as otherwise provided by the Constitution of the United States...*”

These rules then lead me to conclude that the autopsy photos would have been inadmissible for the prosecution of Oswald, but thoroughly admissible for his defense. Let us be clear, then: *if* Oswald had lived and went to trial, his defense would have been entitled to view the photos and to hire an expert to inspect them. If this expert found anything on the photos and x-rays that suggested there was more than one shooter, or that the shots were fired from somewhere other than behind, Oswald’s defense would have been free to enter the photos into evidence, submit them before a jury, and have their expert give his opinion.

But Jack Ruby deprived Oswald of his life, and Earl Warren deprived Oswald of a fair trial (in the court of public opinion). The Warren Commission asked the President of the American Bar Association, Walter E. Craig, to advise the commission whether “*the proceedings conformed to the basic principles of American justice.*” There is no indication Warren ever told Craig he’d decided to keep the medical evidence away from anyone who might be able to interpret them.

And there’s yet another reason to believe Warren’s decision to withhold the photos was inappropriate. While Warren was the sole commissioner to view the photos, and was supposed to report back on what he saw to the other commissioners, he was not accompanied by an expert when he viewed the photos, and was by no means qualified to offer an expert opinion on what he saw. The circumstances undoubtedly called for an expert witness. Waltz defines an expert witness as someone whose “*opinions, inferences, or conclusions depend on a special skill or training not within the ordinary experience of lay jurors.*” He also states that “*it has generally been true that an expert witness must first describe the data on which his or her opinion, inference, or conclusion is based or, in the alternative, the witness must testify in response to a hypothetical question that sets forth the underlying data.*” Warren created no record detailing why he was expert enough to interpret the photos, and what methodology he used in interpreting them. It seems clear, therefore, that if Oswald had been tried in a court of law, and been convicted, after the presiding judge had behaved like Warren and prevented the autopsy evidence from even being examined, Oswald’s conviction would have been overturned.

Ironically, the court over-turning Oswald’s conviction might very well have been Warren’s own.

Dox Back Wound Drawing/ Autopsy Photo Comparison

Dox Drawing,
HSCA Exhibit
F-20

Fox photograph matching Dox drawing

At left: HSCA Figure 5, a blow-up of the backwound. If one assumes the head is at the top when measuring, as one normally would, the wound is wider than tall. Thus, the measurement at autopsy of 7 x 4 represents 7mm wide X 4mm in length.

Dox Back Wound/Fox Autopsy Photo Comparison

Confirmation that Warren should not have withheld the autopsy photos in 1964 came in 1978 when the HSCA released a tracing by artist Ida Dox of an autopsy photo of the president's back, along with a blow-up of the wound taken from the actual photo. These showed the wound depicted at the base of the neck in the Rydberg drawings to be, well...in the back, where Boswell marked it on the face sheet on 11-22-63.

But that's not the only reason this tracing is important.

Since the back wound tracing is a near-exact likeness of an alleged autopsy photo first printed by writer David Lifton, the release and publication of this tracing strongly suggests that the autopsy photos made available to the research community by former Secret Service agent James Fox are indeed copies of the originals in the National Archives.

With this in mind, then, we can compare the photo to the tracing/drawing, to see if anything was left off. When one does that one finds that the chief difference between the Fox photo and the Dox drawing

is that a small mark near the bullet entrance, apparently dried blood, has been left off the drawing. There is also what appears to be a fold in the back of the neck at the top of the ruler in the drawing, that is unseen in the photo. Now, these could both be innocent mistakes. It is interesting, nonetheless, that both these mistakes helped the HSCA with its argument that there was one back wound, near the neck, consistent with a shot from the Texas School Book Depository.

That the wound in the drawing is clearly wider than tall, however, is a bit more problematic. The measurements on Kennedy's face sheet for this wound were 7 by 4. This suggests, then, that it was in fact 7 mm wide by 4 mm long, and the exact opposite dimensions of the wound described in Dr. Humes' testimony before the Warren Commission, and depicted in the Rydberg drawings. Since Humes was not allowed to consult the autopsy photos before over-seeing the creation of the Rydberg drawings, of course, it remains possible that he was merely confused, and that he'd created the drawings in accordance with his conclusion the bullet creating this wound had come from above.

Dr. Richard Lindenberg of the Rockefeller Commission medical panel had no such excuse. After inspecting the photos in 1975 he wrote a report describing the back wound in the photo as "*7mm in width and 10 mm in length.*" But Lindenberg is pretty much alone on this.

My observation that the wound was wider than tall is shared by basically everyone to view the photo, including single-assassin theorist John Lattimer, who described the wound seen in the photo as "*6 mm x 8 mm in size, with the longer axis transverse*" (meaning wide).

Since the 15 by 6 entrance in the skull described on the face sheet was also transposed in Humes' testimony to be 6mm wide by 15mm long, and since the re-interpretation of these measurements was helpful in convincing the public the shots came from above, one might rightly wonder--hmmm--if the transposition of the measurements taken at autopsy in Humes' testimony was yet another part of the "help" offered Rankin.

It's important to remember, however, that Kennedy's entrance wound measurements were determined by the Army doctor Pierre Finck, and that Finck's precise method of wound measurement--whether he consistently listed width before length or vice-versa-- may not have been known to the Navy doctors Humes and Boswell.

So the evidence on this is unclear. It may be that Humes just screwed up.

But if he did so, he did so repeatedly. He had Rydberg place the back wound in the wrong location on the drawings. He had Rydberg draw this wound with the incorrect proportions. And he claimed he'd provided the measurements taken at autopsy to Rydberg to help him with his drawings, when he almost certainly did not...

Yep, although Humes testified that "*We had made certain measurements of the wounds and of their position on the body of the late President, and we provided these and supervised directly Mr. Rydberg in making these drawings,*" it seems clear he was either wrong about this, or gave Rydberg the wrong measurements.

Just ask the man who was taking his testimony, Arlen Specter. Humes testified on March 16, 1964. And yet Specter, in his 4-30-64 memo to Rankin, wrote "*Commission Exhibits Nos. 385, 386, and 388 were made from the recollections of the autopsy surgeons as told to the artist. Some day someone may compare the films with the artist's drawings and find a significant error which might substantially affect the essential testimony and the Commission's conclusions. In any event, the Commission should not rely on hazy recollections...*"

And just ask Rydberg. In 2001, Skip Rydberg emerged from the shadows to tell his story. He spoke to researcher Barry Keane, and made an appearance at the 2003 Lancer Conference in Dallas. Rydberg

revealed at this time that Humes did not provide him with any measurements regarding the President's wounds.

But that's not all Rydberg revealed. A 2002 article on Rydberg by Barry Keane, updated in 2007, reproduced a 3-27-64 letter of commendation provided Rydberg for the creation of his drawings. This letter, from Humes', Boswell's and Rydberg's superior, Capt. John Stover, described the circumstances of Rydberg's creation of the drawings. It reported: *"During the period 12 to 15 March 1964 you were called upon to prepare, on extremely short notice, highly technical medical illustrations, using only verbal instructions given you by officers of this Command. These illustrations were required and utilized in a presentation by this Command before a very high level agency of the United States Government. This work was performed in an outstanding fashion, in a most expedient manner, and utilized for the most part off-duty hours. The illustrations thus produced most accurately depicted the situation required."*

The "situation required," not the "reality observed"...

And should that not be telling enough, there's also this. When Rydberg asked Dr. Boswell in May, 1968, for a recommendation, Boswell wrote back that he was *"somewhat circumspect about putting anything in writing or discussing this due to continuing controversy."*

Hmmm... We have good reason, then, to think Humes' "mistakes" were not only not mistakes, but deliberate misrepresentations of the evidence.

It did seem a bit of a coincidence that his "mistakes" all helped the Warren Commission sell that Oswald acted alone.

Well, then why would he specify in his testimony that the autopsy photos would better reflect the President's wounds?

Well, the thought occurs that he was having second thoughts...

Well, then, what about Arlen Specter, the man who urged the doctors to create the drawings, then took their testimony, then put the Rydberg drawings into evidence? If he knew the drawings were inaccurate, why did he later ask that they be compared to the autopsy photos?

Was he having second thoughts as...well?

What was his role in all this?

Back Wound in Motion

1. Warren Commission Exhibit 385, March 16, 1964

2. A photo from the June 1, 1964 New York Times, courtesy KRLD, of the May 24, 1964 re-enactment. Note the chalk mark location.

3. Above: Warren Commission Exhibit 903, from Senator Specter's website. The neck entrance in this trajectory was said to "approximate" the chalk mark location...

3-5. The trajectory analysis conducted by Arlen Specter after the May 24, 1964 re-enactment.

(4. Left)... even though the trajectory passed inches above the mark... (5. Above)... even when the stand-in leaned forward

6. CE 385, published November 24, 1964.

Back Wound in Motion

As we've seen, the Rydberg drawings were made at the request of the Warren Commission. As we've seen, Chief Justice Earl Warren prevented anyone from checking their accuracy.

This should lead us to conclude, then, that, as of May 24, 1964, the day of the Warren Commission's re-enactment of the shooting, the wound locations depicted on the Rydberg drawings were presumed to have been accurate.

This raises an intriguing question...why weren't they used in the re-enactment? I mean, news photos of the re-enactment, published in, among other places, the New York Times, make it clear as day that on May 24, 1964, more than two months after the Rydberg drawings had been placed into evidence as the official representations of the president's wounds, those running the re-enactment had relied upon other sources when placing a chalk mark on the back of the stand-in for President Kennedy, in order to designate the wound location.

Well, why was this done?

Well, the thought occurs that someone--in this case, Warren Commission Junior Counsel Arlen

Specter--was trying to be accurate. An April 30, 1964 Specter memo, after all, admitted that, in opposition to Dr. Humes' sworn testimony, and in opposition to Specter's subsequent words in the Warren Report, the Rydberg drawings "*were made from the recollections of the autopsy doctors as told to the artist.*"

The measurements on the face sheet were not used in the creation of the Rydberg drawings, and Arlen Specter knew it. It seems likely, then, that he wanted to see for himself if his single-bullet theory made sense--when using the actual locations of Kennedy's wounds.

In any event, the Warren Report says that for the re-enactment "*The wounds of entry and exit on the President were approximated based on information gained from the autopsy reports and photographs.*" Well, this is curious. Which photographs? Certainly not the ones Chief Justice Warren withheld from the doctors?

Oh, yeah? Specter, in his 2000 autobiography, *Passion for Truth*, finally shed some light on this matter. He admitted that on the day of the re-enactment in Dallas he was shown an autopsy photo of the back wound by a member of the Secret Service, Thomas Kelley. (The Saturday Evening Post had mentioned Kelley's name in regards to this incident in 1967 and Kelley had admitted his role to researcher Harold Weisberg a few years later.) While Specter didn't say he consulted this photo before approving the chalk mark on the jacket of the stand-in, one can only assume he used it to confirm its location.

Specter and Kelley's use of the photos wrongly denied them in their passion for truth can only be considered admirable. And yet, they sought to hide this from the public and commission when Kelley testified on 6-4-64.

When one looks at the re-enactment photo published in the New York Times and re-printed in the Doubleday edition of the Warren Report, it is clear that a bullet passing through the chalk mark on the President's stand-in's back and continuing on to hit Connally's stand-in in his armpit would most likely exit from the President's stand-in's chest, and not his throat. Specter had seen the Zapruder film. He *knew* Kennedy wasn't leaning forward before the first shot. He *knew*, for that matter, that the theory he was testing left no room for deflection and he *knew*--from the photo Kelley showed him--that the chalk mark was accurate and that the wounds didn't align.

It is truly troubling, then, that on June 4, 1964 Thomas Kelley testified that the basis for the chalk mark used during the re-enactment was a photograph of CE 386, the Rydberg drawing depicting an entrance at the base of Kennedy's neck. As shown on the slide above, the entrance on this drawing was inches away from the entrance used during the re-enactment.

That Kelley's inaccurate testimony was no simple mistake becomes clear, moreover, once one realizes that the man taking his testimony, and leading him to make such a claim, was someone who undoubtedly knew better--you guessed it, Arlen Specter.

And it's even worse than that. Not only did Specter exact false testimony from Kelley regarding the source of the chalk mark used in the re-enactment, he asked Kelley if Exhibit 386 was the "*basis for the marking of the wound on the back of the President's neck*" when he knew full well this mark was on the back.

This obvious deception suggests, then, that Kelley was covering for Specter, and keeping from the record that Specter had looked at an autopsy photograph that proved the Rydberg drawings--already part of the record--inaccurate.

As FBI agent Robert Frazier, only moments later, told Commissioner Allen Dulles that the location of the chalk mark used in the re-enactment was determined by the measurements on the face sheet, Kelley's lie may also have been designed to hide that these measurements proved the wound Specter

had taken to claiming was on the back of Kennedy's neck...was really inches lower on his back.

Arlen Specter: Back to Back and Face to Face

Above, left: an FBI photo rescued from the Archives by John Hunt. Here, Specter has the FBI stand-in leaning further forward than photos of the assassination show Kennedy leaning, and the back wound location, marked by the chalk, is still inches below the trajectory proposed by Specter.

Above: CE 903. Is it a coincidence then that Specter chose another photo, one that completely fails to show the back wound location, to demonstrate his theory to the Warren Commission?

At left: yet another photo from Specter's re-enactment. Note the shock on his face as he realizes the single-bullet theory he proposes makes no sense when one takes into account the actual wound locations.

Arlen Specter: Back to Back and Face to Face

That Arlen Specter was willing to cut corners to prop up his single-bullet theory is confirmed, moreover, by further examination of the FBI photos of the May 24, 1964 trajectory analysis. In one photo the Kennedy stand-in is seen leaning as far forward as one might possibly conceive Kennedy was leaning before he was shot. And yet the trajectory rod held by Specter aligning Connally's back wound with Kennedy's throat wound passes inches above the chalk mark designating the location of Kennedy's back wound. A second photo is taken from the opposite angle; this one, however, only shows the JFK stand-in from the front and gives little indication of where the trajectory rod passes in relation to the back wound.

That Specter opted to have this second photo submitted into evidence as Warren Commission Exhibit CE 903, as the one and only official depiction of the single-bullet theory, when this photo fails to even show the location of the back wound, speaks volumes, IMO.

(When shown the images on the slide above, single-assassin theorist John McAdams reacted in a typically dismissive manner. On 1-16-2010, on the alt.aassassination.jfk newgroup, he wrote: *"Specter pretty much had it nailed. The rod he has placed is very close to the true trajectory, probably as close as it can be without getting a rapier and running through the guys in the car."* McAdams sidestepped, of course, that the problem was not that the rod was at the wrong angle, but that the rod was placed at the proper angle, and connected Connally's back wound to Kennedy's throat wound, but somehow still passed inches above the chalk mark designating the location of Kennedy's back wound.)

There are still other curious details about the May 24 re-enactment. For one, Specter used Connally's actual jacket in the re-enactment in order to establish the entrance location on *his* back, but disregarded the entrance location on Kennedy's jacket, even though, according to both the 1964 Warren Commission testimony of Thomas Kelley and the 1977 testimony of Lyndal Shaneyfelt in a civil suit brought by Harold Weisberg, the coat was at their disposal during the re-enactment.

It is also suspicious that no attempt was made to measure the right to left trajectories of bullets entering the car from the sniper's nest, while the car traveled down Elm. This allowed the commission and its experts to say the alignment of Kennedy with Connally was close enough without their having to make any actual calculations. This was a little too convenient.

Specter's presentation of the trajectory analysis in the Warren Report is also quite suspicious. At one point he acknowledges that the FBI measured the approximate trajectory needed to support the single-bullet theory during the May 24, 1964 re-enactment, and that this angle was then compared against the locations of the President's and Connally's wounds. Reflecting the testimony of the FBI's Lyndal Shaneyfelt, who'd asserted that the rod representing the single-bullet trajectory in the photo passed through a position on the back of the stand-in *"approximating that of the entrance wound,"* Specter then concludes that *"the angle was consistent with the trajectory of a bullet passing through the President's neck and then striking Governor Connally's back...The alinement of the points of entry was indicative and not conclusive that one bullet hit both men...Had President Kennedy been leaning forward or backward, the angle of declination of the shot...would have varied...The angle...was approximately the angle of declination reproduced in an artist's drawing...made from data provided by the autopsy surgeons."*

Specter was thus citing CE 385, which he knew to have been created without Rydberg's having access to the autopsy measurements, and which he knew to be inaccurate after viewing the photo of Kennedy's back wound, as support for the single-bullet theory central to the commission's single-assassin conclusion.

When one considers that, should Specter have returned to Washington and informed the Commission that their operating premise of Oswald's sole guilt was made doubtful by his failure to get a couple of wounds to align--and that he'd used evidence expressly denied him to make this determination--his career would have been in jeopardy, then one can see how easy it was for him to decide the trajectory connecting Connally's and Kennedy's wounds was "close enough," and get Kelley and others to play along. Specter was, after all, a mere 33 year old assistant district attorney at the time. He was by no means an expert in forensic pathology or wound ballistics. And besides, the proposal for the re-enactment (contained in an April 27 memo by Norman Redlich) promised chief counsel Rankin and the Commission that the point of the re-enactment was not to establish the facts *"with complete accuracy, but merely to substantiate the hypothesis which underlies the conclusions that Oswald was the sole assassin."*

It is said that behind every great man is a crime. One might grant, then, that Senator Arlen Specter's

“crime” was one of rejecting his self-identified “passion for truth” for the benefit of his career. An old story, indeed... and as American as apple pie...

Arlen's Spectre

It's ironic, then, that Specter's failure to tell the Commission that the wound he saw on the autopsy photograph was on the President's back, and not neck, was to haunt the old age of another prominent Republican and "great man," Commission member and future President Gerald Ford. In 1998, as a result of records released by the ARRB, it was discovered that Ford was the commissioner to have the words "*a bullet had entered his back slightly above the shoulder*" in a draft of the Commission's report changed to "*a bullet had entered the back of his neck.*"

This news even made the papers. When asked about the change, Ford explained to a reporter that he believed this wording was more precise. Many conspiracy theorists, by then familiar with the back wound photo published in best-selling books, however, scoffed at Ford's words, and assumed him to have been lying through his dentures.

But I'm not so sure. Perhaps Ford had been confused by the Rydberg drawings, which did indeed depict the back wound as residing at the base of the neck.

And perhaps there was more to Ford's confusion than just his looking at a drawing and assuming it was accurate. When one reads Chapters Two and Three of the Commission's report, the chapters to which Specter contributed, it seems incredibly clear that someone, almost certainly Specter himself, but perhaps his immediate superior Norman Redlich, who also worked on these chapters, went back at the last moment and changed its references to a back wound to references to a neck wound. And missed a couple... (In his 2000 memoir *Passion for Truth*, Specter claimed that Redlich "*essentially let my work stand, especially the key points about the assassination and the Single-Bullet Conclusion.*")

In any event, these changes were almost certainly made before Ford ever saw the chapter. It seems likely, then, that Ford changed the wording of that one passage to bring it back in line with the other (inaccurate) references to the wound within the report, and that he was not consciously lying when he did so.

I mean, just look at this... Here are the diverse and confusing references to the wound in Chapters Two and Three of the report. And yes, these are all references to the same wound, a wound the primary writer of these chapters, our man from Philadelphia, Arlen Specter, knew to be inches below the shoulder line after viewing the back wound photo. (Page numbers come from the version of the report on the National Archives website)

- *One bullet passed through the President's **neck** p. 48*
- *The autopsy also disclosed a wound near the base of the back of President Kennedy's **neck** p.61*
- *The nature and characteristics of this **neck** wound p.61*
- *The President's **Neck** Wounds p.87*
- *another bullet wound was observed near the base of the back of President Kennedy's **neck** p.88*
- *in its path through the President's **neck** p.88*
- *By projecting from a point of entry on the rear of the **neck** p.88*
- *Concluding that a bullet passed through the President's **neck** p.88*
- *the doctors at Bethesda Naval Hospital rejected a theory that the bullet lodged in the large muscles in the back of his **neck** p.88*
- *the surgeons were unable to find a path into any large muscle in the back of the **neck** p.88*

- *This led to speculation that the bullet might have penetrated a short distance into the back of the **neck** p.88*
- *Dr. Perry did not know about either the wound on the back of the President's **neck** or the small bullet-hole wound in the back of the head p.90*
- *After reviewing the path of the bullet through the President's **neck** p.91*
- *the experts simulated the **neck** p.91*
- *The autopsy disclosed that the bullet which entered the back of the President's **neck** p.91*
- *After the examining doctors expressed the thought that a bullet would have lost very little velocity in passing through the soft tissue of the **neck** p. 91*
- *A photograph of the path of the bullet traveling through the simulated **neck** p. 91*
- *The clothing worn by President Kennedy on November 22 had holes and tears which showed that a missile entered the back of his clothing in the vicinity of his lower **neck** p.91*
- *all the defects could have been caused by a 6.5-millimeter bullet entering the back of the President's lower **neck** p. 92*
- *The **back** of the stand-in for the President was marked with chalk at the point where the bullet entered p. 97*
- *The position of President Kennedy's car when he was struck in the **neck** p.97*
- *the point of impact on the President's **back** p. 98*
- *the next point at which the rifleman had a clear view through the telescopic sight of the point where the bullet entered the President's **back** p.98*
- *the President was probably shot through the **neck** between frames 210 and 225 p. 105*
- *the bullet which passed through the President's **neck** p. 105*
- *The bullet that hit President Kennedy in the **back** and exited through his throat p. 105*
- *at the time when the President was struck in the **neck** p. 105*
- *which followed the shot which hit the President's **neck** p. 106*
- *A surveyor then placed his sighting equipment at the precise point of entry on the back of the President's **neck** p. 106*
- *That angle was consistent with the trajectory of a bullet passing through the President's **neck** p. 106*
- *the angle of that shot could have accounted for the wounds in the President's **neck** p. 106*
- *of a test simulating the Governor's chest wound with the **neck** and wrist experiments p.107*
- *concluded that it was probable that the same bullet passed through the President's **neck** and then inflicted all the wounds on the Governor p. 109*
- *Referring to the President's **neck** wound p. 109*
- *Thus, the Governor's wrist wound suggested that the bullet passed through the President's **neck** p. 109*
- *the bullet which entered the Governor's chest had already lost velocity by passing through the President's **neck** p. 109*
- *as to whether the same bullet did or did not pass through the President's **neck** p. 109*
- *it was probable that the same bullet traversed the President's **neck** p. 109*
- *After a bullet penetrated President Kennedy's **neck** p. 109*
- *From the initial findings that (a) one shot passed through the President's **neck** p. 111*
- *Agent Bennett stated: ... I looked at the **back** of the President. I heard another firecracker noise and saw that shot hit the President **about four inches down from the right shoulder** p. 111*
- *It is possible, of course, that Bennett did not observe the hole in the President's **back** p.111*
- *30 to 45 frames (approximately 2 seconds) later than the point at which the President was shot*

in the **neck** p. 112

- from 4.8 to 5.6 seconds between the shot which struck President Kennedy's **neck** p. 115
- That approximation was most probably based on the earlier publicized reports that the first shot struck the President in the **neck** p. 117

Thus, the back wound was officially moved to the back of Kennedy's neck by a series of mistakes and/or wishful thoughts and/or deliberate fabrications, first by Humes and Boswell in the original creation of the Rydberg drawing, then by Warren in his withholding of the photographs, then by Specter in his failing to report the inaccuracy of the Rydberg drawings, and his pushing that the wound was on the neck in the report, and finally by Ford and his fellow commissioners in their changing certain passages of the report to be consistent with Specter's (and possibly Redlich's) misrepresentations. Truth by committee had become a lie.

Specter and the Strap Muscles

Now I know some out there would prefer I give one-time Senator Specter the benefit of the doubt. And I would prefer to do so myself. But I just can't. If there had been but one or two misstatements or misrepresentations in Specter's chapters in the Warren Report and subsequent statements regarding his work for the commission, one might grant he'd simply made a mistake as to the location of the back wound in the photo shown him by Kelley, and had failed to double-check Humes' measurements to see where the wound was actually located.

But, sadly, this is not the case. There is, instead, a whole slew of misstatements and misrepresentations, all contributing to Specter's "Single-Bullet Conclusion."

Consider the presentation of the back wound bullet trajectory in the Warren Report... On page 90 of the paperback, it claims "*The autopsy examination further disclosed that, after entering the President, **the bullet passed between two large muscles**, produced a contusion on the upper part of the pleural cavity (without penetrating that cavity), bruised the top portion of the right lung and ripped the windpipe (trachea) in its path through the President's neck.*" On page 91, it appears to build upon this, and relates: "*While the autopsy was being performed, surgeons learned that a whole bullet had been found at Parkland Hospital on a stretcher which, at that time, was thought to be the stretcher occupied by the President. This led to speculation that the bullet might have penetrated a short distance into the back of the neck and then dropped out onto the stretcher as a result of external heart massage. Further exploration during the autopsy disproved that theory. **The surgeons determined that the bullet had passed between two large strap muscles and bruised them without leaving any channel**, since the bullet merely passed between them.*"

Upon reading this, one would undoubtedly come to believe the two large strap muscles in the second quote are the two muscles mentioned in the first quote, and were on the back of Kennedy's neck.

And one would be right. While taking the testimony of Dr.s Baxter and McClelland, Specter made reference to the bullet's passing between the "*strap muscles of the shoulder*" and "*strap muscles on the posterior aspect of the President's body*," respectively. But there are no strap muscles in the shoulder or on the posterior aspect of the body. The autopsy report makes no mention of these muscles. It notes, instead, that "*there is considerable ecchymosis of the strap muscles of the right side of the neck and of the fascia about the trachea adjacent to the line of the tracheotomy wound.*" This would be at the front of the neck.

But you needn't take my word for it. In his testimony before the Warren Commission, Dr. Humes

specified that the bruised strap muscles which helped lead him to conclude the throat wound was an exit were on *"the right anterior neck inferiorly"* (i.e. the lower right quadrant of the front side of the neck). Dr. Humes explained that the bruising on these muscles next to what he initially believed was a simple tracheotomy incision was far more extensive than the bruising next to the incisions on Kennedy's chest, and that this led him to suspect these neck bruises preceded the emergency procedures performed in Dallas, and were in fact caused by a bullet. Humes said NOTHING about a bullet sliding between two muscles on the back of Kennedy's neck or shoulder. In fact, when discussing the entrance on Kennedy's neck/back, he said just the opposite, and described a defect in the underlying tissue, but no evidence for a pathway between two muscles. He testified *"When the tissues beneath this wound were inspected, there was a defect corresponding with the skin defect in the fascia overlying the musculature of the low neck and upper back."* He then added *"We were unable, however, to take probes and have them satisfactorily fall through any definite path at this point."*

(It should be noted, moreover, that the doctor doing this probing was Dr. Pierre Finck and that Finck later confirmed Humes' testimony. On January 24, 1969, when testifying during the trial of Clay Shaw, when asked about his failure to "satisfactorily" find a "definite path" from the back wound through Kennedy's neck, Finck testified: *"I couldn't introduce this probe for any extended depth."* He was then asked *"how far in this probe went"* and responded *"The first fraction of an inch."*)

It should probably be mentioned here that *"the musculature of the low neck and upper back"* through which Humes and Finck could not find a path was the trapezius muscle, a flat sheet of muscular fibers covering the back of the neck and shoulder. A bullet could not slide between two muscles in this area because the area was covered by but one. (Should one not believe me on this, one should look [here](#).) The trapezius muscle covers so much area, in fact, that anatomists break it up into four parts when describing it in anatomy books. Kennedy's back wound, moreover, was in part three, the thickest and strongest of the four parts of the trapezius muscle.

It follows then that Humes had strong reasons to conclude, as he did on the night of the autopsy, that the bullet creating the back wound had failed to enter the body. Perhaps the cartridge for this bullet had been undercharged. Perhaps there had been a misfire.

When one digs further, moreover, and reads the Warren Commission testimony of Dr. Malcolm Perry, one finds that Dr. Humes continued to doubt that a bullet had entered Kennedy's body at the back wound location even after Dr. Perry had told him of the throat wound, which could serve as an exit for the bullet. According to Perry:

*"He inquired about, initially, about the reasons for my doing a tracheotomy, and I replied, as I have to you, during this procedure, that there was a wound in the lower anterior third of the neck, which was exuding blood and was indicative of a possible tracheal injury underlying, and I did the tracheotomy through a transverse incision made through that wound, and I described to him the right lateral injury to the trachea and the completion of the operation. He subsequently called back--at that time he told me, of course, that he could not talk to me about any of it and asked that I keep it in confidence, which I did, and he subsequently called back and inquired about the chest tubes, and why they were placed and I replied in part as I have here. It was somewhat more detailed. After having talked to Drs. Baxter and Peters and I identified them as having placed it in the second interspace, anteriorly, in the midclavicular line, in the right hemithorax, **he asked me at that time if we had made any wounds in the back.** I told him that I had not examined the back nor had I knowledge of any wounds of the back."*

So where did Specter get that a bullet slipped between two back muscles? Simple. He either misunderstood Humes' reports and testimony (which would be problem enough), or he completely made it up.

I currently suspect the former. On March 12, 1964, a few days before Humes testified, Specter stopped by Bethesda Naval Hospital, and discussed the basic facts of the autopsy with Humes and Boswell. Intriguingly, Specter's memo on this meeting portends his inaccurate representation of the strap muscles in the Warren Report. He relates: *"Dr. Humes and Dr. Boswell were shown the Parkland report which describes the wound of the trachea as 'ragged,' which, they said was characteristic of an exit rather than an entrance wound. Dr. Humes and Dr. Boswell further said that it was their current opinion that the bullet passed in between two major muscle strands in the President's back and continued on a downward flight and exited through his throat. They noted, at the time of the autopsy, some bruising of the internal parts of the President's body in that area but tended to attribute that to the tracheotomy at the time. Dr. Humes and Dr. Boswell stated that after the bullet passed between the two strands of muscle, these muscle strands would resist any probing effort and would not disclose the path of the bullet to probing fingers, as the effort was made to probe at the time of the autopsy."*

Now, some might read Specter's memo and see this as evidence Dr.s Humes and Boswell lied to him, but then retreated from their lies in their testimony. But I suspect instead that Specter was confused by his notes on the meeting, and had mistakenly come to believe the bruised strap muscles were on Kennedy's back, not throat.

Let's re-read the key section: *"Dr. Humes and Dr. Boswell further said that it was their current opinion that the bullet passed in between two major muscle strands in the President's back and continued on a downward flight and exited through his throat. They noted, at the time of the autopsy, some bruising of the internal parts of the President's body **in that area** but tended to attribute that to the tracheotomy at the time."*

If one read the words *"in that area"* as a reference to the *"President's back,"* instead of as a reference to *"his throat,"* then Specter's memo is consistent with Specter's later claims the strap muscles were bruised and on Kennedy's back.

Now let's re-read the last line: *"They noted, at the time of the autopsy, some bruising of the internal parts of the President's body **in that area** but tended to attribute that to the tracheotomy at the time."*

Well, why would the doctors have attributed bruised back muscles to a tracheotomy?

It seems clear, then, from Specter's own memo, that the doctors said the bruised strap muscles were on Kennedy's throat, and that Specter came away from their meeting thinking the *"two major muscle strands"* they'd said were bruised were on Kennedy's back.

Perhaps he couldn't accept that a high-velocity bullet had passed through the President's back and throat without leaving a discernible path through his back muscles... Perhaps he'd found it easier to believe it had slipped between two back muscles... Perhaps he'd failed to grasp there was but one muscle in the area...

Or perhaps his confusion was just a smoke screen...

Specter Fails The Lie Detector

At left and above: CE 385 and CE 386, respectively. These drawings were entered into evidence by Warren Commission Counsel Arlen Specter on March 16 1964, as depictions of President Kennedy's wounds.

Realizing that the Commission's conclusions could be cast into doubt should the autopsy photos prove the wound at the base of Kennedy's neck in the drawings to have been further down his back, Specter wrote a 5-12-64 memo reporting that the Commission "should be certain... the photographs... confirm the precise location of the wound of entrance in the upper back of the President as depicted in Commission Exhibits 385 and 386." He was shown the photo above and at right on 5-24-64. And yet, in his chapters in the Warren Report, submitted a few weeks later, he called the wound he'd just called a wound in the "upper back" a wound "on the back of the President's neck." In 1999, Specter re-inspected this photo. And yet, in his memoirs, released 2000, he once again presented the wound in the photo as a wound "on the back of the neck." L-I-A-R.

Specter Fails The Lie Detector

When one reads Specter's post-Warren Commission comments on its investigation, unfortunately, his slipperiness becomes readily apparent.

Let's start with an article on Specter by Gaeton Fonzi published in the August 1966 edition of Greater Philadelphia Magazine. Here, Specter aggressively defended his work for the Warren Commission. Fonzi maintained throughout the article, however, that many of the questions regarding Kennedy's autopsy could have been cleared up if Specter had viewed the autopsy photographs. When asked about this, and why he hadn't been more aggressive about viewing the photographs, for that matter, Specter is reported to have *"appeared visibly disturbed"* and to have stammered for awhile before responding *"The commission decided not to press for the x-rays and photographs."* According to Fonzi, Specter then became apologetic, and said *"Have I dodged your question?... Yes! I've dodged your question."* He then gave a more detailed response: *"The Commission considered whether the x-rays and photographs should be put into the record and should be examined by the Commission's staff and the Commission reached the conclusion that it was not necessary..."*

Specter had thereby concealed that he had in fact been shown a photo of Kennedy's back wound by a member of the Secret Service, and that he'd opted not to report this to the commission.

His silence served another purpose as well. At another point in the article, after discussing Warren Commission Exhibit 385, a Rydberg drawing depicting the path of the bullet through Kennedy's neck, in which the bullet enters at the base of Kennedy's neck, Fonzi asked Specter to explain why so many witnesses, including the FBI agents present at the autopsy, claimed this wound was in the shoulder. He then wrote *"Specter says it's possible that the whole thing is just a matter of semantics. 'It's a question of whether you call this point shoulder, base of neck, or back. I would say it sure isn't the shoulder, though I can see how somebody might call it the shoulder.'"*

Now, admittedly, it's not crystal clear that when Specter said "this point" he was pointing to the entrance location depicted in CE 385, but the implication seems clear. If this is so, moreover, it seems equally clear that Specter was blowing smoke, trying to convince Fonzi that the confusion over the wound's location could be purely semantics, when he knew for certain--from sneaking a peek at an autopsy photo--that the wound depicted at the base of the neck on CE 385 was really inches below on the shoulder.

In late 2012, after the passing of both Fonzi and Specter, Fonzi's wife made the tapes of their interviews available to the public via the Mary Ferrell Foundation website. These tapes confirm Specter's dishonesty. In three separate interviews--in over two hours of discussion--Specter never once admits that he'd been shown a photo of Kennedy's back wound, or even that the wound was on Kennedy's back. When interviewed on 6-28-66, he told Fonzi *"The bullet entered the back of the neck between two strap muscles."* This, as we've seen, was baloney. But he goes further, embarking on the discussion of semantics Fonzi mentioned in his article, and then proceeding to describe it as a neck wound whenever possible, at least five times by my count.

Specter's deceptiveness, in fact, hits rock bottom in the second of these interviews. On 6-29-66, when discussing the single-bullet theory, the holes on the President's clothes, and the strange fact that Governor Connally's clothes were cleaned and pressed before being made available to the Commission, Specter asserted *"The real question on the holes are the direction."* He then injected *"We didn't see the President; we didn't see the pictures."* Fonzi hadn't asked the question, but Specter was volunteering that "we" didn't see the autopsy photos of the President, perhaps to conceal that "he" had, in fact, seen the one picture needed to determine the location of the President's back wound.

And that's not the most revealing of Specter's deceptions. Perhaps inadvertently, Fonzi's tapes offer real insight into Specter's mindset--not only that he was lying, but why he was lying. In his 6-29-66 interview with Fonzi, when discussing Edward Epstein's book *Inquest*, in which Epstein suggested the Warren Commission investigation had been a whitewash performed in the name of the national interest, the politician in Specter came out, and he played to the grandstands. He told Fonzi: *"It was not my function to decide the national interest. It was not Lyndon Johnson's function to decide the national interest. The national interest is decided in a democratic society by the free flow of facts into the truth. And any time any individual sets himself up to decide what is justice or what is the national interest, he's kidding himself. I'm not about to follow anybody's orders on that. They want to run their Commission. tell a bunch of lies, let them go ahead and run their Commission. They can't ask me to work for them."* Specter, to his mind, was independent, and beyond the corrupting influence of Washington.

Now compare that to what Specter told Fonzi in their final interview on 7-8-66. When discussing the Commission's decision not to inspect the autopsy photographs, Specter at first said *"As assistant counsel for the Commission, I do not think that it is appropriate for me to make a public statement disagreeing with the conclusion of the Commission on this question."* Then, when asked if he'd thought of resigning when the autopsy photos and x-rays were withheld, he responded: *"The decision of the Commission that the photographs and x-rays were not necessary in order for the Commission to arrive at a conclusion was not an egregious abuse of their discretion in light of the fact that they had substantial evidence on this question from eyewitness reports, from the highly qualified autopsy surgeons who had personally observed the President's body, a detailed report of the characteristics of the wounds, and there were important countervailing considerations which led the Commission to its conclusion that the films were not necessary in the light of the question of taste and the stature of the young American president whose memory will be regarded in the light of a smiling, handsome, erect, president, as opposed to a mutilated corpse with half his head shot off."* Specter was pretending, of course, that everything the Commission looked at would automatically become available to the public,

which he knew to be untrue.

But he continued from there, and ultimately revealed more of himself than he possibly could have intended. He insisted *"The President of the United States didn't want Arlen Specter to conduct the investigation of the assassination of President Kennedy, the President of the United States appointed the Commission to do that job..."* So there it was--what in retrospect reads like a confession that he'd chickened out--that he'd had the opportunity to make a difference but was overwhelmed by the feeling he'd be out of line in doing so. He then continued *"...and if the Commission had done anything improper or made any effort to suppress material evidence or to mislead the American public in any way, that is the area where any honest public servant would be called upon to search his conscience for his resignation, not on discretionary questions as to whether the Commission ought to have additional evidence on the same point."*

Well, my God. Feel free to read that again. Specter suggested that it would have been wrong for him to help the Commission if he felt it was making a deliberate effort to mislead the public, but that it wasn't his place to raise a ruckus if the Commission was simply ignoring important evidence, as long as it was ADDITIONAL evidence, that they were free to ignore at their discretion. In other words, he was thinking like a junior partner, unwilling to argue with a senior partner. He knew the autopsy photo showed a bullet wound on Kennedy's back, not neck, but thought this photo but one piece of evidence, which the Commission would feel free to ignore. Fate looked him in the face and he blinked. He'd lawyered his way out of doing the right thing.

That Specter was worried about Fonzi's article and had chosen to deceive him is further supported, moreover, by a far-friendlier article about the Warren Commission and the medical evidence published a few weeks later, by Joseph Daughen in the 8-28-66 Philadelphia Bulletin. Here, almost as an aside, Daughen asserted *"in Dallas, a staff member who had expressed concern over the absence of the evidence was shown by a Secret Service agent a photograph purportedly representing the upper back of the President."* Hmmm... Specter was interviewed for this article. Clearly, then, he had told Daughen of his viewing the photo in Dallas. Well, why hadn't he told this to Fonzi, when the commission's failure to view the photos was central to Fonzi's article?

Well, the thought occurs that that's it, right there. The viewing of the photos was central to Fonzi's article. If then-District Attorney Specter had told Fonzi he'd seen the photo then Fonzi would have insisted he describe what he saw. And Specter, presumably, was hoping to avoid that. (Notice how the compliant Daughen not only fails to name Specter as the staff member who'd viewed the photo of Kennedy's upper back, but fails to describe where the wound was in this photo.)

In any event, in the 10-10-66 edition of U.S. News & World Report, Specter finally admitted he'd been shown one of Kennedy's autopsy photos. He didn't exactly come clean, however. Nope, true to form, he side-stepped the fact the photo shown him by Kelley didn't match the Rydberg drawings by claiming *"It showed a hole in the position identified in the autopsy report."* Well, of course it did. The autopsy report described a wound on Kennedy's back, and not at the base of his neck, where Specter had taken to pretending it had been. In the article, Specter then moaned that, should this wound have been on Kennedy's back below the level of his throat wound, as proposed by conspiracy theorist Edward J. Epstein, it would mean *"the autopsy surgeons were perjurers, because the autopsy surgeons placed their hands on the Bible and swore to the truth of an official report where they had measured to a minute extent the precise location of the hole on the back of the President's neck, as measured from other specific points on the body of the President."*

Well, once again, the Specter shift was in place. He defended the integrity of the doctors by claiming they'd be perjurers if the autopsy report was in error, when he almost certainly knew the problem was not with the autopsy report, but with the schematic drawings of Kennedy he--Arlen Specter--had asked

them to create. To reiterate, the measurements taken by the "autopsy surgeons" suggested the wound to have been on Kennedy's back, at or below the level of the throat wound, and *not* on the "*back of the President's neck*," where both Specter and the "*surgeons*" had taken to saying it had been. The autopsy report, moreover, said nothing about the relative locations of the back wound and throat wound.

So why was Specter suggesting otherwise? Was he playing a sneaky lawyer trick, and leading his readers to assume something he knew to be untrue?

I'd bet the farm on it. He then insisted that "*The photographs would, however, corroborate that which the autopsy surgeons testified to.*" Well, notice the language... If he meant to say that the autopsy photo he'd been shown depicted a wound at the base of Kennedy's neck, in the location suggested by the Rydberg drawings, then why didn't he just say so? And why, instead, did he claim that the autopsy surgeons testified to the accuracy of their measurements, and that the photographs corroborated these measurements? Was he trying to avoid saying that the Rydberg drawings were accurate--because he knew full well they were not?

Specter also discussed the strap muscles in this interview. He claimed that at the beginning of the autopsy the doctors found that "*a finger could probe between two large strap muscles and penetrate to a very slight extent*" a "*hole at the base of the back of the neck.*" He then pushed what clearly wasn't true--that he got this information from somewhere other than his own fertile imagination. He related that the Warren Commission testimony of the "*autopsy surgeons*" had established "*the path of the bullet through the President's neck, showing that it entered between two large strap muscles...*"

His statements in the 11-25-66 issue of Life Magazine were equally curious. He said "*Given the trajectory from the Book Depository window, the autopsy, about which I have no doubts, and the FBI report on the limousine; where, if it didn't hit Connally, did that bullet go?*" Yes, you read that right. Specter claimed he had no doubts about the autopsy. Well, maybe he didn't. But his version of the autopsy--the one where the doctors found a path between two muscles on the back of Kennedy's neck--was not the real autopsy.

I'm being facetious, of course, which sounds a lot like the substance Specter was spreading. The autopsy photo he'd been shown--the one on the slide above--depicted a wound in Kennedy's upper back, at or below the level of his throat wound. The "*trajectory from the Book Depository window*," therefore, necessitated that either 1) Kennedy was leaning sharply forward when hit, or 2) the bullet creating this wound had curled upwards upon entry. The "autopsy" about which Specter had no doubts, however, had ruled out that the bullet had struck anything upon entry. The films of the assassination studied by Specter, furthermore, proved Kennedy wasn't leaning sharply forward when hit. So what was there to have doubts about? What, Specter, worry?

Let's recall here that in his 4-30-64 memo to J. Lee Rankin, Specter urged that the Rydberg drawings be compared to the autopsy photos, and specified:

"2. THE COMMISSION SHOULD DETERMINE WITH CERTAINTY WHETHER THE SHOTS CAME FROM ABOVE. It is essential for the Commission to know precisely the location of the bullet wound on the President's back so that the angle may be calculated. The artist's drawing prepared at Bethesda (Commission Exhibit #385) shows a slight angle of declination. It is hard, if not impossible, to explain such a slight angle of decline unless the President was farther down Elm Street than we have heretofore believed. Before coming to any conclusion on this, the angles will have to be calculated at the scene; and for this, the exact point of entry should be known."

Now let's do a quick replay. On 4-30-64, Specter admitted that he'd thought the trajectory in Rydberg drawing CE 385 too shallow to support the shooting scenario he'd proposed. Well, this is the same as his saying he thought the neck wound too low to support Kennedy and Connally being hit by the same

bullet at the time he'd assumed they'd been hit. On 5-24-64, however, he was shown a photo of Kennedy's back, in which the wound was revealed to have been approximately two inches lower on Kennedy's back than in Rydberg drawing CE 385. This meant it was far too low to support the shooting scenario he'd proposed. So how did Specter respond to this challenge? Did he change his scenario? Nope. On 6-4-64 he took testimony from FBI agent Lyndal Shaneyfelt in which Shaneyfelt purported that the trajectory from the sniper's nest approximated the trajectory through Kennedy's neck in CE 385--the drawing which Specter now knew to be inaccurate. Specter then pushed this nonsense in the Warren Report. He then defended his work by telling Life Magazine he had no doubts about the autopsy, and that the trajectory from the sniper's nest--the trajectory he'd thought incompatible with CE 385, and would have to have thought thoroughly incompatible with the photo he'd been shown--contributed to his faith in his scenario.

Well, hello! Do I have to spell it out? Specter was L-Y-I-N-G!

An 11-26-66 UPI article (found in the Milwaukee Journal) was also given the Specter touch. Taking note of Dr. Boswell's recent claim the photos could dispel the controversy over the President's wounds, the article reported that "*Specter said he had not seen the autopsy pictures*" but that he had nevertheless conceded "*If it keeps up, you may get a look at them.*" Note that Specter said he had not seen the "pictures" (plural), and that this allowed him to avoid admitting that he'd seen one "picture" (singular).

Specter did discuss his viewing the photo of Kennedy's back soon thereafter, however. In the January 14, 1967 issue of the Saturday Evening Post, he is quoted as claiming "*It showed the back of a body with a bullet hole, apparently of entry, where the autopsy report said it was.*" Well, there it is again. Notice the language... Notice how Specter once again steers clear of saying that he'd looked at a photo of the President's back, and that this photo showed a wound on the back of the president's neck, and confirmed the accuracy of the Rydberg drawings.

On 12-4-68, while debating author Josiah Thompson at the University of Pennsylvania, moreover, he repeated his tall-tale about the strap muscles. According to a transcript of this conference in the Weisberg Archives, he told the students in attendance that the autopsy surgeons "*testified that there was a path through the President's neck where the bullet passed between two large strap muscles, bruised the top of the pleural cavity, bruised the top of the right lung, sliced his trachea, and exited from the front of the throat.*" After describing the wounds, he then detailed that "*We then sought to determine what would have been the velocity of a bullet entering the President's neck and exiting the President's neck.*" Well, my God. It entered the president's "neck," not back. This, clearly, was Specter's story, and he was sticking to it.

And stick to it he did. On 12-8-77, when testifying before the HSCA in executive session, Specter made at least five separate references to a wound on the back of Kennedy's neck. He never once described this wound as being on Kennedy's back. This was remarkable, moreover, seeing as the HSCA had added two of Specter's old Warren Commission memos into his testimony...which made at least five separate references to this wound...as a wound on Kennedy's back.

Yes, it's true. Specter had routinely described this wound as a back wound prior to his being shown a photo confirming it to have been a back wound, and then and only then began describing it as a neck wound.

Well, that's about as red as a red flag can get.

That Specter wasn't exactly telling the truth, the whole truth, as he'd solemnly sworn to do, moreover, is confirmed by something left out of his testimony. When asked about one of the Warren Commission memos introduced during his testimony, in which he'd asserted "*The Commission should determine with certainty*" that "*there are no major variations between the films and the artist's drawings*", he

explained that he'd believed *"it was highly desirable for the X-rays and photographs to be viewed"* at that time, in order *"to corroborate the testimony of the autopsy surgeons."* He then added *"I was overruled on the request..."*

Incredibly, he never admitted being shown the photo of Kennedy's back.

Nor was he ever asked about it... Apparently, Kenneth Klein, who'd conducted Specter's testimony, had failed to do his homework.

Or maybe there was more to it. Klein, born in Specter's home town of Philadelphia, had been hired to work for the HSCA by its original Chief Counsel, Richard Sprague, who'd worked for Specter in the Philadelphia District Attorney's Office. Many years later, for that matter, Klein went to work for Jenner and Block, the Chicago law firm of Specter's colleague on the Warren Commission, Albert Jenner.

And that's not the only curious tie between Specter and the committee. Specter's son, Shanin, just so happened to be Pennsylvania Congressman Robert Edgar's assistant on the committee. Edgar, while a liberal Democrat, was the Congressman from Pennsylvania's Seventh District, on the outskirts of Philadelphia, where the moderate Republican Specter had recently served as District Attorney, and was preparing a run for Governor. Edgar would proceed to author a dissent from the committee's report, in which he claimed its conclusion of a probable conspiracy was unjustified, and credit Specter's son Shanin and Warren Commission counsel David Belin for their assistance.

Specter and Edgar traveled in the same circles and almost certainly knew each other.

Or maybe all this means nothing. In 1986, Edgar left congress to run against Specter for U.S. Senator.

In any event, if Klein and Edgar had been on a mission to protect Specter's reputation, they were not entirely successful...because something seriously shocking happened the next year-- something that should have marked the end of Specter's political career... On 9-7-78, Dr. Michael Baden, the spokesman for the HSCA Forensic Pathology Panel, testified that from studying the autopsy photos the panel had concluded Kennedy's torso wound to have been--cut to the sound of Specter saying "oh crap"--not only not on Kennedy's neck, where Specter had long claimed it to have been, but on his back *below* the level of his throat wound.

Congressman Edgar was present for this testimony. His assistant, Specter's son, Shanin, may also have been present. The questions asked Baden by--you guessed it, Kenneth Klein--had been prepared in advance. This suggests, then, that Klein knew well in advance that Baden was gonna undercut the foundation for Specter's single-bullet theory, and that Edgar--and almost certainly his assistant, Specter's son, Shanin--knew this as well.

Let's recall here that Specter had once suggested that if this wound were below Kennedy's throat wound, well, then the autopsy surgeons were guilty of perjury.

So...does Specter call a press conference after Baden's testimony, and demand Humes, Boswell, and Finck be indicted for perjury?

No, of course not.

And does Klein call Specter to the stand and ask him to explain why, for nearly 15 years, he'd been calling a wound he'd known to have been on Kennedy's back a wound on the back of his neck?

No, of course not.

And that's not even the worst of it. If Specter had at this time come forward and said "Wow, that wound really was on Kennedy's back; I apologize for any confusion caused by my earlier descriptions of the wound," he might have escaped with a smidgen of credibility.

But instead he doubled down.

Yep, in an unbelievably suspicious move, not only did Specter fail to specify in his subsequent statements and articles that the doctors had been mistaken about the back wound location depicted on the Rydberg drawings--or apologize for his own misleading statements about this wound's location--but he continued--up till his death--to make claims about its location that are demonstrably false... He continued to claim even that the bullet creating this wound entered between two strap muscles on the back of Kennedy's neck.

It's sad but true... After becoming a U.S. Senator in 1980, Specter made very few public statements regarding the assassination. With the success of Oliver Stone's 1991 film JFK, however, he was no longer afforded this luxury. This led him to publish a response to the film in the 1-5-92 Philadelphia Inquirer. As one might expect, his response was filled with errors and misleading claims. To rebut the film's accurate depiction of Dr. Finck's testimony in the trial of Clay Shaw, in which Finck claimed the autopsists were ordered not to inspect Kennedy's neck, for example, Specter claimed: "*Finck testified under oath before the Warren Commission that an initial bullet hit Kennedy in the back of the neck, hit nothing solid, and exited from his throat - supporting the single bullet theory.*" Well, there it was again--"*back of the neck.*" Finck, of course, had said no such thing, and had responded without correction to Specter's questions regarding a "*back*" wound.

Perhaps the worst of Specter's deceptions, moreover, was this one: "*The movie mangles the facts on the single-bullet theory. The House assassinations committee, very critical of the Warren Commission on other matters, confirmed the single-bullet theory.*"

Well, this, of course, was smoke, and toxic smoke at that. Specter had previously claimed the back wound was above the throat wound, and that, if it was not, the autopsy surgeons were perjurers. The HSCA pathology panel had then determined that the back wound was in fact below the throat wound. With one exception, they'd concluded as well that the single-bullet theory was viable, should Kennedy have been leaning sharply forward when struck. Specter then seized upon this second conclusion, which in fact dismantles his single-bullet theory, as "confirmation" of the theory he'd proposed, and pushed upon the commission--entailing that the back wound was well above the throat wound.

And that was just the beginning of Specter's '92 campaign. On 5-12-92, Specter appeared before the Senate Committee on Governmental Affairs, urging that it pass a bill he'd co-authored, requiring federal agencies release as many JFK assassination-related documents as possible, and the creation of the ARRB. (His appearance can be found online in the C-Span Video Library.) He urged "*Let the facts be disclosed*" and said, of his famous single-bullet theory, that he believed it had been "*upheld*" by subsequent investigations, and would withstand further scrutiny. He then added "*If it isn't, so be it; let someone come along and disprove it.*" He failed to acknowledge that the central beam around which his theory had been constructed had long since been disproved.

Should one think this was Specter turning over a new leaf, however, one would be wrong. It was, to the discerning eye, yet another of his smoke screens, designed to hide his own failure to properly investigate the case. During this testimony he repeatedly complained that the Warren Commission did not have access to the autopsy photos and x-rays. He said this was because "*The wishes of the Kennedy family prevailed in not having those available even to the commissioners or to the staff*" and that "*They were not permitted to see them because there was a sense that they might come into the public domain.*"

This apparently came as a surprise to the Committee. As a result, a number of follow-up questions were asked on this issue. Under subsequent questioning by Sen. Carl Levin, Specter admitted that Warren himself "*may have been shown the photographs. I have reason to believe he did see them privately.*" He then injected "*but that was my area of responsibility.*" He never mentioned that he, too, had been shown

a photograph.

Well, I'll be. Specter was once again blowing smoke. His 4-30-64 memo to J. Lee Rankin, published by the HSCA in 1978, had revealed *"When Inspector Kelly talked to Attorney General Kennedy, he most probably did not fully understand all the reasons for viewing the films. According to Inspector Kelly, the Attorney General did not categorically decline to make them available, but only wanted to be satisfied that they were really necessary. I suggest that the Commission transmit to the Attorney General its reasons for wanting the films and the assurances that they will be viewed only by the absolute minimum number of people from the Commission for the sole purpose of corroborating (or correcting) the artist's drawings, with the film not to become a part of the Commission's records."*

And not only that. Earl Warren's memoirs, in which he'd admitted viewing the photos, had been available to the public since 1977. So why was Specter, fifteen years later, telling congress Warren *"may have been shown the photographs"* and acting as though this was inside information?

And where in the world did Specter get off blaming the commission's failure to view the photos on the Kennedys and their "wishes," when he knew full well that both Earl Warren and himself had viewed the back wound photo, and had known that the commission's exhibits were inaccurate, and had done nothing about it? What a piece of...work...

And I'm not the only one to have been troubled by his testimony. Approximately an hour after Sen. Specter's initial statements, Sen. John Glenn, the former astronaut, reading from a note presumably handed him by a member of his staff, confronted Specter regarding his blaming of the Kennedy family, and clarified for the record that the Kennedy family did not have possession of the autopsy photos and x-rays during the Warren Commission's investigation. This led Specter to back-pedal, at first claiming *"I did not say anything about the Kennedy family."* Of course, he had said something about the Kennedy family. Glenn failed to correct him on this, however, and asked Specter again whose decision it was not to inspect the autopsy photos and x-rays. Specter then admitted the truth. He testified *"I think the Kennedy family had a feeling on the subject. I can not testify to that from my own personal knowledge."* He then conceded: *"It was a Commission decision. The Kennedy family did not decide the issue. I believe the Commission did."* This concession, in turn, caught the attention of Sen. Levin, who sought further clarification, whereby Specter referred to his 4-30-64 and 5-12-64 memos to Rankin as proof he personally had tried to view the photos and x-rays. He then claimed *"I know I did not get to see them"* and *"I know that I did not have access to them."* Upon further prodding by Levin, moreover, he once again conceded that the commission's failure to view the autopsy photos and x-rays *"may well have"* come as a result of a decision reached by the commissioners.

He never once mentioned that he had, in fact, been shown the main photo he'd been seeking to see, the one establishing the location of the President's back wound, and that he had been shown this by the member of the Secret Service leading its investigation.

I repeat. What a piece of...work...

I mean, here was Specter testifying on this issue for a second time. And here, for a second time, he was failing to reveal that "Oh yeah, by the way, I did view a photo of the back wound which was subsequently determined to have proved the exhibits I'd placed into evidence inaccurate." Here he was, for a second time, failing to explain both why he'd failed to discuss his viewing this photo with his superiors on the commission, and why he'd proceeded to describe the back wound in the photo as a neck wound after doing so...

Apparently, his dodging yet another karma bullet emboldened Specter. The September 27, 1992 edition of Inquirer Magazine featured an extensive profile of Specter which briefly discussed his time working for the Warren Commission. While describing the single-bullet theory, he claimed the bullet *"entered*

between two large strap muscles." Yes, he once again claimed the bullet "entered" the back of Kennedy's neck between two muscles which Kennedy's "autopsy surgeon" made clear were at the front of Kennedy's throat. On May 30, 1995, Specter was interviewed on CBS radio by Tom Snyder, even worse, and once again revealed himself to be a serial spreader of nonsense. He told Snyder *"The bullet that hit the President in the back of the neck passed between two large strap muscles."* Yeah, sure it did. Shouldn't Snyder have told him that a tracing of the autopsy photo Specter looked at in 1964 was published by the government in 1979, and made 100% crystal clear that the wound was on the back, and NOT on the back of the neck, where Specter had long claimed it to have been? And shouldn't Snyder have thrown in that "And, oh yeah, the strap muscles were adjacent to the President's throat wound, and you should really stop pretending that the bruising of these muscles indicates the bullet creating the back wound traversed the body?"

But alas, no such luck. Specter's nonsense was not only swallowed by Snyder, but applauded.

And so the trail of lies continued. When Specter discussed his being shown the autopsy photo before the 1964 re-enactment in his 2000 memoir *Passion for Truth*, for example, he described it as "*a small picture of the back of a man's body, with a bullet hole in the base of the neck, just where the autopsy surgeons said Kennedy had been shot.*" Oh, my! Base of the neck? This once again steered clear of the fact that a tracing of this photo had been released by the government in 1979. This steered clear, moreover, of the incredibly inconvenient fact that this tracing PROVED the bullet hole to have been inches *below* the base of the neck. And what did he mean when he said "just where the autopsy surgeons said Kennedy had been shot?" Was he once again referring to the autopsy report, to hide that the exhibits *he'd* presented to the Warren Commission had been misleading?

In any event, Specter not only admitted in his memoirs that he failed to tell anyone on the commission he'd taken a look at the back wound photo, he tried to excuse his cowardice by adding "*an unauthenticated photo was no way to establish facts for the record.*" Well, this was the worst kind of nonsense. He'd admitted he was shown the photo by Thomas Kelley, the Secret Service inspector responsible for conducting its investigation of the assassination. He knew, moreover, that the Secret Service had possession of the photos. It would have been a simple matter then of his stopping by Bethesda for ten minutes and talking to Dr. Humes, to verify the wounds, and John Stringer, the photographer, to verify it was one of the photos he took on the night of the autopsy. He would then have had an authenticated photo.

That Specter's claiming the wound was at the base of the neck was not a one-time slip, whereby he accidentally repeated inaccurate information he'd grown used to telling, was made clear, for that matter, by his book's other references to the wound.

He first mentioned the wound in relation to his work for the commission.

- *"To nail down both the direction and the location of the bullet that struck the president's **back**, we wanted all possible indicators."* p.68

Notice how he calls it a back wound. He then discussed his meeting with the autopsy doctors in preparation for their testimony.

- *"At Bethesda, Ball and I tried to clear up some confusion over how far the bullet that struck Kennedy's **neck** had traveled through his body."* p.79
- *"they surmised that the bullet on the stretcher might have been pushed out the back of Kennedy's **neck** by the massage."* p.79
- *"As the autopsy progressed, the surgeons realized that the bullet had passed farther through the president's **neck**."* p.79

Now this last bit was just strange. The official story, of which Specter was presumably aware, was that the doctors didn't realize a bullet passed through Kennedy's neck until the morning after the autopsy, after Dr. Humes spoke to Dr. Perry and discovered that the tracheotomy incision had been cut through a bullet wound. So what does Specter cite as evidence for them learning of this the night before?

Read on and be amazed:

- *"They saw that the muscles in the **front of the neck** had been damaged at about the same time the wound was inflicted on the top of the chest cavity."*

Yes, truth is truly stranger than fiction. Here, in Specter's own book, was an accurate representation of Dr. Humes' testimony--that is, that the bruises on the strap muscles at the front of the neck had led him to suspect the neck wound pre-dated the tracheostomy. This, then, was as much as an admission he'd misled the public in his chapter in the Warren Report, and numerous interviews and articles, when he'd claimed the bullet slipped between these muscles upon entrance on the back of Kennedy's neck.

Or was it? Specter had a co-writer on his memoirs, Charles Robbins. Perhaps Robbins had caught Specter's mistake, and had added this bit into the book for the sake of accuracy.

This mystery only gets more curious, however, as we progress through Specter's book.

- *"When all the facts came in, it became clear that the **neck** shot had exited Kennedy's throat."*
p.80

Notice how what was formerly a back wound has now become a neck wound. Specter then discussed his being shown the back wound photo by Agent Kelley in 1964. As discussed, he presents this photo as:

- *"a small picture of the back of a man's body, with a bullet hole in the base of the **neck**, just where the autopsy surgeons said Kennedy had been shot."* p.88

He then describes a second viewing of the photo by him in 1999 in the company of Dr. Boswell.

- *"The entrance wound on the **neck** was about an inch below the shoulder line in the president's **back**. The exit wound at the site of the tracheotomy in his throat, was lower."* p.88

Well, how can a wound be "on the neck below...the shoulder line in the...back? Does that make any sense? Was he trying to have it both ways? And have the wound be on the back where everyone who's seen the back wound photo knows it to be? Whilst simultaneously being on the neck, where his single-bullet theory needs it to be?

Not surprisingly, Specter then insisted that he and Boswell had convinced themselves the President's back and neck wounds were "*consistent with the Single Bullet Conclusion.*" As if at this point we should take their word on anything...

Unfortunately, it seems the closest thing to an acknowledgment of error we'll ever get from Specter is his related acknowledgement that the Rydberg drawings were "*rough*" and that he would never have had them created if he knew that people would credit them "*with more precision than was intended.*"

Specter then discusses the Parkland witnesses, and repeats much of his nonsense.

- *"They never saw the bullet entrance wounds in the back of his head and the back of his **neck**."*
p.100
- *"The Parkland doctors saw the clean, round, quarter-inch hole in the front of the president's neck but didn't know about the wound in the back of his **neck**."* p.101
- *"Once the Parkland doctors were informed of the wound on the back of the president's head and **neck**..."* p.101

Specter then slips up again (at least presumably).

- *"...before the doctors there knew about the entrance wounds on Kennedy's **back** and head..." p.103*

The strangeness of Specter's book reaches a climax, however, when he discusses a conversation he had with Chief Justice Earl Warren, in which he convinced Warren of the soundness of the single-bullet theory. He claims he explained to Warren that:

- *"The autopsy showed that a bullet had struck Kennedy near the base of his **neck** on the right side and passed between two large strap muscles in his neck, striking only soft tissue as it continued in a slightly right-to-left, downward, and forward path..." p.109*
- *"The president's garment had holes and tears showing that a missile entered the back in the vicinity of his lower **neck**..." p.110*
- *"The wounds on the president and governor supported the Single-Bullet Conclusion. The first bullet would retain most of its high velocity after passing through the two large strap muscles in the back of the president's **neck**, slicing the pleural cavity, striking nothing solid, and then exiting from the front of his neck, nicking the left side of his tie." p.111*

Yes, you read that right. While on page 79 of his book Specter acknowledged that the bruised strap muscles described by Dr. Humes in his testimony were at the front of Kennedy's neck, 30 pages later he asserted that while selling the single-bullet theory to Warren he'd told him they'd been on the back of Kennedy's neck. He failed to explain that what he'd told Warren was inaccurate. Now, was this "gaffe" an accidental slip-up by Specter, and an indication that he'd long known or at least now knew that the strap muscles were on the throat, and not the back of the neck? Or was his presenting the same muscles in two different locations within one book the responsibility of his co-writer?

It's really hard to tell. Towards the end of his life, it became fairly clear that Specter's memory had faded.

When interviewed for a Fox News program in 2003, for example, Specter related that the early reports of the FBI and Secret Service said the first shot hit Kennedy on "*the back of the neck*," when, in fact, they said the first shot hit Kennedy "*below the shoulders*."

When discussing the assassination at the November, 2003 Wecht conference, for that matter, he claimed the driver of Kennedy's limousine was "James Greer" (as opposed to William Greer), and that Secret Service Agent Elmer Moore showed him an autopsy photo of Kennedy's back before the May, 1964 re-enactment. (In his book, published just three years earlier, he'd said it was Thomas Kelley who'd shown him this photo.)

But we can't let Specter off the hook for his most egregious statements, just because his memory might have slipped a little. Most of his questionable statements in 2003, in fact, were nothing new, and repetitions of the same old malarkey.

One could write a book, in fact, on the nonsense spewed by Specter at the 11-22-2003 Wecht Conference. He claimed, for example, that the wound on Kennedy's back was "*at the base of the neck*" and "*on the back of the President's neck*," and pointed to the back of his neck--inches above where Kennedy's wound was located--as he did so. He then repeated what he'd finally admitted in his book--that the Rydberg drawings were "*rough*" and "*inexact*" and that while he'd thought in 1964 that they were "*better than nothing*," he had since come to believe he'd been "*wrong about that*."

He then offered up more self-serving nonsense. He failed to admit that he'd used these "*rough*" and "*inexact*" drawings as evidence supporting his single-bullet theory, or even that the photo he'd been shown by "*Moore*" had proved to him they were "*inexact*," and, instead made out that he'd somehow

stood by his principles when he failed to tell the Commission the autopsy photo he'd been shown had proved the Rydberg drawings--what he had to have known would come to be considered the Commission's interpretation of Kennedy's wounds--were "inexact." Yep, Specter, standing before a large crowd of serious researchers, most of whom knew full well he was blowing smoke, claimed that when he was shown the photo by "Moore" before the reenactment he reacted not by using the wound location in the photo as the basis for the chalk mark on the JFK stand-in's jacket (as seems obvious from the photos of the reenactment), but by standing on principle. According to Specter, *"I told him I didn't want to see an unauthenticated photo. I wanted to see the Real McCoy."*

Well, my God! What horse-pucky!

In any event, Specter's statements at the Wecht conference cleared up one thing: he was still of the belief the strap muscles were on the back of Kennedy's neck, or at least in the business of pretending as much. Here is how he described his initial meeting with Dr. Humes: *"He said that the bullet had passed between the two large strap muscles, that it hit nothing solid as it went through the pleural cavity and sliced the President's trachea. When they conducted the autopsy, they did not know what had happened in the front until Dr. Humes called Dr. Perry--Malcolm Perry who had attended President Kennedy at Parkland. But, at any rate, the bullet according to Dr. Humes, passed between two large strap muscles (Here, he pointed to the back of his neck), as I say, but hit nothing solid..."*

In an interview broadcast on CNN's Newsnight program later that night, moreover, he repeated this nonsense: *"The bullet entered between two large strap muscles at the back of the president's neck, hit nothing solid, went through the pleural cavity, nicked his tie coming out."*

So there it is. While someone may have caught Specter's error regarding the strap muscles while working on his 2000 memoir, it apparently wasn't Specter, as by 2003 he had returned to form. This, then, suggests that it was Specter's co-writer Charles Robbins who'd corrected his error for his memoirs, and that Specter has in fact never wavered from his grossly inaccurate claim the strap muscles mentioned by Humes in his Warren Commission testimony were on the back of Kennedy's neck, and probed at autopsy.

Even after his departure from the Senate in 2011, moreover, he maintained the inexcusable. On February 21, 2011, an oral history interview of Specter conducted for PCN television was broadcast on C-Span. When discussing his first meeting with Humes, and the creation of the Rydberg drawings, Specter related *"He asked if it would be helpful to have some artist's drawings of where the bullet entered, in the head, the shots. And we said 'Yeah, that would be helpful.' Later they came to be a cause celebre. We never did see the x-rays and the photos while the committee was conducting its investigation. I saw them years later when I was Chairman of the Senate Intelligence Committee."*

Well, my, how convenient! His viewing the photo with Kelley had slipped his mind completely!

And that's not the worst of it. A few minutes later he once again discussed the make-believe strap muscles on the back of Kennedy's neck, and revealed that he'd not only learned little in the intervening years, but had actually grown ever more confused. When discussing his meeting with Dr. Humes on March 12, 1964, he claimed that Humes had told him *"he'd looked at the bullet hole on the back of the President's neck, and put his finger in the hole, and (discovered) that the bullet had hit nothing solid, (and) had passed between two strap muscles, and he didn't know what happened."*

It's shocking and sad, for that matter, how Specter, who'd once acknowledged that Humes had told him that the President's back muscles *"would resist any probing effort and would not disclose the path of the bullet to probing fingers,"* and who took Humes' testimony, in which Humes claimed he was *"unable...to take probes and have them satisfactorily fall through any definite path at this point,"* and who later admitted that the back wound could only be probed to *"a very slight extent,"* ultimately came

to claim that Humes' probing of the back wound revealed *"that the bullet had hit nothing solid, (and) had passed between two strap muscles."*

That this gross misrepresentation of the facts was quite possibly inadvertent was revealed, however, by some of the other whoppers told by Specter in the PCN interview. At one point, for example, Specter claimed that in their initial meeting Dr. Humes told him that 1) after the autopsy he'd *"speculated that the (bullet creating the) hole in the President's throat...might have come in from the front and struck a vertebra and glanced up and caused the tremendous damage to the top of the President's head"* and 2) that he'd abandoned this theory only after talking to Dr. Perry the next morning, and being told that the throat wound observed by Perry (which Perry had cut through while making a tracheotomy incision) was *"ragged,"* and appeared to be *"a wound of exit."*

Dr. Humes, of course, insisted to his dying day that he didn't know about the throat wound until he talked to Perry, and Perry, of course, insisted to his dying day that the throat wound appeared to be an entrance, whether or not it actually was an entrance.

Specter had clearly lost touch with what he had never fully grasped, and was all too willing to lie about.

Yes...to be clear, while it seems possible Specter was merely confused about the strap muscles, it seems almost certain that he LIED about the back wound location. The back wound photo Specter inspected shows a wound on the back, inches below the *"base of the back of the neck,"* where Specter long claimed it resided--even after viewing the photo. When taken in conjunction with Specter's previous behavior--his initial failure to tell the Warren Commission the back wound was not where it is shown in the Rydberg drawings, his taking testimony (which he knew to be untrue) suggesting the Rydberg drawings were used in the May 1964 re-enactment, and his deferring to the accuracy of the autopsy measurements when speaking to U.S. News (when the question related to the accuracy of the Rydberg drawings)--his being "mistaken" about something so obvious makes it abundantly clear that he lied, and lied repeatedly, in order to support the accuracy of the Rydberg drawings and convince the public the back wound was in a location consistent with his "Single-Bullet Conclusion."

Clothing Comparison

Left: Warren Commission Exhibit 386

Below: a crop from Figure 1 bringing the bullet hole in line with the bullet hole in CE 386.

The jacket is way too large. Thus, the bullet entrance in CE 386 is too far to the right.

Autopsy Face Sheet
Warren Commission
Exhibit 397

Right: HSCA Figure 1, Kennedy's suit jacket, with bullet hole visible between the shoulders.

HSCA Figure 24

In his testimony before the Warren Commission, Dr. James Humes said the bullet hole in the jacket at left "corresponds essentially" with the bullet entrance at the base of the neck in the drawing at center and above. Did he tell the truth?

Clothing Comparison

And it's not as if I'm the first to conclude Specter lied. No, sadly for Specter, I'm merely the latest in a long line of researchers to do so.

By June of '66, the critics of the Warren Commission had found their audience. The release of Edward Epstein's *Inquest* and the upcoming release of Mark Lane's *Rush to Judgment* received widespread attention in the mainstream press. Other critics, such as Harold Weisberg, received less attention. These early critics, moreover, invariably focused on the apparent migration of Kennedy's back wound, questioning how the hole in the middle of the back on the face sheet had become the hole at the base of the neck in the Rydberg drawings. Their suspicion the Rydberg drawings were in error was fueled, moreover, by their studying the photos of the President's shirt and jacket, which revealed holes in line with the lower entrance on the face sheet, not exactly the base of the neck.

Between the FBI reports at odds with the autopsy report and the face sheet and clothes at odds with the Rydberg drawings, to be clear, the critics had more than enough kindling to fuel their fire. And much of their fire was justifiably directed at Arlen Specter.

Specter was slow to come to this realization, however, and would for a time grant interviews to those with a sincere interest in his work on the commission. To explain how the holes in the clothes could be so much lower than the neck wound, for example, Specter told Gaeton Fonzi in their 1966 interviews that the shirt and jacket of the President had "*hunched*" up while the President was waving to the crowd. This plausible-sounding theory was first suggested by Dr. Humes in his testimony before the Warren Commission, after having viewed the President's clothes for the first time and asserting that the hole in

the clothing “*corresponds essentially*” with the location of the back wound in the Rydberg drawing. (According to Finck’s report to his Army superiors, Humes had refused Finck’s request to inspect the clothes during the autopsy.)

Still, Specter never tested Humes’ theory. He could have arranged for an exact copy of the President’s jacket, with the precise location of the bullet entrance marked, to be worn by a man of Kennedy’s exact stature during the FBI re-enactment of May 24, 1964, but apparently was not interested in establishing that this theory actually made sense. It was only appropriate then that, according to Fonzi, when Specter tried to demonstrate to him just how this hunching could occur, he made a fool of himself. Besides simply not working, this “hunching theory” failed to adequately explain how a well-tailored shirt and jacket could hunch up precisely in unison. It also failed to explain why the wound in the Rydberg drawing was not only several inches above the hole in the jacket, but to its right.

But that didn't stop other Warren Commission counsel from trying this same line of defense. In an 11-7-66 radio interview with KCBS radio's Harv Morgan, Warren Commission counsel Wesley Liebelier proclaimed *"When you take a shirt and pull it down on your body...and measure 5 1/2 inches below that bony tip behind your right ear--when I do it on myself the mark on the shirt comes 3 inches below the collar line. And then when you raise your shoulders up ever so slightly and hump the shirt up and raise your arms into the position the President was at the time, and measure it again, the mark on the shirt comes 5 1/2 inches below the collar line."*

And should one think Liebelier's pushing this argument was a one-time thing, he presented an even more confusing argument in an 11-27-66 L.A. Times article in which his opinions and those of fellow Warren Commission counsel Joseph Ball were pitted against those of Warren Commission critics Edward Epstein and Mark Lane. In this article, he claimed: *"I had my wife measure 14 centimeters from my right mastoid process down into my shirt and that spot came three inches below the collar...And then if you raise your arm to the position that the President was in at the time he was shot, the shirt very easily rides up and so does the coat and I did it myself and measured again and the second mark comes on my body 5 1/2 inches below the collar line which is exactly one quarter of an inch from the place where the hole was in the President's shirt."*

Well, beyond being confusing (he presumably meant to say "the second mark comes on my shirt"), this is most revealing. Liebelier acknowledged that a wound 14 cm below the mastoid process (the measurement of the back wound at autopsy) would be 3 inches below the collar line. Take a look at CE 386, the drawing of this wound's supposed location, on the slide above. There is no way Liebelier could possibly believe the wound in this drawing is 3 inches below the collar line. There is no way, for that matter, he could possibly believe 2 1/2 inches of fabric bunched up above this point on Kennedy's neck/back.

And he didn't. Yes, when questioned by Morgan on the 11-7-66 radio show about the inconsistent back wound locations presented on the face sheet and Rydberg drawings, and the fact that the holes on the President's clothing suggest that the face sheet location was accurate, Liebelier (and not only Liebelier, but fellow WC counsel Joseph Ball) insisted that the face sheet measurements were *"the most precise way"* to determine the location of the back wound, and that, when one did so, one found it was *"somewhat higher"* on the back than the mark on the face sheet. No defense of the Rydberg drawings was even attempted.

Of course, Liebelier didn't exactly denounce them, either. In fact, before admitting that the measurements indicated that the back wound was only *"somewhat higher"* than the mark on the face sheet, he blew a puff of smoke in the direction of Morgan's listeners, telling them the wound was *"right at the base of the neck."* This, then, supported the myth he'd proclaimed earlier in the interview, that, when one used the wound and clothing measurements to determine the back wound location, one found

that the president's back wound was *"higher on the back than it was on the front"* and that the bullet traveled at a *"downward angle."* Call me irresponsible, but it seems mighty suspicious that Liebeler would proclaim such nonsense and make a point of claiming the face sheet was inaccurate, but then fail to acknowledge the 800 pound gorilla in the room--that the Rydberg drawings were even less accurate.

As a result, it seems clear that Liebeler and Ball, as Warren and Specter before them, knew full well that the Rydberg drawings were inaccurate and deceptive, but opted to not only not tell the public of this deception, but to play along and promote this deception.

Unscrambling History

Now I know what you're thinking, because I've had these thoughts myself. You're thinking that the list of people lying to support the accuracy of the Rydberg drawings has grown a bit unwieldy. And you're right. It's important to note, however, that Warren, Specter, and Kelley were the only ones to have seen the autopsy photo of Kennedy's back, and to have known for an absolute fact that the wound was on Kennedy's back, not neck.

It seems possible, then, that the others didn't know for certain they were lying, and were just repeating the nonsense Specter had fed them, and supporting the commission as a whole.

Or not.

When one fully immerses oneself in the Kennedy assassination medical evidence, one finds that it is indeed quite possible that many saw the photo of Kennedy's back, and knew, for a fact, the Rydberg drawings were deceptive, but opted to conceal this from the public.

The ARRB interview of Dr. Paul Peters, one of the doctors who'd worked on Kennedy in Dallas, yielded the surprising anecdote that he was friends with FBI Director J. Edgar Hoover's urologist, Dr. John Lattimer, and that Lattimer had told him a surprising story--that Hoover had given him access to a set of the president's autopsy photos--Hoover's own private set, mind you--just to spite Robert Kennedy.

If Peters' story is accurate, and Lattimer's story was true--well, geez--that's truly awful. The man who'd led the FBI's investigation into the physical aspects of the assassination, Al Rosen, we should remember, refused to look at the autopsy photos or even read the autopsy report. The man who'd conducted Kennedy's autopsy and who'd supervised the creation of the official drawings of Kennedy's wounds, Dr. James J. Humes, even worse, was denied the opportunity to review the autopsy photos or compare them to the drawings. And yet J. Edgar Hoover's urologist, Dr. Lattimer, could study them to his heart's content! Sickening.

(It should be pointed out, however, that in 1972 Dr. Lattimer became the first independent doctor to inspect the autopsy materials. It seems possible, then, that Dr. Peters took this actual event--of the urologist Lattimer's being the first to view the materials--and scrambled it up into the story he told the ARRB.)

Making Peters' story more believable, however, is Earl Warren's posthumously-published recollection that he saw the photos when they came over from Bethesda Naval Hospital. As the official reports and testimony of Robert Bouck, head of the Protective Research Division of the Secret Service, indicate that from the night of the autopsy until mid-1965 the autopsy photos remained in the sole custody of the Secret Service, and were never returned to Bethesda Naval Hospital--and that the Chief Justice never even paid them a visit to view the materials--this can be taken as an indication that the Navy had its own set of photos.

(It should be pointed out, however, that Warren was in his eighties when he wrote his memoirs, and may simply have forgotten a private visit with Secret Service Chief Rowley, or something equally innocent.)

The effects of old age might also explain the June, 15, 1975, statements of Warren Commission counsel Joseph Ball. Ball told the Long Beach, California, Press-Telegram that *"he was the first one to contact the autopsy surgeon at Bethesda Naval Hospital,"* and that *"We went out and spent the afternoon with him...he gave us a complete description of the wounds on Kennedy's body—he even drew pictures of it...He showed us a complete set of x-rays and color pictures which were turned over to Bobby Kennedy at his request and the request of the Kennedy family. The color pictures definitely show there was an entrance wound on the rear, right side of his head that blew the top of Kennedy's head off."* As Ball also insisted that the release of these pictures would end all speculation on the direction of the shots, and since he only mentioned the *"color pictures"* and stated elsewhere that *"These pictures show, as every doctor has testified, that the wounds of entry were in the back of the head...he was shot in the back of the neck and the rear of the head"* it seems likely the *"pictures"* he was thinking of were the Rydberg drawings, which were in color and depicted the wounds as described.

But the Rydberg drawings were never turned over to Robert Kennedy. And one can only wonder how Ball could think the release of a drawing long available would end all speculation on the direction of the shots. So perhaps Ball was also just confused. Ball was 73 at the time of this article.

Supporting that Ball's memory was slipping in 1975 (and that he'd confused the Rydberg drawings for the autopsy photos) is a 1-5-67 Van Nuys Valley News article on a press conference by Ball in which he *"admitted he has never seen"* the autopsy photos and x-rays, but nevertheless called for the public release of the photos and x-rays to *"competent pathologists"* in order *"to show the world Cmdr. James J. Humes and the other doctors testified properly and accurately."*

There is, however, some, but not much, support for Ball's latter-day claim he'd seen the photos. A June 1967 series of articles on the Warren Commission by Associated Press writers Bernard Gavzer and Sid Moody reported: *"Albert Jenner, an assistant counsel now in Chicago, says he saw some of the autopsy photographs..."* Hmm... 1967 was of course only three years after the Warren Commission and Jenner was then but 60 years old. It's doubtful, then, that his memory could have faded so rapidly about such an issue of such importance. The possibility exists, therefore, that the autopsy photos supposedly denied the autopsy doctors prior to their Warren Commission testimony and still officially hidden from the public were never denied to anyone, and were secretly circulated among the autopsy doctors, the Warren Commission, and the Warren Commission staff, as well as various Washington insiders, throughout 1964.

A September 18, 2010 post by single-assassin theorist John Fiorentino on the alt.assassination.jfk newsgroup further supports this possibility. While disputing something I'd written, Fiorentino boasted that he'd received a clear copy of the back wound photo from Warren Commission counsel David Belin. As Belin had also worked with the Rockefeller Commission pathology panel, which had indisputably viewed the photos, however, it seems probable Belin had kept one of the Rockefeller Commission's copies as a "souvenir."

The likelihood remains, then, that Jenner lied to the Associated Press for their 1967 article. Researcher Sylvia Meagher claimed to have sat behind Jenner's daughter at a February 1967 televised discussion of the assassination, and to have overheard Jenner's conversations with his daughter. After Mark Lane quoted Jenner from a 12-23-66 radio broadcast, where Jenner claimed *"Some members of the Commission saw both the film and the colored pictures, and the X-rays. We of the staff saw them ourselves,"* and Jenner refused to comment, Meagher heard Jenner's daughter ask her father if he'd in fact seen the photos, and witnessed Jenner shake his head "no." In December, 1966, of course, the

Commission and its former counsel were dedicated to cutting off the then-widespread demands for a new investigation, and Jenner's lies may have been designed to help their cause.

There is reason to believe, moreover, that their efforts were part of a much larger plan.

Boswell's Anatomy

Autopsy Face Sheet marked by Dr. Boswell, November 22, 1963

Here, the mark signifying the back wound location is equidistant between the two landmarks used in the autopsy report.

Autopsy Face Sheet with X depicting a new actual location of the back wound, marked by Dr. Boswell for The Baltimore Sun, November 25, 1966

Here, the X is 87 percent further from the shoulder tip than from the right mastoid process.

Autopsy Face Sheet with mark and arrow depicting an even newer actual location of the back wound, marked by Dr. Boswell for the HSCA, August 16, 1977

Here, Boswell's mark is 360 percent further from the shoulder tip than from the right mastoid Process.

Since the measurements taken at the autopsy reflect that the back wound was the same distance from the bottom right tip of Kennedy's skull and his shoulder tip, we are able to assess the accuracy of the three face sheet drawings created and approved by Dr. Boswell. He had it right the first time.

Boswell's Anatomy

We've already asserted that the placement of the back wound on the face sheet was reasonably accurate. We'll now prove it beyond all doubt. The measurements recorded at autopsy placed the back wound equidistant between two landmarks, 14 cm below the right mastoid process of Kennedy's skull, and 14 cm from acromion, the tip of his right shoulder. As demonstrated above, the mark on the face sheet is--well, I'll be darned--equidistant between these two landmarks.

That's it. That's all there is to it. This isn't rocket science.

In November, 1966, however, after critics of the Warren Commission had pointed out that he'd marked the back wound on the face sheet below the level of the throat wound, Dr. Boswell reportedly re-marked a copy of the face sheet for the Baltimore Sun, and placed the back wound at a location well

above the throat wound. He explained this at the time, moreover, by stating *"If I had known at the time that this sketch would become public record, I would have been more careful."*

And yet, as careful as he claimed to be in 1966, in 1977, after having been contacted by the HSCA and asked to mark a third face sheet, he depicted the back wound even higher on the body, squarely on the President's neck.

From these actions one might wonder if Boswell was remembering things *backwards*, that is, if he was taking what he believed to be important or was told was important, e.g. that the bullet entrance was high enough on the President's body for a bullet heading on a downward trajectory to enter the President's back and exit his throat, and then marking this position on the sheet. Perhaps the suggestion he'd been part of a conspiracy had taken its toll on Dr. Boswell and had led his memories of the wound to blur into accordance with the official government impression of the wounds. Perhaps this "blurring" was in full effect even before Boswell re-inspected the autopsy photos on November 1, and was to such an extent that neither he nor Dr. Humes realized the back wound in the photos they were studying was at or below the level of the throat wound, and most certainly not above. The research and writings of Dr. Elizabeth Loftus tell us, after all, that when one is led to imagine a plausible event, e.g. the single bullet theory, one's memories can become entangled with that imagined event. Perhaps then Boswell's face sheets are simply textbook cases of memory distortion arising from imagining a plausible event.

Dr. Boswell's 1996 ARRB testimony in fact supports that he worked backwards. Even though he'd been shown the official back wound photos three times, most recently in 1977, Boswell corrected his questioner Jeremy Gunn by telling him that the wound was not a thoracic wound (as stated in the autopsy report signed by Boswell in 1963) but on the neck. He stated further that the wound would not be nearest a thoracic vertebrae, but a cervical vertebra. While looking at the back wound marked on the face sheet, moreover, he tried to explain his reasoning: *"where I had drawn this was—if you looked at the back of the coat it was in the exact same place...but the coat had been...he was waving, and this was all scrunched up like this. And the bullet went through the coat way below where this would be on the body, because it was really at the base of his neck. And the way I know this best is my memory of the fact that...when we opened up the chest...the bullet had not pierced through into the lung cavity... And so...The wound came through and downward and out about the thyroid cartilage. So if you put a probe in this and got it back through like this, that would come out right at the base of the neck."* Minutes later, when shown the autopsy photo of Kennedy's back, however, Boswell recognized his error and acknowledged that the wound in the photo was in fact not on the neck but **on the back**, and was nearest, by his estimate, the second thoracic vertebrae.

Were Dr. Boswell a simple liar he would most probably have argued that the wound was actually nearest a cervical vertebrae, but that the angle of the photograph had distorted the wound's actual position, etc...

That Dr. Boswell was remembering things backwards in '96, however, does not preclude that he was pressured into changing his statements in '66. He was, after all, under a military order of silence in 1966. Before speaking to the Baltimore Sun and other papers, he would almost certainly have to have received approval from the Justice Department.

Now, ask yourself, was this approval likely to be granted should Boswell not agree to, well...agree?

The Boswell Incident

A little back-story (pun intended) is in order at this time...

By June of '66, people were talking not only about the books of Epstein and Lane, but articles critical

of the Commission appearing in various magazines and newspapers. One of these, an article by Fred Cook in *The Nation*, revealed that the Warren Commission had not only failed to study the photographs and x-rays of President Kennedy's body in order to verify the accuracy of the Rydberg drawings depicting Kennedy's wounds, but had, even worse, prevented the doctors who'd created these drawings from studying these materials, and using them for reference.

This was powerful stuff. The impact of this information was such that Jacob Cohen, in a counter-point to Cook's article in *The Nation*, nevertheless agreed that *"the x-rays and photos must now be made available for competent study and interpretation."*

The net effect of these articles, even defenses of the Commission like Cohen's, then, was to raise doubts about the Commission's conclusions.

This, in turn, raised doubts about the legitimacy of Lyndon Johnson's presidency. As a consequence, it became politically desirable for the Johnson Administration to have the autopsy doctors do what they should have done in 1964--verify the accuracy of the drawings they'd presented the Warren Commission.

But there was a problem: the autopsy materials had been given to the Kennedy family the year before. Negotiations thereby commenced for their return.

Before this was done, however, Robert Kennedy had a talk with family friend, historian Arthur Schlesinger. According to Schlesinger's posthumously published journal, *Journals 1952-2000*, he spent the evening of October 30, 1966 discussing William Manchester's upcoming book on the assassination with Kennedy, and *"this led on to a discussion of the autopsy photographs and then of the Warren Report. RFK wondered how long he could continue to avoid comment on the report. It is evident that he believes it was a poor job and will not endorse it, but that he is unwilling to criticize it and thereby reopen the whole tragic business."*

The next day, October 31, 1966, the Kennedy family transferred control of the photographs and x-rays back to the National Archives and announced that, in but five years, in what those loyal to President Johnson undoubtedly hoped would be his second elected term as President, these photographs and x-rays would be subject to review...by independent experts, beyond Johnson's control.

Wasting no time, on November 1, 1966, the Johnson Administration arranged for autopsy pathologists Dr.s Boswell and Humes, autopsy radiologist John Ebersole, and autopsy photographer John Stringer to finally review the autopsy photographs and x-rays they'd taken on 11-22-63. They created an inventory list for these items. Under the guidance of Johnson's Justice Department, they signed this list on November 10. Suspiciously, the final version of this list included a statement that these photographs and x-rays represented all the photographs and x-rays taken at the autopsy, a statement all four men would later swear was untrue. More important for our immediate discussion, however, is that the inventory list signed by the doctors describes photo 11 as showing *"a wound of entrance of missile high in shoulder"* and color transparency 38 as showing a *"missile wound high in right superior, posterior shoulder."*

On 11-4-66, at a press conference, President Johnson was asked why the autopsy photos and x-rays had not been made available to the public. He responded:

"I think it has been available to the Warren Commission any time it wanted to see it. Second, I think it is available to any official body now. Third, I think that every American can understand the reasons why we wouldn't want to have the garments, and the records, and everything paraded out in every sewing circle in the country to be exploited and used without serving any good or official purpose. It is my understanding--all of this took place while I was away--that most of this has been over in the

Archives stored all the -time. It has always been available to the Warren Commission and the Government, the Justice Department, the FBI. The late, beloved President's brother was Attorney General during the period the Warren Commission was studying this thing and I certainly would think he would have a very thorough interest in seeing that the truth was made evident. I believe he did have. I think that he, the FBI, and the entire Government made available everything that the Commission wanted. I think they made a very thorough study. I know of no evidence that would in any way cause any reasonable person to have a doubt about the Warren Commission. But if there is any evidence and it is brought forth, I am sure that the Commission and the appropriate authorities will take action that may be justified."

President Johnson had of course misrepresented RFK's role in the assassination investigation, which had been next to non-existent. He had also failed to appreciate that the Commission no longer existed. He was apparently unaware, moreover, that his long-time friend and former campaign manager, Texas Governor John Connally, had just been interviewed by Life Magazine, and would magnify the cries for a new investigation by asserting that he had serious doubts about the single-bullet theory, the cornerstone upon which the commission's case for a single-assassin had been built. (Johnson shared these doubts, but had never admitted as much to the public.)

Perhaps, then, Johnson thought he had things under control. The 11-14-66 issue of U.S. News and World Report, in anticipation of William Manchester's book, recounted in detail the day of the assassination. It took Johnson's side on a number of issues. It included as well a brief article on Humes' and Boswell's 11-1-66 review of the autopsy photos and x-rays. This article showed Dr. Humes to be quite careful: *"Afterward, Commander Humes said 'the pictures showed just what we testified to' before the Warren Commission—that the assassin's bullets were fired from 'above and behind,' and that the fatal shot caused a 'massive' head wound."* But the article showed Dr. Boswell in a different light. It claimed: *"Commander Boswell said the pictures prove that 'the drawing we submitted' to the Commission 'was identical with the photographs.'"*

Yes, he said *"identical."* If the Administration was looking for someone to issue a license to lie, they had their man.

They most certainly had cause for concern. Johnson's Daily Diary, available on the Johnson Library website, reflects that on 11-19-63 Johnson spent the bulk of a 2 hour flight *"reading a proof"* of William Manchester's book on the assassination, *The Death of a President*. Manchester's book was authorized by the Kennedy family. The early drafts of the book were purported to have been extremely hard on Johnson--not painting him as a conspirator to kill Kennedy, but as one unable to conceal his delight in his own rise to prominence. Reading this book, particularly at this point in its development, would no doubt contribute to Johnson's already stated belief that Robert Kennedy was out to get him, and willing to use the assassination to do it.

On November 21, 1966, and over the next few days, an AP article is published nationwide, in which long-time Kennedy family friend, historian Arthur Schlesinger, is quoted as having told an audience that *"substantial facts and doubts do exist which would warrant a very intensive inquiry."* In the eyes of Johnson, this could only be a message from Robert Kennedy. In this same article, moreover, one-time Johnson mentor and member of the Warren Commission, Senator Richard Russell, let it be known that he'd objected to the Commission's conclusion there had been no conspiracy, and only agreed to go along with the suggestion there hadn't been one because Chief Justice Warren wouldn't allow him to publish a dissent.

Between the Life article, the upcoming Manchester book, and this AP article, then, the Johnson Administration must have felt under siege.

They decided to fight back. Some time in this period (my efforts to establish the exact date continue)

Johnson's former aide Jack Valenti writes a memo to Johnson describing disbelief of the Warren Commission's findings in Europe. According to James Reston Jr.'s book on Governor Connally, *The Lone Star*, Valenti notes, furthermore, that *"This is not a lightly or rarely held view. It is widening among the peoples of Western Europe. It could become so malignant as to threaten seriously the very integrity of the American Government."* Valenti then proposed the formation of a panel of prominent lawyers, led by Louis Nizer, an outspoken supporter of the Warren Commission's findings. Valenti then concluded *"Nizer and others ought to be unleashed immediately to publish a counter defense that would nail the detractors and the irresponsible nuts against the wall. The key to the whole assault on the Commission is the so-called single-bullet theory. If this panel of distinguished lawyers could demolish the attack on the single-bullet theory, the slanderers would be laid to rest."*

And Valenti wasn't the only one proposing the Administration do something to silence the critics of the single-bullet theory.

On November 21, former Warren Commission counsel W. David Slawson (now working for President Johnson in the Office of Legal Counsel) writes a memo to Acting Attorney General Ramsey Clark regarding a telephone conversation he'd just had with former Warren Commission counsel J. Wesley Liebler. According to Slawson's memo on this phone call (which can be found in the Harold Weisberg Archives) Liebler claimed that he'd spoken to Harrison Salisbury of the New York Times the week before, and that Salisbury *"was planning a series of articles on the criticisms of the Warren Report,"* and *"believed the criticisms were serious enough to warrant a re-opening of the investigation."* Even so, Liebler felt:

"There is still a reasonable chance of spiking this thing by a re-investigation limited to aspects of the autopsy, but if public opinion continues to develop like it has over the past few months we may soon be faced with a politically unstoppable demand for a free-wheeling investigation of all aspects."

The political importance of this "limited" re-investigation was paramount, moreover, because, according to Liebler: *"The lunatic fringe already allege or broadly hint (involvement of) the highest echelons of Government in the assassination, and the Government's participation in the 'hiding' of the photographs and X-rays dangerously lends creditability (sic) to their hints and allegations."*

According to Slawson, Liebler then went on to relate that he (Liebler) had tried to convince Richard Billings of Life Magazine to hold off on its current article on Connally, as it had *"a responsibility not to publish"* an article on Connally without asking *"questions designed to elicit the other side of the issues on which he disagreed with the commission."* According to Slawson, Liebler then proceeded to discuss how at least one of the critics could be turned against the others, noting that Edward Epstein, the author of *Inquest*, *"now feels satisfied on all issues raised in his book except those connected with the autopsy X-rays and photographs. He still believes that they should be examined by an independent group of pathologists. If they are so examined, and if the group contains a man acceptable to him, and if the result is to confirm the Commission's findings, Epstein will publicly state his satisfaction with the report--in effect, he will publicly repudiate the doubts and suspicions he himself cast in his book. And he will join with Liebler and others in defending the report against Lane, who Epstein is now convinced is unscrupulous and dangerous."*

This memo, then, suggests that the Acting Attorney General, President Johnson's legal advisers, and former Warren Commission counsel were all conspiring to prevent a new investigation.

What happened next is uncertain, but it appears that Johnson himself took the next step, and asked Governor Connally for his help. President Johnson's Daily Diary for 11-22-66 reflects that he talked to Governor Connally in the morning, and spent the entire evening with him at his presidential ranch in Texas. On 11-23, the very next day, Governor Connally, whose recent interview with Life Magazine helped fuel the crisis, called a press conference in which he read a prepared statement, reiterating his

doubts about the single-bullet theory but nevertheless joining hands with the Johnson Administration by attacking the critics of the Warren Commission. A transcript of the statement published in the next day's New York Times reflects that he began by re-asserting his recollection of the shooting, in which the President and he were hit by separate bullets, but then added *"I want to make It very clear, however, that simply because I disagree with the Warren Commission on this one detail does not mean that I disagree with the substance of their over-all findings."* He then listed the members of the commission one by one, and described them as *"men of unquestioned integrity of long and devoted service to their nation; men whose dedication to the tasks of seeking truth in these circumstances I would never question, and men whose patriotism has been manifested so many times in so many ways over such a long period that it now is somewhat shocking to me that in the backlash of tragedy, journalistic scavengers such as Mark Lane attempt to impugn the motives of these members individually, cast doubts upon the commission as a whole, and question the credibility of the government itself."* He then pushed that rather than start a new investigation of *"unfounded conspiracy theories"* that is *"neither warranted, justified, or desirable,"* *"we (and by "we" he clearly meant members of the media, such as those working for Life Magazine and the New York Times, who'd proposed such an investigation) should turn our attention to doing a little research on and evaluation of the credentials of these self-appointed experts, who, with no new evidence, no new facts, nevertheless use distortion, inference, innuendo, in order to cast doubts and create confusion."* He then offered *"I suspect that a searching investigation into their own credentials will divulge that their motives have political overtones and that their views have been given prominence out of proportion to their value."*

One can only speculate as to the actual author of Connally's statement. The President's diary for 11-23-66, however, reflects that at 3:34 PM he once again talked to Connally. One might venture this was a discussion of the press conference, and perhaps an expression of gratitude.

But that wasn't enough for some close to Johnson. As discussed in a November 16, 1988 article by Seth Kantor (found in the Henderson N.C. Times-News) an 11-23-66 memo to Johnson from John Roche, one of his "special consultants", took note of both Governor Connally's recent statements and those of former Warren Commissioner Richard Russell (who'd admitted, in an interview with the Atlanta Journal, reported nationwide by UPI on this very day, that he agreed with Connally in rejecting the single-bullet theory), and asserted: *"The comments of Richard Russell and the Life Magazine article by Governor Connally are the two most serious blows which have yet occurred to the public credibility of the Warren Commission. Russell, in particular, by undermining the unanimity of the commission, has turned the cat loose among the canaries. Now the newspapermen are beginning the process of interviewing everyone listed in Who's Who on his view of the Warren Commission... Paranoia, regrettably, is more infectious than measles. We have enough problems already with the war in Vietnam, and to have the nation suddenly indulging in an orgy of sick speculation on events in Dallas could really poison the atmosphere."* Roche then suggested that Johnson give *"top priority to the problem, perhaps convening a group of your wisest counselors to work out a strategy."* He then urged Johnson to instruct his aides to make no comment on the issue, a suggestion with which Johnson complied by dictating a memo to Robert Kintner, telling him to *"instruct everybody accordingly."*

Johnson, or *"one of his wisest counselors"* then, arranged for others to do their dirty work, and publicly support the single-bullet theory deemed necessary for the single-assassin conclusion. While it's just speculation that someone from the White House made some calls to bring about the news stories of the next few days, this speculation is more than reasonable given the circumstances. Consider...

An October 6, 1966 phone call between President Johnson and his most trusted adviser Supreme Court Justice Abe Fortas has Johnson instruct Fortas to have a talk with FBI Assistant Director Cartha "Deke" DeLoach, whom Fortas claims is a *"very close friend"* to Johnson, and enlist him in their campaign to prop up the Warren Commission's conclusions.

An internal FBI memo dated 11-22-66 (Rosen to DeLoach, 11/22/1966, FBI HQ JFK Assassination File, 62-109060-4267), however, shows that this help was not readily available, for on this memo FBI Director J. Edgar Hoover notes *"We don't agree with the Commission as it says one shot missed entirely & we contend all three shots hit."*

But then something happened. On 11-25-66, Hoover issues a statement claiming *"There is no conflict"* between the FBI's position and that of the commission, as *"The autopsy report said the bullet did exit from the front of the President's neck. Thus, it could have passed through Connally, who was seated in a jump seat directly in front of the president."* He then explains the confusion, attributing it to the fact that the FBI agents at the autopsy had been told no exit wound could be associated with the entrance wound on the back, but that, unknown to these agents, *"the physicians eventually were able to trace the path of the bullet through the body."* (This, of course, never happened.)

So...someone--perhaps Johnson, perhaps DeLoach--got to Hoover, and got him to publicly support the single-bullet theory.

DeLoach himself suggests his involvement. An 11-25-66 memo from DeLoach to Tolson recounts that DeLoach had called Chief Justice Earl Warren on 11-23-66 on an apparently unrelated matter, but that Warren had brought up some of the recent problems surrounding the commission during the phone call. According to DeLoach, Warren complained about former commission counsel Wesley Liebeler, and noted that Liebeler was a *"'beatnik' type of individual who had proved to be very unethical."* According to DeLoach, Warren was displeased that Liebeler had kept detailed notes on his disagreements with the commission, and that Liebeler's notes had formed the *"basis"* of Epstein's book. In closing, however, DeLoach revealed more about himself than about Warren and his obvious dislike of Liebeler. He wrote: *"I informed the Chief Justice... that the Director, in the near future, planned to issue a statement defending the FBI's phase of the assassination investigation. The Chief Justice said he was glad to hear this and that the Director's name and prestige would be a great help in clearing the air."*

Well, let's think about this. DeLoach has told Warren on the 23rd--the day after Hoover claimed the FBI did not agree with the commission--that Hoover was about to issue a statement defending the FBI's phase of the assassination investigation. And Warren was pleased with this and felt this statement would help "clear the air." Well, seeing as a statement from Hoover defending the FBI in which he voiced his disagreement with the single-bullet theory would not be good news to Warren, it seems fairly obvious DeLoach knew Hoover was about to offer his support for the single-bullet theory, and has told Warren as much...two days before Hoover did so.

Now consider that a 12-5-66 column by Drew Pearson, Washington D.C.'s most influential muckraker, was devoted to the proposition that much of the secrecy surrounding President Kennedy's autopsy was the fault not of the Johnson Administration, but the Kennedy family, which sought to hide President Kennedy's Addison's disease from the public. This column, built around an article in a German publication, repeated and proposed a number of cruel lies, including *"that the Kennedys hid the X rays, even from the Warren Commission,"* because the *"X rays could have revealed the Addison's disease."* Pearson, it should be noted, often worked as a hatchet-man for Johnson. In an oral history for the Johnson Library he admitted that he was scheduled to meet with Johnson at Johnson's ranch on the night of the assassination. About what it is not clear. But it seems more than a coincidence that, within days of the assassination, Pearson published a blistering attack on Don Reynolds, the insurance salesman who'd testified before congress on 11-22 regarding Johnson's corrupt business practices.

And this was no isolated incident. On March 3, 1967, the day after Robert Kennedy publicly declared his opposition to Johnson's continuing escalation of the war in Vietnam, Pearson and his colleague Jack Anderson published a column regarding a story he'd known about for months, and had personally discussed with Johnson. Its opening line read: *"President Johnson is sitting on a political H-bomb, an*

unconfirmed report that Senator Robert Kennedy may have approved an assassination plot which then possibly backfired against his late brother." Yep, you got it. In December 1966, just after Life Magazine, the New York Times, and Kennedy family friend Arthur Schlesinger called for a new investigation of the Kennedy assassination, Pearson published a column blaming the Kennedy family for the secrecy regarding President Kennedy's autopsy, and then, in March 1967, just after Robert Kennedy started criticizing Johnson's policy regarding Vietnam, Pearson published a column blaming Robert Kennedy for his brother's murder.

It seems clear, for that matter, that Johnson was behind Pearson's attacks. October 3, 1966, October 6, 1966, and January 11, 1967 taped telephone conversations between Johnson and his Supreme Court appointee and confidante Abe Fortas help us understand what Johnson's friend Connally meant when he said he suspected there were *"political overtones"* behind the books and articles criticizing the Warren Commission. These calls make clear, moreover, that Johnson himself was a conspiracy theorist of the highest order, and that he suspected Robert Kennedy (big surprise)--along with pollster Lou Harris, The Washington Post, Newsweek, Look Magazine, and forty one employees of The Kennedy Foundation--of conspiring against him at every turn. He proposed that Kennedy was somehow behind: 1) an attempt to tie Johnson to the crimes of convicted felon Billie Sol Estes in 1962; 2) the public exposure of corruption and the subsequent loss of power of Johnson crony Bobby Baker in 1963; 3) the public disgrace and resignation of Johnson aide Walter Jenkins in 1964; 4) the current attacks on the Warren Commission; 5) the concurrent creation of "great doubt" about whether he, Johnson, "really killed the President;" 6) the forthcoming resignation of Johnson aide Bill Moyers; 7) the forthcoming release of William Manchester's *The Death of a President* in 1967, while Johnson was still in office, and 8) the recent exposure of corruption and the subsequent loss of power of both Democratic Congressman Adam Clayton Powell of New York and Democratic Senator Thomas Dodd of Connecticut. Apparently, Johnson felt "Bobby" was out to get him from even before the assassination, and was trying to undermine the legitimacy of his presidency, so that he ("Bobby") could retake the presidency in his brother's name.

When one takes Johnson's paranoia about RFK into account, of course, it only makes sense that he would strike back in every way possible...including spinning public opinion against a new investigation via the planting of stories either critical of the Kennedy family (the Pearson columns) or supportive of the Warren Commission and single-bullet theory (the Hoover statement).

So now let's consider that on 11-24-66, a brief spell after Jack Valenti's memo urging that the single-bullet theory be defended, three days after David Slawson's memo urging that a re-investigation of the medical evidence be used to cut off a new investigation, the day after John Roche's memo stressing the importance of such an action, and the very day of a 10-15 minute phone call between President Johnson and Abe Fortas, the recording of which was destroyed under order of President Johnson (the only recording to be so destroyed), an AP article emerged, in which Dr. J. Thornton Boswell took personal responsibility for much of the confusion over the President's wounds.

This article, by Jack Miller, claimed:

"A doctor who helped perform the autopsy on President John F. Kennedy said today he made a diagram error in a hasty 'worksheet' sketch which was not drawn for the final autopsy report. Some critics have used the sketch in challenging the Warren Commission Report.

Dr. J. Thornton Boswell said the diagram showed that the lower bullet wound was in the President's back. Actually, he said, the wound was at the back of the base of the neck.

The position of the wound was crucial in determining the trajectory of the bullet.

Boswell said the diagram was drawn quickly during the autopsy as 'rough notes' and was not meant to

be exact. He pointed out that longhand notes he made on the sketch gave the correct, precise location of the wound...

In an interview, Boswell said that when he examined the autopsy photographs for the first time Nov. 1, the pictures showed clearly that the wound was in the neck. The photographs are in the National Archives and are not available to the public...

One of the critics of the Warren Report, Edward Epstein, used the diagram and the FBI reports to suggest the possibility that there may have been a second assassin.

But Epstein, author of the book "Inquest," conceded in the current issue of Esquire magazine that if the autopsy photos showed the wound in the neck, there would be no further doubt about the autopsy report and that second assassin would be ruled out."

And should one think the timing of this article a coincidence, one should also consider that an 11-25-66 article by Peter Kihss for the New York Times quoted Boswell as asserting that, after he and Dr. Humes inspected the photos on November 1, 1966, there was "*absolutely no doubt in our minds now*" about the single-bullet theory, and then repeated the lie that measurements were used to create the Rydberg drawings. To be precise, the article related that:

"The Warren Commission published "schematic drawings" done by a Navy medical illustrator and based on measurements and verbal descriptions given him by the autopsy surgeons just before they were called to testify. The drawings include Commission Exhibit 385, which shows the downward path the bullet is thought to have taken through the President's neck, and they remain 'sufficient to illustrate the finding' Dr. Boswell said yesterday."

And, should one still have doubts that Dr. Boswell's interviews were being orchestrated by hands unseen, one should finally consider that in the extensive 11-25-66 article in the Baltimore Sun, in which a new and improved version of the face sheet was unveiled, Dr. Boswell was purported to have also claimed that:

- *the photographs and X-rays prove conclusively that the facts about the wounds as printed in the Warren Commission Report were consistent with the findings of the autopsy...*
- *there was absolutely no doubt that the controversial neck and throat wound was caused by a bullet that entered the base of President Kennedy's neck, passed completely through the neck, and exited from the throat...*
- *The wound in the back of the neck, was without any doubt, one of entrance and not of exit...*
- *A report made by FBI observers present at the autopsy inaccurately referred to a 'back' wound rather than a neck wound and should be discounted...*
- *the autopsy was routine in every respect and...included every activity which would accompany a medical-legal autopsy...*
- *(At the commencement of the autopsy) The pathologists had already been told of the probable extent of the injuries and what had been done by physicians in Dallas...*
- *the tracheotomy incision was examined and extensive trauma was noted on one side...*
- *(The pathologists) "concluded that night that the bullet had, in fact, entered in the back of the neck, traversed the neck, and exited anteriorly'..."*
- *a telephone call made to the hospital in Dallas by Dr. Humes the next morning merely confirmed what was already a certainty to the pathologists--that there was a bullet wound in the President's neck at the point of the tracheotomy incision...*
- *(CE 385) was a scale drawing based on a photograph taken of the president when he was alive...*
- *the bullet path (on CE 385) was drawn using data about the entry hole and the lung bruises*

obtained during the autopsy and the precise exit wound as defined by the Dallas physicians...

- (The FBI report's reference to a back wound may have represented) *"a laymen's observation of an area just below the shoulder line that, to a physician, is still the neck region..."*

and then the standard line, pushed by Specter and Liebel, that:

- *the President, according to movie films, had his arm raised, waving to the crowds, when he was shot. This movement would have raised his coat and shirt resulting in bullet holes lower in the clothing than were indicated by the wound.*

Now, all of these claims were misleading or untrue. So...was it merely a coincidence that, just days after one of President Johnson's most trusted aides informed him that the single-bullet theory must be defended, and just days after a legal adviser to President Johnson called the acting Attorney General of the United States Ramsey Clark and proposed that a *"re-investigation"* of the medical evidence could hold off the calls for a thorough re- investigation of the murder of President Kennedy, the supposedly sworn-to-silence Dr. Boswell, who'd signed a document stating that the non-fatal wound was in the *"right superior, posterior shoulder"* barely two weeks before, suddenly granted interviews in which he claimed the non-fatal wound was *"in the neck"* and that the location of this wound left *"absolutely no doubt"* about the single-bullet theory? And was it merely a coincidence that Dr. Boswell's account of the autopsy contradicted Dr. Humes' sworn testimony about the throat wound? And that he instead claimed they'd assumed it was an exit while the body was still in front of them? And was it just a coincidence that this not-so-subtle tweak to the official story might help Johnson and his men fend off calls for an exhumation of the President's body?

No. I think not. The articles reek of an orchestrated lie.

If they were a lie, moreover, it's hard not to believe the upward migration of Kennedy's back wound between the night of the autopsy and the testimony of the autopsy doctors before the Warren Commission was similarly orchestrated, and was a migration spurred on by the climate in Washington, and not the incompetence of a couple of doctors.

Manchester Dissected

That Boswell's interviews contained deliberate disinformation, and came about as a result of a united effort to mislead the public about the location of Kennedy's back wound, finds support, moreover, in an unexpected place. By November 1966, when Boswell gave his interviews, Washington D.C. was humming with chatter on the upcoming release of William Manchester's *The Death of a President*, a book written at the request of the Kennedy family, for which Manchester had been granted unparalleled access to Kennedy's Secret Service detail. Much of this chatter, moreover, revolved around President Johnson's concern the book would make him look bad. (After finally giving in and reading the book, Jacqueline Kennedy came to agree that the book was indeed unfair to Johnson, and fought successfully for a number of edits.)

In any event, the book, when serialized in the 1-24-67 issue of *Look Magazine*, included the following description of the first shot's trajectory: *"The President was wounded, but not fatally. A 6.5 millimeter bullet had entered the back of his neck, bruised his right lung, ripped his windpipe, and exited at his throat, nicking the knot of his tie."* Now, from this, one might assume Manchester was simply regurgitating Dr. Humes' Warren Commission testimony. But there's more to this than at first meets the eye.

It then explains:

*"In the summer of 1966, a former Cornell graduate student published a **dissertation that** suggested*

*that this first bullet followed a different trajectory. The implication was that a second assassin had aided Oswald. The issue is resolved by the X-rays and photographs which were taken from every conceivable angle during the autopsy on the President's body. **Robert Kennedy has decided that this material is too unsightly to be shown to anyone, including qualified scholars, until 1971. He has turned it over to the National Archives with that restriction. Although this writer has not seen the material, he interviewed three people with special qualifications who examined it before it was put under seal. None of them knew the other two, but all three gave identical accounts of what they had seen in the photographs and X-rays.** The X-rays show no entry wound 'below the shoulder,' as argued by the graduate student. Admittedly, X-rays of active projectiles passing through soft tissue are difficult to read. **However,** the photographs support them in this case--and **clearly** reveal that the wound was in the neck. Finally, the recollections of all doctors present during the autopsy, including the President's personal physician, agree unanimously with this overwhelming evidence."*

When published in book form, three months later, moreover, the words in bold above had been re-written. This paragraph was now just a footnote, and read:

*"In the summer of 1966, a former Cornell graduate student published a **book which** suggested that this first bullet followed a different trajectory. The implication was that a second assassin had aided Oswald. The issue is resolved by the X-rays and photographs which were taken from every conceivable angle during the autopsy on the President's body. **Because the material is unsightly it will be unavailable until 1971. However, the author has discussed it with three men who examined it before it was placed under seal. All three carried special professional qualifications. Each was a stranger to the other two. Nevertheless their accounts were identical.** The X-rays show no entry wound 'below the shoulder,' as argued by the graduate student. Admittedly, X-rays of active projectiles passing through soft tissue are difficult to read. **Yet,** the photographs support them in this case--and reveal that the wound was in the neck. Finally, the recollections of all doctors present during the autopsy, including the President's personal physician, agree unanimously with this overwhelming evidence. Thus the account in the above text is correct."*

Well, I'll be. Who were these three "professionals?" While one might at first assume they were three of the four members of Kennedy's autopsy team (the four being Humes, Boswell, Stringer, and Ebersole), who'd just inventoried the evidence for the archives, Manchester specifies both that the men conducting this examination were strangers to each other, and that they'd examined the evidence before it was returned to the government and placed under seal by the Kennedy family on October 31, 1966. He also lists no interviews with these men in the Sources sections of his book.

He does list a 7-11-66 interview with Dr. George Burkley, Kennedy's physician, however. This lends support that he spoke to Burkley on this issue, and that Burkley had, yes indeed, confirmed that the wound was on the neck, as reported. There's a HUGE problem with this, however. The death certificate for Kennedy made out by Burkley on 11-23-63 described the wound Manchester describes as a wound on the "back of his neck" as a wound "in the posterior back at about the level of the third thoracic vertebra." Back, not neck. And the third thoracic vertebra--not remotely on the neck.

So who could get to Burkley, and get him to mislead Manchester about the location of the back wound? Well, it seems a bit of a coincidence that Burkley was retained by President Johnson, and was Johnson's personal physician when Manchester asked him about the back wound. It's also quite intriguing that the only known inspection of the autopsy materials prior to their being placed "under seal" was on April 26, 1965, when they were inventoried upon transfer to the Kennedy family, and that this inventory was performed by Dr. Burkley, along with Robert Bouck, Special Agent in Charge of the Protective Research Division of the Secret Service, Edith Duncan, administrative assistant to Bouck, Secret Service agent Chester Miller, and, according to some sources, Secret Service Inspector Thomas Kelley.

And yet...not only were these people not strangers to each other, they, (with the possible exception of Dr. Burkley), failed to have the *"special professional qualifications"* described by Manchester.

This, then, leads to the uncomfortable possibility the "examination" cited by Manchester took place while the autopsy materials were in possession of the Kennedy family, and that three trusted *"professionals,"* purported strangers to each other, lied to Manchester. If so, no word of this "examination" has ever surfaced.

If it even happened... Yes, it seems probable no examination of this type actually took place, and that Manchester was exaggerating both the precision of the examination he described, and the qualifications of those performing this examination.

This probability is supported by a letter published in *The Manchester Affair*, a book on the difficulties Manchester faced getting his book published. This letter was written by Manchester on 7-17-66, shortly after the publication of Edward Epstein's *Inquest*, the book by the *"former Cornell graduate student"* causing Manchester so much concern. This letter was written to Robert Kennedy, and brags: *"Epstein's Inquest, a really poisonous job, needn't trouble us any longer. With the help of Dr. Burkley and Howard Willens I think I've knocked out what, at first reading, appears to be one strong point in Epstein's version."* (The importance of this letter was first noted by Howard Roffman.)

As we've seen, in the Sources section of his book, Manchester lists an interview with Burkley on 7-11-66. Well, he also lists an interview with Willens on 7-8-66. These are the last of the hundreds of interviews listed in the Sources section. There is no record of him interviewing three men with *"special professional qualifications"* at any time this month. In fact, it had been months since Manchester had interviewed anyone prior to his interviews of Willens, and then Burkley. The probability exists then, that Burkley and Willens supplied Manchester with the identities of the three strangers with "special professional qualifications," mentioned by Manchester. Burkley, was, of course, a doctor. He saw the photos and X-rays. He was almost certainly one of the three "strangers."

But who were the other two?

A close look at Willens provides us an answer. Well, at least a possible answer. Willens had, of course, served as counsel for the Warren Commission, working as an assistant to General Counsel J. Lee Rankin. But what is little appreciated about Willens is that, unlike, the rest of the lawyers working for the commission, Willens did not come to the Commission from outside Washington, but inside. He was a lawyer for the Justice Department, strategically placed within the Commission by acting Attorney General Katzenbach, supposedly to work as a liaison between the Commission and the Justice Department.

But his actual role went further, much further.

According to Epstein's *Inquest*, for which Willens was interviewed, Willens was responsible for selecting most of the junior counsel working for the Commission. While some of these men, the work-horses of the Commission, were recommended by others, at least one was Willens' personal pick-- Arlen Specter, an old school chum of Willens', with whom he'd edited the Yale Law Journal. As Willens was also tasked with assigning these men their duties, it follows from Epstein's book that Willens was far and away the man most responsible for the strange circumstance that Arlen Specter, of all the lawyers in America, would end up being the chief investigator for the Commission on the specifics of the shooting, i.e. the man tasked with determining how many shots were fired, and from where they were fired.

Specter's 2000 autobiography, *Passion for Truth*, in fact, supports this analysis. There, Specter admits both that Willens offered him a job on the Commission and was involved in the discussions leading Specter to become the junior counsel investigating the actual shooting. Specter does clarify, however,

that Willens and Rankin offered him his choice of areas to investigate, with the exception of Area 2, which looked into the identity of the assassin (because Specter was a well-known prosecutor), and Area 4, which looked into Oswald's possible connections to Russia and Cuba (because the senior counsel for this area was also from Philadelphia), and that Specter himself made the decision to investigate Area 1 after a discussion with his law partner, Marvin Katz.

There is a strange element in Specter's account, however. He describes the area of his investigation, Area 1, as President Kennedy's activities from the moment he left the White House en route to Texas until his return to the White House after the autopsy. Well, this hides from his readers that he was also ultimately responsible for establishing the facts surrounding the shooting--how many shots were fired, how fast they were fired, and where they hit--and that this led him to orchestrate the May 24, 1964 re-enactment of the shooting, take the testimony of the FBI and Secret Service agents involved in this re-enactment, and take the testimony of two representatives of the U.S. Military on July 24, 1964, in which they played word games in order to assure the Commission Oswald was capable of performing the shooting.

And that's not all that's discomfiting about the Willens/Specter nexus. Willens was also responsible for disseminating the thousands of FBI, CIA, and Secret Service Reports provided the Warren Commission to the lawyers responsible for the related areas of investigation. This put Willens, an employee of President Johnson's Justice Department, in the driver's seat of the Commission's investigation.

And this didn't go unnoticed. When interviewed for Inquest, Commissioner John McCloy let his distrust of Willens known. He told Epstein that Willens *"was one of Katzenbach's boys. Katzenbach put him in there to keep us on the right track. There was already an independent investigator (Redlich) and there were some clashes. Willens was a bureaucrat and had a different perspective. Willens had to be reprimanded several times by the chief justice. Once he kept material from us--evidence-- he locked it in his top drawer, afraid we weren't ready for it. He wanted to be the star-- thought this case would make him. He is ambitious, and will probably write a book. We finally forced him to give us the evidence. He also reported to Katzenbach, gave him a different story."*

And McCloy was not alone in his criticism of Willens. In his final interview, a March 26, 1974 interview with Warren Commission historian Alfred Goldberg, Chief Justice Warren acknowledged he'd had difficulties with Willens. In a section slated to be edited from the typed-up interview, but viewable on jfkassassinationfiles.com, Warren noted the difficulties Chief Counsel Rankin had in dealing with the FBI, CIA, and State Department. He then added: *"There was another factor--the Department of Justice sent a young man over to the Commission to act as liaison with them. He was very critical of me from the time he came over to us. Lee Rankin as Chief Counsel was in a very delicate position."*

And this wasn't the last time Willens' loyalty to the commission was called into doubt...by a supposed colleague. In 1975, a June 3, 1960 memo in which FBI Director J. Edgar Hoover warned the State Department that someone might be impersonating Oswald bubbled to the surface. A 2-23-75 article in the Sacramento Bee on this discovery notes that *"Neither J. Lee Rankin, the former general counsel of the commission, nor any of his former staff aides who were most involved in investigating Oswald's background, said they could remember seeing it. However, Howard P. Willens, now a private lawyer here, identified himself in an interview Saturday as the commission lawyer who had reviewed the F.B.I. file. Willens, who was then the special liaison officer to the Justice Department, said that 'while I do not think that anyone can state now with the necessary precision whether or not he saw the Hoover memo, it is my best recollection that I did, in fact, see that memo. I do not want to be in a public debate with my old colleagues,' Willens said, 'but I know that there was discussion of this among others on the staff concerned with the activities of Oswald abroad. I am concerned with continued public references*

to the notion that the commission overlooked obvious facts."

Well, yeah, of course he was concerned. If he'd seen the memo, but no one else had, it meant that he, as the reviewer of the files tasked with making sure they reached the appropriate counsel, screwed up, OR made it disappear.

The article then quotes W. David Slawson, one of the 'old colleagues' Willens didn't want to debate: *"We were the rumor runner-downers, and we certainly should have seen this material, as we did a great deal of other stuff that we showed to be unfounded," he said. 'It may be more significant that we did not see it, in terms of a possible cover-up and the reasons for it, than if we had seen it. I mean, I don't know where the imposter notion would have led us--perhaps nowhere, like a lot of other leads. But the point is, we didn't know about it. And why not?' Slawson said in an interview that the investigation should be reopened also 'because the interposition of an impostor, if it happened, is a political act. And, after all, this (the assassination) was not just another murder,' he said. 'It was, by definition, a political murder.'"* (Slawson later clarified that his call for a new investigation of the assassination was a call for a new investigation limited to the actions of the FBI and CIA.)

In any event, Willens was clearly ambitious and close to Specter, and was quite possibly told by Specter that Specter and Secret Service Inspector Thomas Kelley had viewed the back wound photo on May 24, 1964, the day of the re-enactment in Dallas.

Perhaps, then, Willens told Manchester that they'd viewed the photo and that it confirmed for them that the wound was in the neck. Perhaps, then, Manchester either briefly talked to them himself, or made out like he had personally spoken to them, in order to sell what he wanted his readers to believe: that there was but one shooter, Oswald.

I have come to suspect as much. In March 2012, I contacted Wesleyan University, where Manchester's papers are stored. It had occurred to me that the restrictions placed on Manchester's many interviews applied only to interviews conducted between March 26, 1964 and April 15, 1966, and that his July 1966 interviews with Willens and Burkley were not covered. I asked an archivist if she could help me find the notes for these interviews. Alas, she told me that a thorough search through the archives' data base turned up no record for these interviews. Hmmm... This raises the possibility no notes were created, and that they weren't created because these "interviews" were little more than short phone calls in which Manchester asked, point blank, if the wound was on the back or the neck, and was told it was on the neck.

In August 2012, moreover, I found further reason to doubt Manchester's scholarship on this issue. While browsing through the Weisberg Archives, I came across a July 1967 article by Edward Epstein--the writer whom Manchester sought to discredit with his claim the back wound was on the neck--in Commentary Magazine. Incredibly, someone (almost certainly Richard Goodwin, who'd published a positive review of Epstein's book on 7-23-66, but who was nevertheless drafted by Robert Kennedy into serving as the Kennedy family's editor of Manchester's book over the tendentious months that followed) had provided Epstein an August 1966 version of Manchester's original draft, then entitled "The Death of Lancer." Included in this draft were many references to President Johnson's weakness and lack of character. It also included the earliest version of the footnote designed to discredit Epstein's book, written before the Kennedy family had released the photos and x-rays back into the hands of the Johnson Administration. It read:

"The issue is resolved by the X-rays and photographs which were taken from every conceivable angle during the autopsy on the President's body. This material is widely believed to be in the hands of the Secret Service. In fact, it is the property of Robert Kennedy, who decided that it was too unsightly to be shown to the public, or even to members of the Warren Commission staff. However, this writer is in a position to comment upon it. The X-rays show no entry wound "below the shoulder," as argued by the

graduate student. Admittedly X-rays of active projectiles passing through soft tissue are difficult to read. However, the photographs support them in this case—and clearly reveal that the wound was in the neck."

Epstein then reveals that "When asked about this footnote by Richard N. Goodwin, who was then acting as a consultant on the book, Manchester let it be understood that he had personally studied both the X-rays and the photographs of the autopsy. Yet, as Goodwin later learned to his dismay, permission had never been granted Manchester to examine the photographs. When presented with this fact, Manchester admitted that he had actually never seen either the X-rays or photographs, but was reluctant to change the text which was then being rushed to publication by Look. Finally, under editorial pressure, he inserted a statement in the final version to the effect that he had not personally seen the autopsy pictures, but had discussed them with three men, each a stranger to the others, who carried "special professional qualification" and who had examined the evidence. Each gave, according to Manchester, accounts "identical" to the one he had reported in his August footnote."

While Epstein went on to suggest that these three unnamed strangers were not real, and were invented by Manchester to cover his tracks, it seems probable, based upon Manchester's interviews of Willens and Burkley, and subsequent letter to Robert Kennedy, that Manchester was merely trying to hide the identities of the men he'd spoken to, and had decided to let Goodwin think he'd personally viewed the autopsy materials. If this is so (that Willens and Burkley had only spoken to Manchester under the condition their identities not be made public, and Manchester had sought to hide their identities from Goodwin and others), well, then, this might explain why Manchester left behind no notes on his interviews with Willens and Burkley: he'd destroyed them.

Military Review Review

Does the photo center and above
make it "clear" that the depiction
of a wound in the drawing
at left is "accurate?" If not, why
would the "Justice Department"
have a military surgeon fly back
from Vietnam to say so?

Military Review Review

The November '66 Boswell interviews were, however, not the last time the autopsy doctors talked to the news media and deliberately misrepresented the back wound location.

On January 20, 1967, the Justice Department asked the doctors to re-examine the autopsy photos. For this inspection, Dr. Finck was rushed back from Viet Nam.

The urgency of this review, moreover, appears to have been linked to an upcoming CBS News program re-investigating the assassination.

That CBS' over-all conclusions were pre-determined and were designed to re-sell the Warren Report to the American people (CBS had run a special supporting the Warren Report when it was first released) is suggested, moreover, by a January 11, 1967 memorandum from Les Midgley, Executive Producer of the upcoming program, to former Warren Commissioner John McCloy. There, Midgley cites a need for "*a statement—if possible—from Humes, Boswell and Finck that examination of the x-rays and color pictures does not change their findings, and we certainly would appreciate your assistance in obtaining same.*" This memo, for that matter, may have been written in response to a 1-14-67 Saturday Evening Post article already on the street claiming "*no single element of the commission's version of the assassination is more suspect than the official account of the President's autopsy.*"

In any event, the memo appears to have reaped some rapid rewards. According to McCloy's biographer, Kai Bird, McCloy traveled to Washington THAT VERY SAME DAY and met privately with a number of top government officials including Secretaries of State, Defense, and Treasury, Dean Rusk, Robert McNamara, and Henry Fowler. That Archivist Robert Bahmer wrote researcher Harold Weisberg on 1-16-67 and told him that no examinations of the autopsy photos and x-rays were pending, and that Dr. Finck received a phone call on 1-17-67--the VERY NEXT DAY--telling him to come to

Washington and conduct the examination proposed by Midgley but 6 days before, then, suggests that McCloy, who had been advising CBS News President Richard Salant on the creation of their upcoming program since early December, and *whose daughter was Salant's assistant*, may have talked to someone in the Justice Department as well.

That Midgley's memo also mentions his hopes of obtaining Dr. Humes' help in resolving "*forever the discussion about back versus neck wound*," and that Humes not only made an appearance on the program, but flat-out lied about the "*back versus neck wound*" to Dan Rather, is suggestive as well that McCloy's visit may have been not only the impetus for the doctors' January review of the autopsy materials, but the determinant of their written conclusions.

Something is just wrong. When one looks at the report of the so-called "military review," dated January 26, 1967, one can see that the photographs were not merely cataloged by the doctors, but re-interpreted to show that they did indeed confirm the findings of the Warren Commission. One of the autopsy photos determined to have been taken from behind Kennedy on the November inventory list was now determined to have been taken from in front of Kennedy. And that's not the worst of it. Amazingly, the photos determined on November 1, 1966 to represent a wound in the "*right superior posterior shoulder*" were now described as representing a wound "*low in the back of the neck*." Even worse, the report asserts that the original autopsy reports' description of this same wound as residing in "*the upper right posterior thorax*," meant that, in layman terms, it was low in the back of the neck. Since the thorax ends when it reaches neck, this would be the same as saying that Governor Connally's wrist wound was in layman's terms a hand wound, or that the City of Las Vegas is, in layman's terms, in California. No doctor would make this mistake. The report goes on to say "*No one photograph shows both the wound at the back of the neck and the wound in the throat, but by comparing Photographs 11, 12, 38, and 39 with the side views shown in photographs 1-4, inclusive, it is clear that Warren Commission Exhibits 385 and 386, which also depict the location of the neck wound, are accurate.*"

Dr. Humes told this same tale on CBS six months later.

Well, this goes too far. There is no way one can say that CE 385 and CE 386 are accurate, as they portray a bullet hole at the base of the neck, inches above and to the right of the wound on the autopsy photo. In fact, since the Dox drawing of the back wound taken directly from the autopsy photos was published by the HSCA, one can state unequivocally that this is a damned lie. Not one defender of the Warren Report will defend this statement.

Is it simply a coincidence then that the doctors claimed to have no memory of this report when asked about it by the ARRB?

Owing to their suspicious memory loss, and the suspicious change of the description of the autopsy photos, and the outright lie that the photos confirmed the accuracy of CE 385 and 386, I believe it's logical to conclude this report was created for political purposes...and that the doctors were forced to sign their names to it.

Dr. Finck's notes on his urgent trip to Washington support this contention. There, he refers to the wound described in the report as a "*neck wound*" as simply "*Entry, back*." There, rather than describe in detail the process by which the doctors composed their report, he declares that a "*statement had been prepared by the Justice Department. We signed the statement.*"

Call me overly sensitive if you like, but the rank odor rising from this review only adds to the rankness of Earl Warren's earlier decision not to allow an inspection of the autopsy photos, after telling Chief Counsel Rankin it would be fine. Something was rotten in Washington.

A 1-21-67 phone call from Attorney General Ramsey Clark to President Johnson supports that something was rotten, and that the autopsists were pressured into changing their interpretation of the

wounds for this report. The tapes of this phone call, as transcribed by Warren Commission defender Max Holland, reveal that Clark told Johnson that the doctors "*feel their professional reputations are at stake*" and that "*they're so reticent about signin' anything, that it's fairly difficult to work with 'em.*"

Well, reticence implies resistance, does it not? What were they resisting? On January 26, 1967, Clark adds more fuel to this fire by telling Johnson "*we have the three pathologists and the photographer signed up now on the autopsy review.*" When used in this context, the words "*signed up now*" would indicate the doctors were under pressure to go along with something, would it not? And why, after the doctors had inspected the photos on the night of January 20th and had stayed in the archives till midnight preparing a "*statement comparing the illustrations with our autopsy report,*" according to Dr. Finck's notes, did it take Clark almost another week to get them to sign a 5 page report "*prepared by the Justice Department?*" Was the doctors' original statement re-written by the Justice Department? What was in this re-written report that made the doctors so reticent? And what if anything, changed their minds? Could the doctors have been given direct orders to cooperate? And if the doctors had come to their conclusions purely on their own, why couldn't they remember their decisions years later or stand by them?

Intriguingly, Johnson is reported to have contemplated re-opening the investigation at this time. This was but a few months after Johnson had asked the FBI to figure out the Soviet Union's position on the assassination--and if it was responsible for the widespread criticism of the Warren Report--only to be told that the Soviets had long believed Kennedy was killed by the "ultraright," but had recently concluded Johnson himself was "responsible." This was within days, moreover, of Johnson's finding out about the CIA's assassination plots against Cuban leader Fidel Castro, and the possibility these plots had backfired, and had led to the bloodshed in Dallas.

While Johnson is purported to have decided that such an investigation was not in the best interests of the nation--or for the Kennedy family--there is reason to doubt this was true. As we've seen, Johnson thought Robert Kennedy was out to destroy him, and was out to destroy him in turn. This, then, undercuts any notion that Johnson was protecting the Kennedys. One can only wonder then if the problems with the doctors and autopsy photos was a bigger factor in his decision not to re-open the case.

As for Clark, I have been unable to find a single reference by him to the January 1967 review of the autopsy photos and x-rays, subsequent to his conversations with Johnson. In his 1978 interview with the HSCA's Andy Purdy, he said the 1968 Clark Panel was formed after the autopsy photos and x-rays became available and after Finck, Boswell, Humes and Ebersole's review proved inadequate. (Inadequate at what, one wonders--shutting down the critics?) Anyhow, this statement is confusing on the face of it because it makes it sound like there was but one review and that those four men were involved, when, in fact, Ebersole was only involved in the 1966 inspection and Finck was only involved in the 1967 inspection.

A 1998 interview with researcher James Douglass proved equally unsatisfying. Here, Clark told Douglass of obtaining the materials and calling in the doctors to make their initial inspection and then jumped to the creation of the Clark Panel in 1968. Either Clark had forgotten there were two separate reviews in 66 and 67 or he found discussion of the second review uncomfortable.

As for McCloy, his motivation for helping CBS debunk the conspiracy theorists and defend his work with the Warren Commission seems obvious. In a mid-70's letter to Warren Commission counsel David Belin, quoted in an 11-20-88 New York Times piece by Belin, McCloy complained: "*I never cease to be amazed at the willingness of so much of the public to accept the statements of the charlatans and sensationalists rather than the facts and the record.*" He then recalled the political climate in the mid-sixties: "*It was actually thought 'liberal' to be convinced that President Kennedy had been shot as a*

result of a conspiracy by a group of Texas millionaires or chauvinists and that it was quite 'illiberal' to think that he has been assassinated solely by a little 'punk' who perhaps had some communistic leanings."

How far McCloy was willing to go while assisting CBS in their quest to re-assert "*the facts and the record*" is made clear, moreover, by contrasting his video-taped response on the CBS program against his private correspondence with Belin years later. On the CBS special he said "*It was our own choice that we didn't subpoena the photographs, which were then in the hands of the Kennedy family.*" (This was not true; throughout the entire duration of the Warren Commission the autopsy photos were in the sole possession of the Secret Service. The Kennedy family and the Justice Department not only didn't control them, they never even saw them.) He then proclaimed "*Mr. Justice Warren was talking to the Kennedy family about that at that time. I thought he was really going to see them, but it turned out that he hadn't.*"

Now compare this to McCloy's mid-70's letter to Belin: "*I agree wholeheartedly with your criticism of the Commission itself for failure to demand the original x-rays and photographs. **I agreed to having the Chief Justice's viewing them alone if he would do so and I understand he was to do this.** The argument against their being viewed by the commission as part of the record was that the X-rays and photographs of the President's body did not in themselves carry as much weight as the interpretation of them by the experts. This together with what I thought to be the oversensitivity of the Chief Justice to the attitude of the family, resulted in a good bit of just criticism of the commission which in my judgment could have been avoided...*" Notice that he doesn't say "I mistakenly believed he would do this" or "he led me to believe he would do this." No, McCloy says that he agreed to let Warren inspect them alone and that it was his understanding that Warren did indeed inspect them alone. This, then, suggests that he knew Warren had seen the photos, and this, in turn, suggests he'd lied to CBS and the world when he said that Warren had not.

Note also that, according to Belin, this letter was written in the mid-70's. On 9-21-78 (the late '70's), McCloy testified before the HSCA, and admitted: "*I think we were a little lax in the Commission in connection with the use of those X-rays. I was rather critical of Justice Warren at that time. I thought he was a little too sensitive of the sensibilities of the family. He didn't want to have put into the record some of the photographs and some of the X-rays taken at the time. We took the testimony of course, of the doctors and probably with the X-rays--we wouldn't have been able to read the X-rays if we hadn't had the doctors' testimony.*" Note that he failed to mention Warren's looking at the photos and x-rays all by his lonesome, and the ridiculousness of Warren's not allowing the doctors who'd created these materials to inspect the photos and x-rays to verify the accuracy of their testimony. I mean, if Warren could look at the autopsy materials without putting them into the record--why the hell couldn't the men who'd actually created the materials, who'd seen Kennedy's body with their own eyes?

There's yet another intriguing aspect to McCloy's letter to Belin... The sentence in bold appears in the version of McCloy's letter published in Belin's November, 1988 book *Full Disclosure*, but was edited out of Belin's 11-20-88 article in the *New York Times*. Now, this could have been done for a number of reasons--perhaps Belin was trying to conceal that Warren had seen the photos... 11 years after the publication of Warren's autobiography in which he admitted seeing the photos. Or perhaps Belin simply felt this sentence a distraction from his overall point...

Or perhaps he'd become aware of McCloy's previous claim Warren had not seen the photos, and decided to do a little house-keeping... McCloy was 93 at the time, and would die early the next year... Perhaps he or someone close to him had given Belin a call...

In any event, it seems likely McCloy lied when he told CBS Warren had not seen the photos. Well, why would he have done this? To protect Warren? Well, if he was willing to lie to protect Warren on such a

minor matter then what reason do we have to believe anything he had to say?

And what about CBS? Since when do news divisions tell members of government commissions what types of reports will help shut down political rumors? And since when do they ask that such reports then be created? I mean, isn't that crossing a line between reporting the news and orchestrating the news? And why did CBS consider it their job to shut down rumors anyhow?

Perhaps as an acknowledgement that his behavior was not quite kosher, Les Midgley never mentions McCloy's "help" on the special in a book he co-wrote about the creation of the CBS special entitled *Should We Now Believe The Warren Report?* He never mentions it in his memoirs, entitled *How Many Words Do You Want*, either. While in this latter work Midgley does mention McCloy's appearance on the program, he downplays McCloy's crucial role, and even says "*McCloy was doubtful about participation, although he did, in the end, agree.*" Throughout both books, for that matter, Midgley staunchly defends his program: "*the avid critics and attackers thrive in a mental climate such that most of them undoubtedly believe CBS, its News Division, and its staff to be part of a vast conspiracy to conceal the "facts" about the assassination...They are wrong but nothing can be done about it...The people who wrote, filmed, produced, and appeared on these broadcasts would have been the happiest journalists of this or almost any other century if they could have come up with a sensational "solution" to the Kennedy murder...But it didn't happen.*"

Well, never mind believing the Warren Report. Based upon what we now know of Midgley's behind the scenes dealings with McCloy, should we remotely believe him? I'm undecided. Since Midgley's memoirs were written when he was in his seventies, it's possible he left out his indiscreet contact with McCloy for the same reasons he said that Connally was riding beside Kennedy at the time of the assassination and the magic bullet was found on the floor of the limousine...perhaps he was simply an old man who could no longer remember the facts.

On the other hand, it seems a bit of a coincidence that Associated Press writers Sid Moody and Bernard Gavzer conducted a seven-month long investigation into the issues raised by critics such as Epstein, Lane, and Weisberg, and published their series the same week as the CBS telecasts, with nearly identical conclusions!

This coincidence becomes even more intriguing, moreover, when one realizes that Moody and Gavzer were granted interviews with 11 of the 15 Warren Commission counsel and 4 of the 10 staff for their investigation. Many of these men had spoken to Edward Epstein for his book *Inquest*, and had been embarrassed when Epstein used their words to expose the limitations of the commission's investigation. As one should have real doubts these men would turn around and allow such access to an investigation whose outcome was uncertain, one might reasonably conclude then that the AP's investigation was designed as a Warren Commission defense from the beginning.

Perhaps it was even coordinated with CBS through the "Justice Department."

Incredible? Read on.

Defending The Line

Above: autopsy face sheet prepared by Dr. Boswell, November 22, 1963. This one has been verified by Kennedy's personal physician, Dr. Burkley, the only doctor to observe Kennedy's wounds in both Dallas and Bethesda. This drawing depicts what is clearly a back wound.

Which of these drawings is more precise? Which of these drawings more accurately reflects the location of the back wound?

Above: Warren Commission Exhibit CE 385, created for the testimony of Dr. Humes by Skip Rydberg, March, 1964. Here, the entrance is at the base of the neck

At left: a crop from the back wound photo reviewed by Dr. Humes on 1-20-67. Does this show an entrance "on the base of the neck?"

Defending the Line

On May 27, 1967, Acting Assistant Attorney General Carl Eardley wrote a letter to Dr. James J. Humes telling him that CBS News had requested permission to interview him for a television special and that the attorney general had no objection to his appearance. As Dr. Humes was under an order of silence from the military since the day of the autopsy, and as the White House renewed this directive right before the Warren Report was published, Dr. Humes could only speak to CBS News by permission. Two days later, Cliff Sessions, the Director of Public Information, wrote a memo to Eardley which included talking points for Humes to follow when questioned by Dan Rather on this special. Humes, to his credit, gave this memo, complete with talking points, to the ARRB.

Among the talking points provided Humes was that one bullet "*entered the back of the neck and exited through the throat,*" that the autopsy face sheet depicted this wound much lower than it really was, and that "*the location of the wound was accurately described in a notation on the margin of the drawing.*" It ended by stating that Humes had "*thoroughly examined*" the photographs and x-rays at the National Archives and that they supported in "*every detail*" the "*autopsy findings which were reported to the Warren Commission.*" Whether or not the Justice Department's providing Humes with this script was intended to communicate that he should not waver from this script is open to conjecture, but when asked about the locations of Kennedy's wounds by Rather in a taped interview first broadcast on June 26, 1967, Humes described the back wound as "*in the base of the neck on the right.*" When Rather followed up by asking about the conflicting locations of the back wound on the autopsy face sheet and Rydberg drawing CE 385, Dr. Humes inspected CE 385 and contended that the face sheet was never meant to be precise but that "*the second drawing which you have mentioned (CE 385) was prepared as we were preparing to testify before the Warren Commission, to rather schematically and as accurately*"

as we possibly could, depict the story for the members of the Warren Commission... We were trying to be precise and referred back to our measurements made in the margins of the other drawing....since this time we have had opportunity to review the photographs which we made at that time. And these photographs show very clearly that the wound was exactly where we stated it to be in our testimony before the Warren Commission, and as it is shown in this drawing." Rather then re-asked: "Your re-examination of the photographs verify that the wounds are as shown here?" To which Humes replied "Yes sir, they do."

This was simply not true. Humes was not only being deceptive about the accuracy of the Rydberg drawings, but about the inaccuracy of the face sheet. As demonstrated throughout this chapter, the back wound location on the face sheet had been marked in accordance with the measurements, while the Rydberg drawings were made from verbal descriptions only. This, then, suggests that Humes was lying through his teeth when speaking to Rather.

There is yet another reason to suspect Humes lied to Rather and CBS, and that this lie was orchestrated by the Justice Department. And that's that Humes wasn't the only one misrepresenting the back wound location on the program. Yep. While Humes was the only member of the autopsy team to comment on the autopsy photos in the program, he was not the only person to have seen an autopsy photo to misrepresent the location of the back wound in CBS' 4-part special. The other person was--you guessed it--Arlen Specter, the man most responsible for the development of the single-bullet theory. Specter, whose viewing of the back wound photo in 1964 had been discussed at least three times (anonymously in the 8-28-66 Philadelphia Bulletin, but by name in the 10-10-66 U.S. News & World Report and 1-14-67 Saturday Evening Post) within a year of his appearance on the program, had, we should remember, been hired for his job with the commission by Howard Willens, the Justice Department's point man on the commission.

So what did Specter say? Well, while discussing the President's wounds with--you guessed it--Dan Rather, Specter twice referred to the back wound as a "*wound on the President's neck*." Now, some might say "Ugggh, it *was* a wound on his neck, stupid--did you forget that the bullet supposedly exited from the throat?" and want to give Specter a break on this, I firmly believe such a break is unjustified, as people--at least the people I know--just don't speak in that manner. I mean, no one I know would describe a bullet entering the back and exiting the throat as a bullet "inflicting" a "wound on the President's neck." And I assume your friends are no different.

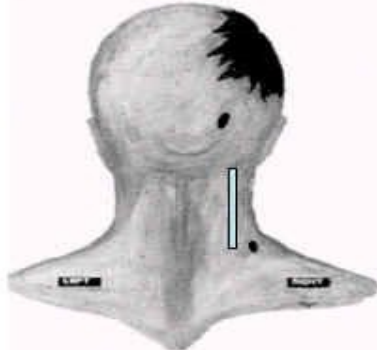

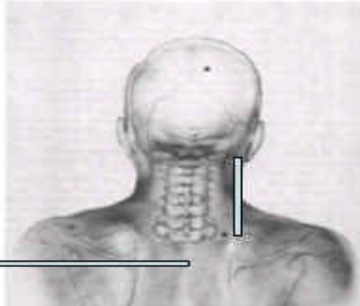

And it's not as if Dr. Humes' interview with Rather was the last time the autopsy doctors misrepresented the back wound location...under pressure from the "Justice" Department.

During the January, 1969 trial of Clay Shaw, the subject matter of the film JFK, it became Dr. Finck's turn to fudge the facts. Although Dr. Finck's testimony on behalf of Shaw had been orchestrated by the Justice Department, and was intended to convince the jury that the medical evidence pointed towards Oswald acting alone, Finck's strange demeanor and surprising answers confused almost everyone. At one point, in fact, he was doing so badly that Carl Eardley rushed Dr. Boswell down as a possible replacement. In any event, in his testimony, Dr. Finck described Kennedy's back wound as a wound on the "back of the neck" not once but 33 times. This was suspicious, particularly in that in his testimony before the Warren Commission, his military reports to his superiors, and an article he'd written for Military Surgeon magazine, he had never once described the wound in such a manner, and had instead described it as being in the "upper back" or in the "right upper region of the posterior thorax." In fact, as far as can be determined, he has never claimed it was on the "back of the neck" before or since his testimony in the Shaw trial. During his testimony before the HSCA, for example, he said the wound was on the "upper back/lower neck" 5 times, even though he had not seen the photos in the intervening years, and had no reason to add in the "upper back" outside a desire to be accurate.

So...yeah, it seems clear someone briefed Finck before his testimony, and instructed him to say the wound he'd previously claimed was on Kennedy's back was instead on the back of his neck. As a military report Finck filed on his participation in the Shaw trial discloses that he had a meeting with Acting Assistant Attorney General Carl Eardley shortly before his testimony, we may even know the name of this person.

It seems obvious then that the doctors were under intense pressure from the Justice Department when they publicly misrepresented the location of the back wound. While this may seem an argument for a vast government conspiracy, it is undoubtedly possible that those putting the pressure on the doctors felt they were merely defending the government's line against its critics, and not protecting any possible conspirators. As for Carl Eardley, who supervised the doctors' re-inspection of the photos in January, 1967, and presumably saw the photos himself, it would have only been fair for him to have been asked on national television, with the eyes of the nation upon him, where the neck ends and the back begins, and whether the wound in question on the autopsy photos was on the neck or on the back.

The Incredible Shrinking President

 <p>Warren Commission Exhibit CE 386 March 16, 1964</p>	 <p>Fox left lateral photo, image inverted Clark Panel interpretation</p>	 <p>HSCA Figure 24 March 24, 1979</p>	 <p>Fox left lateral photo, image inverted. HSCA interpretation</p>
<p>From the mastoid process to the back wound is 14 cm. If this drawing was based upon the autopsy protocol's measurements of the wound location, as Dr. Humes testified, Kennedy's skull was over 27 cm wide.</p>	<p>From the mastoid process to the back wound is 14 cm, with the bottom margin of the tracheotomy incision 5 cm below. Once again a giant.</p>	<p>From the mastoid process to the back wound is 13 ½ cm. An exit wound 5 cm below this wound (as in the Clark Panel's measurements) would place it well below his throat.</p>	<p>The throat wound is instead 1 cm above the back wound.</p>

The Incredible Shrinking President

Scarcely a year after the military review, however, it was determined that yet another examination was needed, this time without the input of those present at the autopsy. While the inspiration for this new panel purportedly came from Dr.s Boswell and Humes, who, according to a letter written by Boswell to the Justice Department, wished for a second opinion, Dr. Boswell's testimony before the ARRB reflects that he wrote this letter only after Carl Eardley *"called me out of the blue...and said they thought it was a good idea to have an independent panel...now I had been talking about this with perhaps him and other people...And whether Carl suggested it or whether I convinced him, I'm not sure. But, anyway, he was willing to accept the letter, which he essentially described to me what they wanted, and I wrote*

it.”

This suggests then that Boswell's letter was but window dressing to disguise the fact that someone in the government, possibly even the President himself, wanted a new panel formed. It's helpful, then, that Johnson's Attorney General Ramsey Clark later accepted credit for the panel's creation, telling an HSCA investigator that he felt the earlier examination by the doctors was “*inadequate*,” and that this had led him to create a new panel.

Clark was actually quite forthcoming. He also told his interviewer he was present when the doctors viewed the photos, and that he'd viewed the photos himself. He also said he drew a line with the doctors: that they were not there to re-open the Warren Commission's investigation, but to see what was shown in the photographic evidence. He also said he was “relieved” when the experts corroborated the findings of the Warren Commission.

Heck, he even acknowledged that he'd used Jim Garrison's trial of Clay Shaw as a vehicle for releasing the panel's report.

This last acknowledgement appears to be a bit disingenuous, however, as it seems clear Clark's decision to get a second opinion in the first place was that Jim Garrison, the district attorney of New Orleans, had both pressed for access to the Kennedy assassination medical evidence and added President Johnson onto his list of suspects in President Kennedy's murder.

Clark nearly admitted as much. In his book *Crime in America*, published 1970, Clark questioned Garrison's mental health. He claimed Garrison's conduct during his investigation of Shaw was “*abusive*,” and that his “*charges of conspiracy reaching even into the Federal Government*” were “*bizarre*.” Such a man, in Clark's mind, would no doubt be capable of stretching the slightest inconsistency into the appearance of a vast conspiracy.

Well, it only makes sense then that Clark--with or without the support of President Johnson, whether he was involved in the assassination or not--would endeavor to find out just what the photos showed before Garrison did, and would want to make sure there was nothing in them that Garrison could use to question the legitimacy of Johnson's presidency.

It's also worth noting that, by February, 1968, Johnson had decided not to seek another term in office. It seems possible then that he wanted to be sure the photos showed no evidence for a conspiracy, lest the next President, who in his worst nightmares would be Robert Kennedy, the deceased President's younger brother, use the photos to re-open the investigation into President Kennedy's murder and damage his--Johnson's--prized legacy.

But no matter the precise reasons for the panel's creation, it's clear it served a purpose politically. Although the panel was conducted in secret on February 26, 1968, its report was not released until January 16, 1969, the day Jim Garrison's prosecution of Clay Shaw finally went to trial. Four days later, Johnson left the presidency.

What was surprising about this panel, however, was that it agreed with the many assassination researchers on a central point--that the autopsy report's description of an entrance wound low on the back of Kennedy's head was incorrect. Instead, the secret panel proposed that the entrance hole in the back of the President's head was 4 inches higher than described in the autopsy report, at a point often described as a cowlick. While the skull photographs and x-rays were certainly influential in their decision, another factor apparently was that the photos of the President's brain revealed no path of destruction linking the cerebellum (the point nearest the entrance in the President's hairline displayed in the Rydberg drawing) with the clearly devastated upper right lobe of the President's brain (where the bullet was presumed to have made its exit).

While much has been made of this movement of the head wound--mostly by conspiracy theorists delighted that Dr.s Humes and Boswell were made to look foolish--these same theorists miss that the Clark Panel itself made as many or more substantive mistakes as Dr.s Humes and Boswell.

Some of these mistakes, in fact, cast doubt upon the integrity of the panel. To begin with, even though the Clark Panel determined the head wound in the photos to have been four inches higher on Kennedy's skull than the one described in the autopsy report, they stuck by the measurements of the wound, only transposing the numbers. This 6 by 15 measurement, however, was not anywhere near the proportions of the mark in the cowlick in the autopsy photo they claimed as the entrance.

Even stranger, the Clark Panel claimed the back wound was 7 by 10, longer than wide, when the close-up photo released by the HSCA proves it to have been wider than long.

This suggests then that these doctors were following in the footsteps of Humes and Specter, and describing the wounds as longer than wide to help create the illusion the shots came from above.

And that's not the only reason to dis-believe...

- Let's start with something simple. The Clark Panel, in concurrence with the autopsy report, concluded that the back wound was 14 cm below the mastoid process of Kennedy's skull. It also claimed, however, that the back wound was *"5.5 cm below a transverse fold in the skin of the neck,"* also visible in the back wound photo. It follows, then, that this fold was 8.5 cm below the mastoid (which is at the approximate level of the bottom tip of the ear)...and much closer to the back wound than to the mastoid. Now look at the lateral autopsy photo on the slide above. Is it remotely possible that the fold is 8.5 cm (over 3 1/2 inches) below the mastoid? No. There's no way that fold can be 3 1/2 inches from the mastoid. This suggests then, that the Clark Panel has somehow inserted extra space between the mastoid and the skin fold (perhaps in order to pretend their findings were consistent with the autopsy measurements) whilst simultaneously moving the back wound up the neck.
- Beyond concluding that the back wound *"lies approximately 5.5 cm below a transverse fold in the skin of the neck,"* the Clark Panel also asserted that the bullet wound in the throat was *"above the trachea incision"* and *"situated approximately 9 cm below the transverse fold in the skin of the neck described in the last paragraph."* They were thereby presenting the throat wound as 3 1/2 cm below the back wound.
- The HSCA medical panel, conversely, proposed that the throat wound was 1 cm above the back wound. This means the two panels were 4 1/2 cm apart on their interpretation of the relative placement of these wounds.
- Actually, more. The HSCA medical panel also proposed that the throat wound was on the bottom margin of the trachea incision, which was 1 1/2 cm wide. This means that, from the perspective of the HSCA, the Clark Panel's throat wound location was not 1 cm above the HSCA's back wound location, but 2 1/2 cm.
- So let's be clear: the Clark Panel proposed the back wound was 3 1/2 cm above the throat wound, which was 2 1/2 cm above the HSCA's proposed location for the back wound. This means there's a 6 cm difference in interpretation of the back wound location when compared to the throat wound. Now, if the Clark Panel's back wound location is 6 cm higher than the HSCA's back wound location, the problem can be directly linked to a difference of opinion on the back wound's location. Only no such luck.
- As stated, the Clark Panel concurred with the measurements taken at autopsy and concluded that the back wound was 14 cm below the mastoid process. When one takes into account that the HSCA's back wound location was, in the eyes of the Clark Panel, another 6 cm below this location, then, in order for both panel's measurements to be correct, the HSCA's back wound

location would have to be 20 cm below the mastoid process. This they did not do. The HSCA medical panel instead determined this wound to be about 13 1/2 cm below the mastoid process.

- The HSCA's measurements are the more accurate. The Clark Panel held that the back wound was 14 cm below the mastoid, and that the throat wound was 3 1/2 cm below this point. This location was, furthermore, 1 1/2 cm above the throat wound location as determined by the HSCA, along the bottom margin of the tracheotomy incision. This means that, in order for the Clark Panel's measurements to be correct, the bottom margin of the tracheotomy incision must have been 19 cm below the mastoid process. The measurements of the HSCA medical panel, on the other hand, place the bottom margin of the tracheotomy incision about 12 1/2 cm below the mastoid process. I have measured this location on myself and others and the HSCA's measurement is far more accurate. A wound 12 1/2 cm below the mastoid would be between the Adam's Apple and sternal notch, where Kennedy's wound was located. A wound 19 cm below the mastoid would, in contrast, be a wound overlying the sternum, about the level of the top of the heart. This suggests then that, for the Clark Panel's measurements, they'd somehow added an extra 6 1/2 cm (over 2 1/2 inches) onto the front of Kennedy's throat, basically doubling its length. Now why would they have done this, other than to lower the throat wound location, and help sell the single-bullet theory they'd been asked to review? Were they deliberate liars? Or simply incompetent?

Only adding to the likelihood the Clark Panel lied is that they re-measured the hole in the back of Kennedy's jacket, and claimed it was 12 cm below the upper edge of the coat collar. The FBI had previously measured this distance and found it to be 5 3/8 inches, or 13.6 cm. The HSCA would subsequently measure this distance and find it to be 13.5 cm. It seems more than a coincidence then that the FBI and HSCA measurements were off by but 1 mm, and the Clark Panel's measurement was off by 15 times as much, particularly when this "mistake" by the Clark Panel helped them sell the single-bullet theory already supported by their clearly inaccurate wound location measurements.

One is tempted to conclude, therefore, that the Clark Panel was the fully-orchestrated cover-up many believed the Warren Commission to have been. This suspicion is only heightened, moreover, by the peculiar fact that the Clark Panel is the only review of the autopsy evidence to have a representative of the American Bar Association along to serve as "legal counsel to the panel," and to "collaborate" with the panel in the "preparation" of its report. Such an overt conspiracy is made doubtful, however, by the Clark Panel report's acknowledgment that the Warren Commission's wound in the "back of the neck" in fact entered in the "back" and its description of several strange things that were never even noticed by the doctors on the night of the autopsy, including metal fragments in the President's neck, a large round fragment at the back of the President's skull, and a strange shape in the President's brain. If they were deliberately covering up, after all, it seems doubtful they would have opened fresh doors to such previously unexamined mysteries. The probability remains, then, that on some of its findings the Clark Panel was well-intentioned, but just horribly, horribly wrong.

But you really gotta wonder. When one compares Warren Commission CE 386 with HSCA Figure 24, and adjusts their size based upon the measurements contained within their respective reports, one can see that the skull in the Warren Commission drawing is roughly 27 1/2 cm from ear to ear, the skull of a giant, while the skull in the HSCA drawing is 19 cm, much more in line with a normal human skull. When one sizes a photo of Kennedy using the Clark Panel's measurements, moreover, one finds it to be in line with the clearly inaccurate CE 386. This is a bit shocking. That the Clark Panel's measurements reflect a body as large as the one in the Rydberg drawings, approximately 50% larger than life--and that these mistakes help support the single-bullet theory--should make one suspect that the members of the Clark Panel, as with the military doctors before them, were pressured by the Justice Department into supporting the single-bullet theory.

Researcher Harold Weisberg sure smelled a rat. He attempted to gain access to the working papers of the Clark Panel, and, after being told that the working papers had been destroyed, personally contacted the various members of the panel. In his book *Post Mortem* Weisberg includes a small section on his correspondence with these men. He relates that Dr. Russell Fisher was the leader and spokesman for the panel. In a letter to Weisberg, Fisher claimed that “*quite some time after the panel report had been submitted*” he conducted tests on cadavers to see if a bullet could go through a human neck as proposed by the single-bullet theory. Fisher explained, moreover, that this was “*purely to satisfy my own interest,*” and that he'd made no effort to file a report on these tests, or share his results with his fellow forensic pathologists.

It may seem strange, then, that Fisher was all too happy to share his results with Weisberg. He told him “*we were convinced it was possible for a bullet tract to connect the entrance and exit wounds without being deflected by, or hitting the bony vertebrae.*”

There's a problem with Fisher's story, however. Fisher also told Weisberg that “*The measurements...can be assumed to be accurate. They were measured by scale. We had photographs which showed a scale. We were able, therefore, to confirm the measurements...*”

As we've seen, however, this last assertion is incorrect. The Clark Panels' measurements for the relative positions of the back wound and throat wound were embarrassingly inaccurate. The inaccuracy of these measurements, moreover, should make us question the accuracy of whatever tests Fisher performed on the entrance and exit wounds.

I mean, seriously, did he shoot the cadavers on a downward trajectory, as theorized in his report? If he did then he should have realized that either the entrance wound was much higher than the entrance wound on Kennedy's back depicted in the autopsy photos, or the exit wound much lower than the location of the tracheotomy incision.

Perhaps, then, Fisher simply lied to Weisberg to get him off his back...

A final point learned from Weisberg's contact with Fisher should come as no surprise. Fisher told Weisberg that, when completed, the Clark Panel's report “*was transmitted by Mr. Bruce Bromley to Mr. Carl Eardley of the Justice Department.*” Eardley, of course, had previously worked with the autopsy doctors, and was the Justice Department's point man on the medical evidence.

Chapter 11: The Single-Bullet Theory

Lattimer Analysis

Warren Commission
Exhibit CE 385

Fox Autopsy Photo

Lattimer drawing
from book:
Kennedy and Lincoln

Actual position of lungs
in torso.

Note that in Lattimer's analysis the bullet enters at an even higher point than in the Rydberg drawings.
Note also that he's lifted the lungs to be closer to the bullet path.

For reasons beyond my grasp, the first image in each chapter sometimes fails to appear. If there's nothing up above, don't despair; you can still see the image [here](#)

Lattimer Analysis

Only adding to my suspicion that the Clark Panel deliberately misrepresented Kennedy's wounds to support the single-bullet theory is the strange coincidence that the next person to look at the photos, and the *very first* member of the private sector to be allowed to inspect the autopsy photos and x-rays, just so happened to be Dr. John K. Lattimer, the aforementioned urologist to FBI Chief J. Edgar Hoover.

This was suspicious for a number of reasons. Not only was Lattimer not a forensic pathologist, and not only had he headed a Federal Government research program from the late 1940's to the mid-1960's, but he'd written extensively on the JFK case already, always at a time when the public's interest was heightened, and always with the conclusion that the Warren Commission had properly addressed the evidence. In mid-1966, just as books critical of the Warren Commission were starting to get wide-spread attention, there was Lattimer, with an article in The New York State Journal of Medicine comparing the deaths of John Wilkes Booth and Lee Harvey Oswald, in which Oswald was described as "*an enemy (communist) sympathizer*" and an "*attention-hungry fanatic*." In late 1966, moreover, as doubts about Oswald's shooting ability were sweeping across the nation, up popped Lattimer with an article in the Journal of the American Medical Association asserting that Kennedy's back brace had

propped him up after he was first hit, and had made him an easy target. Now this would be bad enough, but Lattimer actually made the mistake of asserting that a second coincidence also contributed to Kennedy's death--that the misalignment of Oswald's scope had coincidentally compensated for the curve in the road, so that all Oswald had to do was fire at Kennedy, and the bullet would hit him in this exact location, even though he'd moved several feet down the road, and inches to the right.

Well, this gives up the game, and reveals Lattimer to be more theorist than scientist. This misleading proposition was first offered by FBI agent Robert Frazier during his Warren Commission testimony. Perhaps Frazier was thinking of the tests undertaken AFTER he'd sighted in the scope and brought the scope and rifle in the best alignment possible without adding shims to the scope mount. These tests revealed that the rifle fired 4 inches high and 1 to the right at 100 yards. Such a misalignment would indeed allow someone to fire at JFK when he was on Elm without having to worry about a lead, should he know ahead of time the degree of this misalignment. BUT THIS WAS NOT THE MISALIGNMENT OF THE SCOPE WHEN FIRST TESTED BY THE FBI. Frazier testified that the rifle, when first tested by the FBI, fired 4 inches high and 1 to the right at ONLY 15 YARDS, and that these shots all landed within the size of a dime, and that this indicated the rifle had not recently been adjusted. Well, such a misalignment would be of no help at all to a sniper; it would force a sniper to shoot BEHIND Kennedy in order to hit him as he was moving away. It follows then that Frazier's assertion the misalignment worked to the sniper's advantage was either a total brainfart on his part or a deliberate deception, and that Lattimer's repetition of this nonsense was more of the same, or perhaps a reflection that he took his job as Hoover's urologist a bit more seriously than anyone could reasonably have imagined.

And from there things just get worse. An October 24, 1968 article in the New York Post reflects that Lattimer had started giving talks on the feasibility of the single-bullet theory to his fellow physicians, and that he believed at so early a date, long before the Zapruder film was widely available, that the first shot *"hit a tree branch and never reached the President's car,"* and that the second *"struck the back of President Kennedy's neck, went through his voice box, and 'came out at the knot of his tie,'"* before striking Governor Connally. This marks him once again as more theorist than scientist. The eyewitnesses overwhelmingly claimed the President reacted to the first shot. The autopsy report fails to note damage to the voice box, or larynx. The drawings created by the autopsy doctors for the Warren Commission, moreover, depicted the bullet exiting below Kennedy's voice box or larynx, on his trachea, or windpipe. Lattimer's assertion that the first bullet hit a tree branch and the second bullet went through Kennedy's voice box, then, can only be seen as his ignoring the findings of the Warren Commission and re-interpreting the shooting sequence and bullet's angle of descent within the neck...for reasons all his own.

In any event, following his inspection of the autopsy materials on January 9, 1972, Lattimer told the New York Times that the photographs and x-rays *"eliminate any doubt completely"* about the validity of the Warren Commission's conclusions and that Oswald fired all the shots. He said further that the photos and x-rays demonstrate that the back wound was actually higher than the Commission reported (yes, that's right, even higher *than on the Rydberg drawings*) and that the angle of descent within the neck was far greater. He said the wound was so high in comparison to the throat wound, in fact, that in order for the throat wound to have been an entrance wound as so many believed, someone would have to have been firing from the floor of the limousine in front of Kennedy. Lattimer didn't seem to understand that this comment meant conversely that the bullet exiting the neck should have hit the floor and not Connally, and that this statement was therefore an argument against the single-bullet theory he was so adamantly defending.

Perhaps the man had suffered some sort of meltdown. On January 10, the next day, he was interviewed by John Nebel on WNBC. and admitted that after reading the Warren report he *"still had considerable*

doubts, and uh these doubts revolved about the such items as the trajectory of the bullet that went through President Kennedy's neck" and asserted that the Warren Commission drawing for this trajectory, CE 385, "makes the bullet track look as if it's much parallel with the ground. And that worried me a good deal, and, uh, I know that it's little things like this that combine to worry you about the whole massive text." But that was in the past. Lattimer told Nebel that upon viewing the autopsy photos "I was interested to observe that the rear hole, which is clearly a wound of entrance, is quite far above the front hole, which is presumed to be a wound of exit." As it would later be shown that the bullet entrance on CE 385 was in fact two inches too high, and that the rear wound Lattimer claimed was "far above" the front wound was in reality either below or at the same level as the front wound, it's clear that Lattimer, perhaps overcome with "worry," simply reported what he wanted to see, or felt others should believe he saw.

But this was not the end of Lattimer's trail of "whoa!" For Lattimer's May 1972 Resident and Staff Physician article on his trip to the archives he created a drawing depicting his interpretation of Kennedy's back wound, and the path of the bullet purportedly entering Kennedy's back and exiting his throat. This drawing was staggeringly, and shockingly, inaccurate. While acknowledging in a February 14, 1972 letter to Robert Biecher found in the Weisberg Archives that *"the wound on the back of the neck"* which he'd discussed with the press *"was certainly the one 14 cm. below the right mastoid process,"* and while acknowledging in the text of his article that the back wound was 5 cm below the neck crease *"at the juncture of neck and back,"* Lattimer inexplicably depicts the wound in his drawing about 5 cm below the mastoid process, *at the juncture of neck and back*. Equally strange, in order to explain the bruise on Kennedy's lung, Lattimer depicts the upper dome of the lung adjacent to the bullet path descending Kennedy's neck...and, in the process, lifts the dome of the lung into the neck, above the knot on Kennedy's tie. Even more absurd, to account for the holes in Kennedy's clothing being so much lower on Kennedy's back than Lattimer's proposed location for the back wound, Lattimer bunches up a gigantic fold of clothing on the back of Kennedy's neck in the drawing. No such fold, of course, can be seen on any of the assassination films.

Now that's already way too much, but Lattimer's drawing also has the bullet path descending 27 degrees through Kennedy's body, which, since the limousine was on a downhill slope of 3 degrees, means he believed the bullet was descending 30 degrees from the horizontal plane. Since he eventually claimed the bullet came from the sniper's nest at Z-224, when the angle of descent from the sniper's nest was 21 degrees, this suggests he believed Kennedy was leaning 9 degrees backwards when struck.

From there Lattimer's story gets even more absurd, and disturbing. Not content with the round of extended articles he was able to publish in the aftermath of his visit to the archives, he put together a 24-page article for the November 1974 issue of Medical Times. While he spent much of this article, devoted entirely the *"Kennedy-Connally One Bullet Theory,"* discussing Governor Connally's wounds and the wound ballistics of Mannlicher-Carcano ammunition, he did spend just enough time discussing Kennedy's wounds to slip in one heckuva lie. His *"Reconstruction of What Happened"* entailed: *"The 6.5 mm bullet, fired from above and behind the President, had entered the top of the prominent roll of soft tissue across the back of President Kennedy's neck..."* Yikes. As we have seen, the bullet wound was not on the back of the neck, let alone at the top of a prominent roll of soft tissue across the back of the neck.

Yes, there was apparently no belief too absurd, or no lie too great, for Lattimer to have shied from, should it have suggested Oswald's sole guilt. On May 7, 1975 he was interviewed by the Rockefeller Commission, and repeated much of what he'd told the New York Times. He went even further, however, and told them that inspecting Kennedy's brain would be unnecessary, seeing as Dr. Humes had been *"particularly thorough about finding any foreign material in the brain"* and that *"we have surprisingly good x-rays of it and surprisingly good photographs of it."* He claimed further that this

provided him with a “*reasonable basis for knowing what the situation in the brain was, relative, at least, to the direction of the missiles.*” He ignored that he'd previously concluded that the ever-thorough Humes had incorrectly identified the entrance of the bullet on the back of Kennedy's head, and had been off by four inches.

In November, 1976, moreover, as a response to Congressman Thomas Downing's public declaration that the Zapruder film had convinced him Kennedy was shot from the front, Lattimer popped up yet again. Somehow, somehow, he just so happened to make an appearance before a luncheon of the National Press Club, and show them films of experiments he'd performed by shooting bullets into animal skulls (no doubt, your typical luncheon entertainment). Not surprisingly, these tests (later debunked by Wallace Milam) showed the skulls flying back in the direction of the bullet, and supposedly undercut Downing's claims the rearward movement of Kennedy's head suggested the fatal shot came from the front.

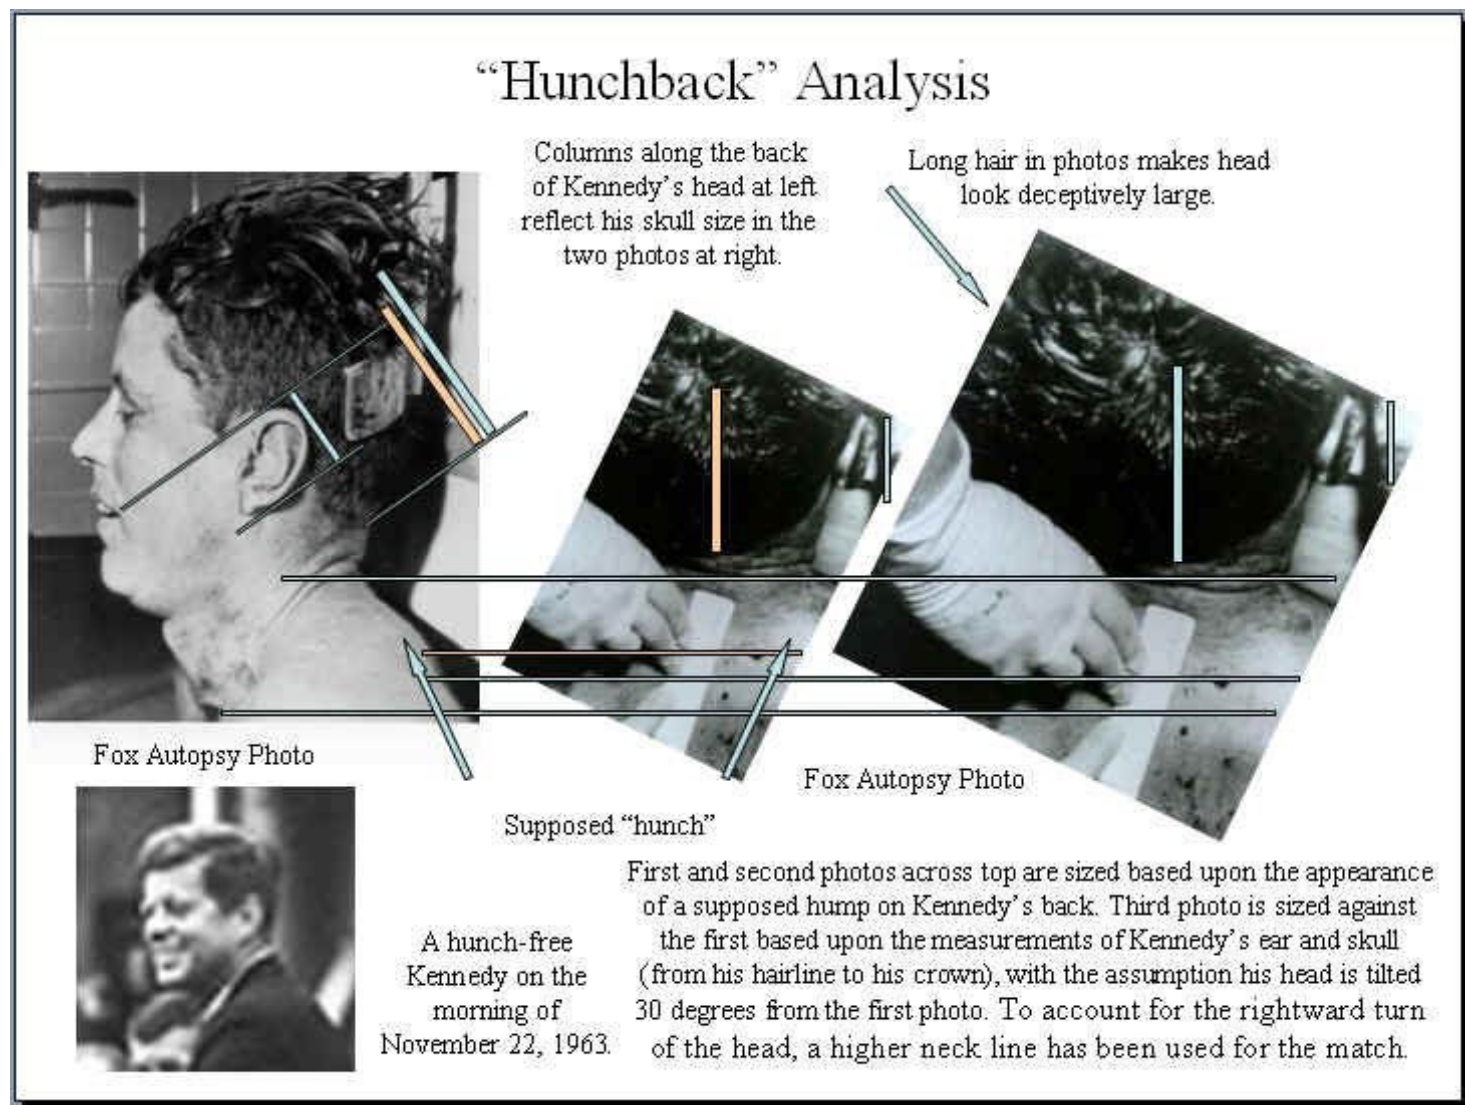

Evidently, these tests convinced Lattimer he'd solved everything and that no further investigation was necessary, because on March 22, 1977, an article carried by the Ridder News Service reported that Lattimer had told some 300 members of the Fayette County Medical Society that “*Reviving the investigation of President Kennedy's death would be expensive and unnecessary.*” Now, why would he do this? Was he concerned that a new investigation would reveal that he had been untruthful when he asserted that the back wound was even higher than in the Rydberg drawings? Or was he really that confident? If he was really that confident, well, then, he had NO reason to be, as other statements attributed to him in this article reveal that he was simply making stuff up in order to justify shutting down the investigation already underway.

According to the article Lattimer described the shots as follows: “*The first shot probably struck the branch of a tree and was deflected to the pavement where it was absorbed...Five seconds later, with the limousine now only 190 feet away from Oswald's position, the second shot was fired. It hit the president in the back of the neck, passed through it, and entered Gov. John Connally's side...Five seconds later, the third shot was fired from a striking distance of about 250 feet, striking Kennedy in the back of the head...*” Well, wait a second! If the first shot was fired five seconds before the single-bullet shot, which was at the latest frame 224, then it was fired around frame 131, TWO seconds before any of the trees in front of the school book depository would interfere with a shot from the sniper's nest. Could Lattimer really be proposing that Oswald led the limousine by 30 feet or more?

Okay. Okay. It seems possible Lattimer misspoke about the five seconds... A 2-27-78 HSCA Contact Report on a conversation with Lattimer, after all, reports that by then he was postulating that “*the first shot occurred at Zapruder frame (Z) 166 and was a miss.*” But it gets worse. The 1977 article quotes Lattimer as discussing Oswald and his motivation as follows: “*After returning to this country, Oswald began a propaganda campaign for Cuban revolutionaries in New Orleans and eventually ended up in Dallas. There, three weeks before he shot the President, he attempted to kill a retired Army general. He learned from having tried to shoot the general that it would take more than one shot to kill Kennedy...If he'd been assigned to shoot Kennedy, he wouldn't have been firing at someone else just three weeks before.*”

The omissions and mistakes in Lattimer's scenario are more revealing than what he gets correct. First of all, the Fair Play for Cuba Committee, with whom Oswald was affiliated in New Orleans, was not a violent or revolutionary organization, as implied by Lattimer. Second of all, Lattimer omits that this “*retired general,*” General Edwin Walker, was forced out of the military by Kennedy for his reactionary and racist political activities and that there is reason to doubt that anyone contemplating his assassination would kill Kennedy instead. Third, the attempt on Walker did not take place three weeks before Kennedy's assassination, as asserted by Lattimer, but on April 10, 1963, more than 7 months before! Needless to say, Lattimer's understanding of Oswald and his background was as wildly

inaccurate as his strange belief the back wound was further above the throat wound than depicted in the Rydberg drawings.

"Hunchback" Analysis

To be fair to Dr. Lattimer, I think I've located the source of some of his confusion. I believe this same confusion contributed to the Clark Panel's errors. When one compares the left lateral autopsy photo, which shows the location of the throat wound, with the photographs of the back wound, and focuses on a rounded hump of flesh on Kennedy's shoulder, one can easily imagine that this shape is a "hunch" of some sort and that the bullet entrance is in the middle of this "hunch." Since this "hunch" in the back wound photo is clearly higher on the body than the throat wound in the left lateral photo, moreover, one can take the next step and conclude that this means the bullet traveled downwards in the body, and that the single-bullet theory is supported by the photographs. But when one relies on hunches alone one will often be wrong.

Some of whom have noticed this "hunch," including Drs Lattimer and Baden, have even went so far as to speculate on its origins. Dr. Lattimer, on the day after he'd first viewed the autopsy materials in 1972,

told NBC that Kennedy's body had a *"slight thickening of the tissues over the shoulders, which is typical of people taking cortisone."* In his paper on this inspection, presented in the May 1972 issue of Resident and Staff Physician, moreover, he expanded on this theme, and insisted that *"the tissues at the back of his neck were more prominent than those of most people. This was possibly due partly to his manner of holding his shoulders very high, so that a 'roll' of tissue was produced across the back of his neck and also perhaps because he was taking the cortisone derivative which may have caused a slightly greater than normal thickening of these tissues."*

To Lattimer, this "thickening" seemed somehow significant, and a key to understanding the assassination. By 1975, he was telling those questioning the single bullet theory trajectory, such as researcher Emory Brown, that *"what you do not realize is that he (Kennedy) had an unusual roll of muscle tissue across the back of his neck, possibly related to the adrenal hormones he had been taking for years."* This "possibly," moreover, soon dissolved away. In time, Lattimer began asserting as fact the obvious nonsense that Kennedy had grown a hunch on his back from the steroids he'd taken to combat his Addison's disease, and that this hunch explained how the holes on Kennedy's clothing 5 inches below the top of his collar could overlay a wound at the level of his chin. Lattimer, and those who swallowed his nonsense, like Baden, failed to realize that the left lateral autopsy photo which appears to portray a slight hunch was taken with Kennedy lying flat on his back, with his shoulders rolled outwards, pushing the flesh of his back upwards. They failed to see as well that photos of Kennedy taken on the day of the assassination prove there was no such hunch...

When one starts measuring their whole argument falls to pieces. The ruler in the un-cropped back photo appears to be about 37 mm wide, or 1.46 inches. From this measurement one can see how the Clark Panel came up with their determination that the back wound was 5.5 cm (a little over 2 inches) below the fold along the back of the neck. When one matches the "hunches" one can see that the distance from the fold to the throat wound on the lateral photo approximates the 9 cm that the Clark Panel proposed. Why no one on the Clark Panel decided to measure this distance on their own bodies is another question. I'm 6'4" and when one measures 9 cm below the fold across the back of my neck one reaches the level of my sternum, far below the level of the wound in Kennedy's throat. Experienced doctors should have known better, or at least have been suspicious enough about the measurement to take a second look.

For when one takes a second look, one realizes that in order for this "hunch" to match in each photo, and in order for the neck lines to match, the photo of the back wound must be greatly reduced compared to the lateral photograph. A quick comparison of Kennedy's ears in the two photos proves that this is true. Should one use the ruler in the back wound photo to measure the size of Kennedy's head in the lateral photo (when the hunches are made to match) one can approximate that the vertical height of Kennedy's skull was 11.5 inches. When the ears are made to match, however, this distance is only 9.8 inches. My skull, even with my mouth slightly opened, is only 9 ¼ vertical inches from the level of my slightly opened jaw to the highest point. It's hard to believe that Kennedy's skull would be 24% longer than my own. (Fatter maybe, longer no.) When one takes the time to match the sizes of the ears and body proportions, therefore, one can see that the "hunch" was largely an illusion based on Kennedy's body position, and that the back wound in the photograph was actually 25% closer to the level of Kennedy's throat wound than it appears when the hunches are made to match.

When one takes notice of Kennedy's body position in the back wound photo, and sees that he's laying on his left side with his head turned to his right, moreover, it should be apparent that the back wound is, in fact, at the same level as the throat wound (when the body is in the anatomic position).

Should one refuse to believe that the back wound location is distorted and lifted upwards in both the back wound photo and lateral photo, moreover, one need only re-read the autopsy report. The back wound was reportedly 14 cm below the bottom tip of Kennedy's mastoid--which is approximately at

the level of the bottom of his ear. If the back wound was REALLY 5.5 cm below the transverse fold in Kennedy's neck, when the body was in the anatomic position, as concluded by the Clark Panel, it means the transverse fold was 8.5 cm below the mastoid. And this simply isn't true. There is no way that anyone can honestly believe that the transverse fold on the back of Kennedy's neck in the lateral photo is more than 50% FURTHER away from the bottom tip of the right mastoid than the supposed entrance location in the back hump. This makes it clear that either 1) the autopsists were incorrect, and claimed a wound roughly 8-9 cm below the bottom tip of the mastoid was 14 cm below the bottom tip of the mastoid, or 2) Kennedy's position in the back wound photo and/or the lateral photo make the wound appear to be higher on the body than it would be in the anatomic position.

This second option seems obvious.

Up the Neck

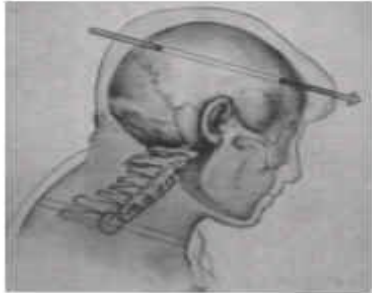

Above: Dr. Michael Baden points out the bullet entrance on the back of Kennedy's jacket to the HSCA, 9-7-78.

Blue line added to demonstrate that the slits on Kennedy's shirt were higher than the bullet entrance on the back of his jacket.

At right: HSCA Exhibit F-65, from the testimony of Dr. Baden, demonstrating the pathology panel's conclusion that the bullet entered at the first thoracic vertebrae and traveled upwards in relation to the vertebrae.

Above: Dr. Michael Baden inspects the slits on Kennedy's shirt before the HSCA, 9-7-78.

Up the Neck

But you don't have to trust me on this. My finding that the back wound was at the same vertical level in Kennedy's body as the throat wound was shared by the HSCA Forensic Pathology Panel, comprising nine of the top pathologists in the country. No, that's not quite true. The forensic pathology panel's report, released in 1979, actually asserts that the bullet fired from the sniper's nest at least 20 degrees above Kennedy passed through his body in a slightly *upwards* trajectory.

When one looks at the testimony of Dr. Michael Baden before the committee, and compares the bullet entrance on the back of Kennedy's clothing with its purported exit on Kennedy's collar, one can begin to see why they came to this conclusion. The path is clearly upwards. If you're surprised by this it's no wonder. While many TV shows present the single-bullet theories of Dr. Lattimer, Gerald Posner, and Dale Myers as if they are the official government theory, the theories of these men are actually at odds with both the Warren Commission and HSCA interpretations of the wounds, trajectories, and shot

sequences.

That rant having passed, I must admit that I also have problems with the HSCA's conclusions. To begin with, it seems clear to me that the HSCA Forensic Pathology Panel (FPP) was indeed mistaken in their analysis of the back wound. Not by much, mind you. While they were correct to note that the abrasion collar in the back wound photo was on the lower half of the entrance wound, and that this indicated the bullet was heading upwards along the skin, they were mistaken to say "the direction of the missile in the body on initial penetration was slightly upward, inasmuch as the lower margin of the skin is abraded in an upward direction. Furthermore, the wound beneath the skin appears to be tunneled from below upward." As the upper back is slanted towards the neck, *any* bullet striking the upper back at a downwards angle less than the angle of the slant would leave a mark along the skin reflecting an upwards trajectory. The abrasion ring noted by the FPP, therefore, could have represented a bullet heading downwards within the body as well as upwards.

Unfortunately, this is not the only point on which we disagree. Not by a long shot.

T-3 or Not T-3?

But before we go on to complain about the horrendous mistakes/deceptions of the HSCA, let me congratulate them for getting at least one thing right. They resolved the location of Kennedy's back wound! In both the testimony of Dr. Baden and in their exhibits they made it clear they believed the bullet entered at the level of the first thoracic vertebra, roughly 2 inches lower than the entrance depicted in the Warren Commission's drawings.

While my acceptance that the bullet entered at T-1 has led to at least one conspiracy theorist trumpeting

that I'm intellectually dishonest, it would be intellectually dishonest for me to pretend I disagree with the HSCA on this point. I have looked through dozens of anatomy books and measured dozens of medical drawings, and am convinced that T-3, where many conspiracy theorists place the wound, is an inch or two lower than the back wound apparent in the photos. While some point out that Kennedy's personal physician, Dr. George Burkley, placed the wound at T-3 on Kennedy's death certificate, they fail to appreciate that Burkley was far from certain about this and had, in fact, stated "a second wound occurred in the posterior back at *about* the level of the third thoracic vertebra." They also fail to appreciate that there is no indication Burkley did anything more than glimpse at Kennedy's body and did anything to establish the back wound's location beyond glimpsing at the confusing face sheet.

While some note a small mark in the back wound photo near the T-3 level, and propose that this mark was the "real" back wound, I find this also has little foundation, as the size of this mark (roughly 3 mm x 4 mm, or 12 mm) is less than 1/2 the size of the bullet wound measured at autopsy (7 mm x 4 mm, or 28 mm), and the wound at T-1 is, no surprise, a much better fit (roughly 8 mm x 5 mm).

And, FWIW, I am far from alone in my rejection of the claim the back wound on the face sheet and photos was at T-3. While Dr. David Mantik and myself have many disagreements about the Kennedy assassination medical evidence, this isn't one of them. In his 2011 review of Don Thomas' *Hear No Evil*, available on the CTKA website, Mantik made this more than clear, stating that "both the autopsy photo (Galanor 1998, Document 12) and the autopsy diagram (the descriptive sheet—see Galanor 1998, Document 5) place the wound...close to the level of T1 or T2." He thereby adopted the T1 location as the location for the purposes of discussion, a discussion which led him to reject the single-bullet theory even if the wound was at T1.

Sometimes we think alike...

T-1 is Enough

Above: a photo of a skeleton. Note that the bullet trajectory depicted by the HSCA medical panel in Exhibit 65, represented by the blue arrow, leads beneath the first rib. Also note that if Kennedy was leaning forward when struck, as purported, and the bullet traveled along the path of the red arrow, as purported, the first rib would be in its path, and would not be spared.

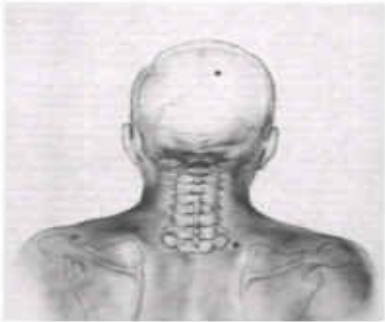

T-1 is Enough

Now, it's not as if I don't understand the sentiments of those wanting to believe the bullet entered at T-3. If the bullet entered as low as the third thoracic vertebra there would be no way it could avoid piercing Kennedy's lung en route to its purported exit in his throat. The single-bullet theory would be so outlandish not even Arlen Specter would lay claim to it. But I feel that an entry at T-1 is nearly as damaging.

You see, from poring through anatomy books, trying to figure out the proper level of the back wound entrance, I came to understand that the T-1 level of the spine corresponds to the level of the first rib. This is extremely problematic for the single-bullet theory in that, if Kennedy was sitting fairly upright, a bullet entering at T-1 as depicted in the HSCA exhibits, including Exhibit F-65, would dive down below T-1, and into Kennedy's lung. According to the autopsy, which held that nothing pierced Kennedy's lung, this did not happen. An entrance at T-1 is also problematic in that, even if Kennedy was bent forward to such an extent that the bullet entering his back would head straight for his throat, the first rib would be right in its way. As the "magic bullet," CE 399, had been avoiding sweets and had a decidedly unblemished nose, this also did not happen.

So how did the HSCA solve this dilemma? Did they accept what would seem obvious? That the lynchpin of the single-assassin conclusion, the single-bullet theory, made little sense

The HSCA Single Bullet Theory

Above: HSCA Figure 24

Above and at left: HSCA Exhibit F-46, Kennedy's supposed inclination at Z-190.

At left: Z-188, 1/9 of a second before Z-190, shows Kennedy to be sitting upright. (Z-190 is too blurred).

Middle, top: Kennedy photo demonstrating that the back wound was at the approximate level of Kennedy's tie. Red star represents the location of the throat wound as per the Clark Panel's measurements.

The HSCA Single Bullet Theory

If one were told in 1976 that the HSCA was going to determine that the Warren Commission and Clark panel were wrong, and that the back wound was at the same level as or even slightly *below* the wound in Kennedy's throat, one would rightly have concluded that the single-bullet theory had been debunked. Instead, when the HSCA published its final report in 1979, the committee concluded that the theory was still valid. To do this, they proposed that Kennedy was leaning a lot further forward than had previously been presumed.

This was doubly surprising since the HSCA had also decided that Kennedy was first hit at Zapruder frame 190, at a point when he is clearly sitting up in his seat. The Warren Commission, we should remember, concluded he was hit somewhere between frames 210-225 of the Zapruder film, when he was behind the Stemmons Freeway sign, and his forward lean could not precisely be determined. Equally troubling, by moving up the proposed moment of impact, the HSCA put Kennedy closer to the Texas School Book Depository at the time he was shot, and made the angle of descent for the "magic bullet" that much sharper. A quick comparison of Kennedy's position in Zapruder frame 188, 1/9 of a second before the supposed impact, to Kennedy's position in HSCA Exhibit F-46, a drawing of Kennedy leaning forward to the degree required for a non-deflected bullet to pass through his back and neck and then hit Governor Connally, demonstrates that Kennedy was not in the proper position to receive his wounds as proposed.

This forces one to wonder if the drawing was simply in error, or if the doctors truly believed the single bullet-theory they were depicting. Some quick measurements show that Kennedy's neck is bent forward 31 degrees in the drawing, and that the arrow descends at 27 degrees. A bullet on such a trajectory would *ascend* 4 degrees through Kennedy's body. As this matches the pathology panel's analysis of the back wound, it seems clear, then, that they expended some effort on the drawing, and were not just guessing. Which makes it hard to explain why the arrow in the drawing descends at 27 degrees. The angle of descent from the sniper's nest at frame 190, when the HSCA proposed Kennedy was first wounded, was only 24 degrees.

A careful reading of the panel's report offers a partial explanation for these errors. It indicates that F-46 was only supposed to demonstrate the relationship between Kennedy's wounds, and that determining the actual position of Kennedy at the moment of the shot and the trajectory of the bullet was the responsibility of the trajectory panel. This sets off my bullshit detector.

The 9-7-78 testimony of Dr. Cyril Wecht only adds to my concern. About the single-bullet theory, Wecht testified: *"How does a bullet that is moving slightly upward in the President proceed then to move downward 25 degrees in John Connally. This is what I cannot understand. My colleagues on the panel are aware of this. We discussed it, and what we keep coming back to is, 'well, don't know how the two men were seated in relationship to each other.' I don't care what happened behind the Stemmons Freeway sign, there is no way in the world that they can put that together, and likewise on the horizontal plane, the bullet, please keep in mind, entered in the President's right back, I agree, exited in the anterior midline of the President's neck, I agree, and was moving thence by definition, by known facts, on a straight line from entrance to exit, from right to left. And so with that bullet moving in a leftward fashion, it then somehow made an acute angular turn, came back almost two feet, stopped, made a second turn, and slammed into Gov. John Connally behind the right armpit, referred to medically as the right posterior axillary area. The vertical and horizontal trajectory of this bullet, 399, under the single bullet theory is absolutely unfathomable, indefensible, and incredible."*

Wecht's testimony indicates that some members of the panel supported the theory under the belief the shot was fired when Kennedy and Connally's positions were unclear. Earlier and subsequent statements by four of the panel's leading lights, Dr. Werner Spitz, Dr. James Weston, Dr. Charles Petty, and Dr. Michael Baden prove this to be true, and prove them to have been a bit, shall we say, clueless.

Shortly after he'd first studied the photos and X-rays on behalf the Rockefeller Commission, in a May 25, 1975 appearance on the Lou Gordon Show, Spitz declared that no one could say Kennedy and Connally were not in position to have a single-bullet create all their non-fatal wounds *"since you don't really know what had happened behind the sign when the President's motorcade was behind the sign which is noted on the Zapruder film. Since you don't really know what happened there, that the Governor may have turned around..."* Well, this is strange. Spitz had elsewhere acknowledged that the back wound was below the throat wound but was so clueless he didn't realize that the issue had then become whether or not Kennedy had leaned forward while behind the sign, not whether Connally had turned around.

By 1988, he at least seemed to know that the imaginary act he needed to propose involved President Kennedy, and not the governor. In a 1988 interview on radio station WXYT, Dr. Spitz insisted that we didn't know the position of Kennedy when he was shot because *"The first shot, when Kennedy is hit, is when he is passing behind a road sign which indicates the upcoming freeway and you really don't know when at exactly the point when Kennedy was hit in the shoulder. You think you know because of the echo, but we know very well that the echo follows the sound."* (What echo? What is he talking about?) Spitz then revealed that he--and by extension the entire pathology panel--had never been told that the photography panel had determined Kennedy to have been hit before he went behind the sign. When told that photographs indicate Kennedy was hit before he went behind the sign, he thundered: *"No,*

that's not true. You see him with a distorted face when he comes out from the sign. When he goes behind the sign, he's smiling and waving to the people on the right." (The photography panel had rejected this argument, and had determined that Kennedy was in fact in distress when he went behind the sign.)

Dr. Weston was equally in the dark. After viewing the autopsy materials in 1975, at the request of CBS News, he emerged with a similar attitude as Spitz. According to a November 28, 1975 AP article, published nationwide, Weston claimed that while a better autopsy and a photo of Kennedy when the bullets struck could have helped *"determine the bullet's point of origin,"* the *"president's car is hidden by a roadside sign in the only films of the crucial seconds when he was hit."*

Dr. Petty apparently concurred. While he never said anything, from what I have found, about the shot's impacting while Kennedy was hidden behind the sign in the Zapruder film, he did make some statements suggesting that he believed Kennedy's appearance in the frames when he was not behind the sign incompatible with the single-bullet theory. In his 1978 HSCA testimony, taken right after Dr. Wecht's testimony (perhaps to dull its impact), he defended the single-bullet theory's viability. After acknowledging that he believed the bullet trajectory to have been upward in Kennedy's body, he asserted, *"But the President was not upright at the time he was shot, he was certainly not in the anatomic position."* Shrewdly, he failed to mention when this was. If there had been a frame in which Kennedy had been leaning forward enough to support Petty's claim, one can only assume, Petty would have mentioned it.

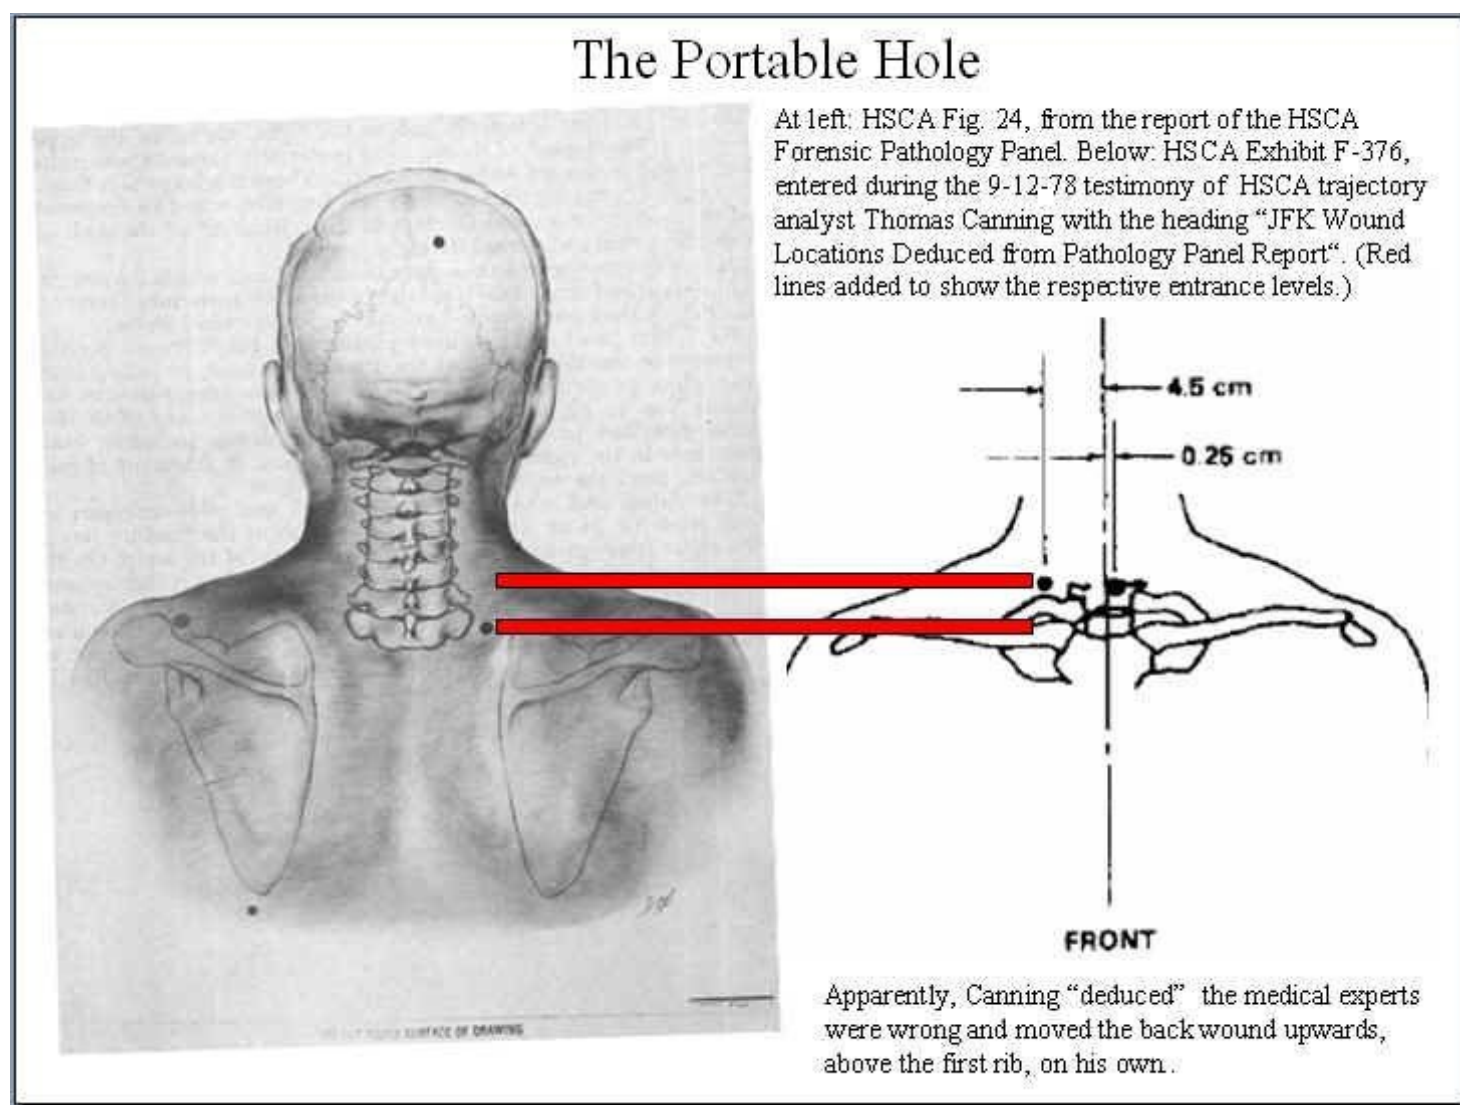

That Petty had problems locating a frame in which Kennedy and Connally's wounds were in alignment is supported, moreover, by his statements a few moments later. When discussing the horizontal trajectory, and Dr. Wecht's claim Kennedy's throat wound was not aligned with Connally's back wound for a shot from the sniper's nest, Petty asserted *"the apparent relative positions of the President and the Governor are somewhat misleading, that is, that one cannot determine by looking at a flat two dimensional view of one side of the limousine and the contained individuals precisely what relationship they had one to another."* By saying the apparent relative positions of the two men in the film were somewhat misleading, of course, Petty was as much as admitting that the film suggested, even to him, that Kennedy and Connally were never aligned in a manner supporting that they were struck by one bullet as proposed. One can only assume, then, that he, as his colleagues, felt comfortable with the assumption they were hit when their exact positions could not be observed.

In 2003, at a conference sponsored by Dr. Wecht, Dr. Baden, the pathology panel's spokesman, revealed himself to be yet another more comfortable with the blinders on. When asked to point out the moment in the Zapruder film that Kennedy is first hit, he asserted: *"My impression is that he (Kennedy) is shot behind the Stemmons Freeway sign; that's why we don't see it."* When Wecht correctly pointed out that Kennedy was only behind the sign for .9 seconds, hardly enough to lean forward and then back, Baden then explained: *"I think Kennedy's neck has to be leaning forward a little bit, waving to somebody as you do, and that would put him in position."*

Spitz, Weston, Petty, and Baden's supposition that Kennedy was hit while behind the sign in the film, and/or unscientific belief one couldn't accurately determine the relative positions of Kennedy and Connally in the limo, is inconsistent with the HSCA's findings. This, then, raises the possibility that someone (perhaps Robert Blakey) knew the Zapruder film never showed Kennedy to be in a position to receive his wounds as proposed, and had sought out someone less concerned with his reputation to claim just the opposite. That way, when confronted with the fact that Kennedy never was in such position, the doctors could always raise their hands and do their best Freddie Prinze impression, protesting, "It's not my job, mang!"

Well, then whose job was it? As the job was virtually impossible, they gave it to another 70's television

icon, a man who regularly did the impossible: Mr. Phelps.

The Portable Hole

No, not quite Mr. Phelps of Mission Impossible fame, but close. They called NASA, and NASA sent them a trajectory expert named Thomas Canning. To their eternal shame, the HSCA then gave Canning the ability to move the wounds as he saw fit, in order to better align the trajectories and, one can only assume, make sure they all pointed back to the sniper's nest.

Since this last assertion is really hard to swallow, let me quote the part of the HSCA report that makes this clear. On page 33 of HSCA Appendix Vol. 6, in the report on the trajectory analysis, when describing the procedures used to establish the bullet trajectories, it declares "The Forensic Pathology Panel was responsible for providing, to the extent possible, the precise locations of the wounds sustained by Kennedy and Connally." But there is an asterisk after this. At the bottom of the page, in an explanation of this asterisk, the report acknowledges "While the Forensic Pathology Panel did provide this information, *the actual measurements related to wound locations were determined by the NASA scientist who was responsible for supervising the trajectory project.* He was in frequent consultation with members of the Forensic Pathology Panel and with forensic anthropologists from both the FAA's Civil Aeromedical Institute, and the Smithsonian Institute." How frequent he consulted with these

unidentified panel members isn't stated. But if any of the members disagreed with Baden's testimony regarding the back wound location, and disagreed with the exhibits he presented to the committee, they were free to testify and voice their dissent. None did.

In any case, under the encouragement of others or not, when Canning testified on 9-12-78, it became clear he'd taken liberties with the wound locations. Despite the fact that Dr. Baden had testified but 5 days before, and had presented a number of exhibits, including exhibits 46, 58, and 65, depicting the bullet entering at the T-1 level, Canning boldly dragged Exhibit 376, which showed this same bullet entering considerably above the T-1 level and the problematic first rib, before the committee.

Much as a character on the old Mission: Impossible TV series, or a cartoon character, or a decent Dungeons and Dragons player, he had availed himself of a portable hole.

Apparently, his conscience had fallen down that hole. Although the wound locations in his exhibits were undoubtedly at odds with the wound locations described in the pathology panel's report, he had the cojones to entitle Exhibit 376 "JFK Wound Locations Deduced from Pathology Panel Report."

Now, in the House of Representatives they might call this creative interpretation., but in my house, we call it LYING.

And there's reason, moreover, to think others put Canning up to it. Not doctors, but the HSCA staff... HSCA Deputy Chief Counsel Gary Cornwell, in his 1998 book Real Answers, makes a bizarre claim that shows that Canning was far from alone in misrepresenting the back wound location as interpreted by the pathology panel. Here it is: *"In the end, when the errors committed by the original clinical pathologists as set out in the Warren Commission Report are corrected, and the Warren Commission's alleged 'precision' of wound location and bullet trajectories are recognized as actually being quite imprecise, there is nothing necessarily 'magical' about the path of the single bullet."*

Feel free to read that again... Yep, Cornwell was claiming that the HSCA's being more 'precise' than the Warren Commission in its determination of the wound locations made the single-bullet theory less magical, and therefore more probable. What a crock! There isn't a soul alive--outside perhaps Cornwell--who thinks the HSCA pathology panel's re-interpreting the back wound location at a point 2 inches lower on Kennedy's back--at a point actually below the throat wound--made it more believable these wounds were connected by the path of a bullet sharply descending from above, and entering from behind.

Real Answers? Get real!

Blue lines in the photo added to help
measure the distance from the spine. Each
line equals 2 inches or 5 cm on the ruler.

Why did Thomas Canning present
evidence On 9-12-78 that
had been discredited 5 days earlier?

Why is the back wound in F-58
50% further from the spine than in
the autopsy photo at left?

Cunning Canning and Bad Bad Baden

But the incorrect placement of the back wound in F-376 is just the tip of the iceberg. For its lateral depiction of the single-bullet theory in Exhibit F-376, the trajectory panel placed the back wound on the back of the neck in nearly the exact location used in Warren Commission Exhibit CE 385. F-376, it bears repeating, was presented to the committee by Thomas Canning five days after Dr. Baden testified that the back wound in CE 385 was two inches higher than its actual location. Not stated previously, however, is that Dr. Baden presented CE 385 into evidence as HSCA Exhibit F-47. Canning had thereby presented an exhibit to the commission that confirmed the wound location in an exhibit already presented to the committee as an example of an inaccurate exhibit. Even worse, Canning claimed the wound locations in his own exhibit had come from the panel claiming the wound locations in F-47 were inaccurate! Now, I don't know which is more shocking--that Canning would misrepresent the evidence in so brazen a manner or that no one on the committee noticed that his exhibits directly contradicted the more credible testimony of the forensic pathology panel.

The forensic pathology panel's exhibits, unfortunately, weren't much better. On Exhibit F-58, for instance, the back wound was shifted slightly further from the spine than was indicated by the autopsy photos or by the measurements. The entrance was measured as being 4.5 cm from the mid-line of Kennedy's spine. If the entrance on this drawing is 4.5 cm from his midline, however, then Kennedy measured only 13.6 cm to his shoulder. The Clark Panel measured 16 cm to his shoulder, which is as one should expect for a man of his size. If he was indeed 16 cm to his shoulder, the wound in exhibit F-58 is 5.4 cm from his spine, not 4.5. In addition, if one uses the width of the ruler in the photo (which appears to be a centimeter ruler), 37 mm or 1.46 inches, to measure the distance from Kennedy's spine to the bullet entrance, one finds the entrance is approximately 3.9 cm. from his spine, not 4.5. If the

entrance was really 3.9 cm from the spine but presented in F-58 as 5.4 cm from the spine, it follows that the wound was moved almost 40% further from the spine.

This convenient movement of the back wound, courtesy Dr. Baden, who worked on the drawings with medical illustrator Ida Dox, allowed the bullet path to seem outside the width of Kennedy's spine. That this entrance was at the level of the first rib, and the first rib was not depicted, on this or on any other of the exhibits created for the medical panel, is also suspicious.

But Canning was not to be outdone. Canning held that Kennedy was leaning forward 14 degrees compared to the street when he received the back wound and that a proper analysis of his wounds and a proper analysis of his body position at frame 190 of the Zapruder film indicated the bullet was *descending* 4 degrees as it passed through his body. This, of course, directly contradicted the professional opinions of the doctors, who said the bullet passed upwards in his body. Canning held, furthermore, that when one added in the 3 degree slope of the street to the 14 of the forward lean and the 4 of the descent within the body one could project back 21 degrees from the point of impact to establish the location of the shooter. Not surprisingly, he said this was just below the sniper's nest. By deciding that Kennedy was leaning forward 14 degrees from the street and then adding the slope of the street on top of it, of course, Canning had testified that Kennedy was leaning forward 17 degrees from vertical at frame Z-190. This was far less than the 31 degrees offered by the forensic pathology panel but was still far more than was evident in the Zapruder film.

If you're having trouble grasping this, it's no wonder. There were two interpretations of Kennedy's wounds and body position put forth in major disagreement with each other. One interpretation came from nine prominent doctors and presented Kennedy leaning forward 31 degrees *before* he was shot, and the other interpretation came from a man with *no medico-legal background whatsoever*, who re-arranged the wounds and re-positioned the body to come up with something more acceptable to the committee.

That Canning's report was a confusing mess is easily demonstrated. When depicting Kennedy's wound locations he presents Figure II-13, which is the same as the anterior view of Exhibit F-376 above. This depicts a bullet entrance above Kennedy's first rib, and an exit slightly below it just above the level of the first rib. Amazingly, however, in the text of the report he tells a different story. When discussing the back wound, he writes "the back wound was located at a point 4.4 cm to the right of and 1.1 cm above Kennedy's neck wound at the time of the shot. The bullet was moving from right to left by 18 degrees and downward by 4 degrees relative to Kennedy if he were sitting erect". When discussing the single-bullet theory, he explains further "Kennedy's neck wound was 1.1 cm below the first thoracic vertebra." What? Is it really possible that Canning didn't know that the first rib was at the level of the first thoracic vertebra? Why else would he depict the bullet entrance above the rib on the drawing, and then admit it was actually at the same level as the rib in the text? And why else would he depict the exit just above the level of this rib in the drawing, and then claim it was 1.1 cm below this level in the text? Someone was pulling a fast one, or simply screwing up big time.

Where's Jackie?

When one compares Canning's depiction of the single-bullet theory to the Zapruder film one discovers another reason to doubt not only the single-bullet theory as proposed, but his commitment to the truth. As stated, by moving the single-bullet theory to Z-190 from the Warren Commission's estimation of Z-210—Z-225, the HSCA had not only increased the vertical trajectory from the sniper's nest, but the right to left trajectory of the bullet entering the limo. This forced them to re-assess Connally's position in the limousine. In order to explain how he could be hit in the armpit by a bullet exiting Kennedy's throat, Canning decided Connally was sitting near the middle of the limousine, turned to his right. This contradicted Connally's testimony that after the first shot, he *tried* to turn to his right but couldn't see the President, and was starting to turn to his left when hit. A man in the position Canning proposed for Connally could see the President quite easily when turned to his right, and would never have turned to his left in hopes of a better view.

Upon close inspection, it seems clear that Canning paid little attention to the Zapruder film when preparing this drawing. In the film, not only is Connally closer to the door than depicted in the trajectory drawing, but his torso is turned further to its right. A bullet hitting Connally at the angle determined by Canning, it follows, would probably have pierced his heart, and exited his left side. If Canning had studiously compared the Z-frames to the drawing he would also have noticed that Jacqueline Kennedy is in the film at Connally's left, but that the only way she could be at his left in the drawing would be if she were hanging over the left side of the car. Since a viewing of this sequence reveals she was sitting against the back of her seat, the only logical conclusion to be made is that Connally was closer to the door than depicted.

A photo taken a few minutes before Z-190, but from a similar angle, supports this conclusion. As it

depicts Jackie Kennedy sitting considerably inward from her side of the car, but still outside of Connally, it suggests that Connally was sitting in a similar position in Z-190. If one can look at Canning's exhibit and visualize Connally sliding back to the position depicted in this photo, moreover, then one can see how the backwards trajectory through Kennedy's neck on to the sniper's nest would pivot to his left, right off the face of the school book depository and right onto the face of the Dal-Tex Building.

It gets worse. When one looks closer at the drawing, which was entered into evidence as Exhibit F-144 and re-printed in the final report the next year as Figure II-24, one can see that the line supposedly leading to the sniper's nest actually leads back to the far east corner of the school book depository, approximately 5 feet from the sniper's nest. This means that if Connally was even one inch closer to the door than depicted in the drawing then the rearward projection of his wounds through Kennedy would miss the school book depository altogether and point accusingly back towards the Dal-Tex Building. Although the wound locations and their relative positions within the limousine were purportedly determined independently, and then projected back towards the sniper's location, the incredible coincidence that this trajectory just so happened to point to the corner makes me suspect that the original trajectories did in fact point towards the Dal-Tex Building, and that Canning subsequently moved Connally further and further inwards from the door until the trajectory from his back wound location through Kennedy's neck reached the school book depository. Call me paranoid if you like. But there's nothing about Canning's work for the HSCA that remotely inspires trust.

In fact, it inspires mucho mistrust. Canning's drawing reminds me of an earlier drawing used to support the single-bullet theory. In his 1966 book, *Our Murdered Presidents*, a book supporting the Warren Report and its single-bullet theory, writer Stewart M. Brooks reprinted an early cartoon depiction of the shooting. This Boston Globe cartoon inaccurately depicted the Texas School Book Depository, on the northwest corner of Houston and Elm, in the actual location of the Dal-Tex Building, on the northeast corner of Houston and Elm. Brooks thus misled his readers into believing the Warren Commission's purported single-bullet shot came from directly behind Kennedy and Connally. Now, was this just a dumb mistake?? Or was Brooks deliberately deceiving his readers, knowing full well that the Dal-Tex location was the more "logical" source for a shot striking both men on the right sides of their bodies? Call me paranoid if you like. But I'm not so sure these innocent mistakes are "innocent."

The Smoking Spine?

The Smoking Spine?

The realization that Baden's Exhibit F-58 misrepresented the location of Kennedy's back wound, and moved it further from the spine, led me to wonder just how a bullet entering a back within two inches of the middle of a grown man's spine can exit from the middle of his throat without striking his spine. Since there was NO damage to the nose of the purported magic bullet, the slightest tick of a transverse process destroys the single-bullet theory. Someone needs to show us then how the proposed magic bullet made its way through Kennedy's body without striking any bone. Every time a single-bullet theorist such as Arlen Specter makes an appearance the audience should start chanting "spine... spine..." until he deals with this problem. I'm almost serious.

Now it's not as if Specter, when developing his theory, was unaware of this problem. Pathologists consulted for an 11-24-63 article for the Associated Press had claimed that any bullet entering or exiting near the Adam's Apple would "probably" have "struck the spinal cord." When taking the testimony of Dr. Malcolm Perry in March 1964, moreover, Specter asked Perry about his initial speculation Kennedy's throat wound and head wound were caused by one bullet. To this, Perry replied "Since I observed only two wounds in my cursory examination, it would have necessitated the missile striking probably a bony structure and being deviated in its course in order to account for these two wounds...It required striking the spine." Well, if Dr. Perry thought a bullet entering the middle of Kennedy's throat and exiting the right side of his head might very well have hit his spine, shouldn't

Specter have considered the likelihood a bullet on the opposite right to left trajectory would similarly strike his spine?

So, why didn't he? Was he afraid of what he'd find? Both Dr. John Nichols in the seventies, and Dr. David Mantik in the nineties, studied the anatomy of the neck, and the trajectory of the bullet through Kennedy's neck, and concluded that the bullet, should it have entered the entrance described in the autopsy report, and exited the exit described in the autopsy report, would have struck his spine. This is so readily apparent, in fact, that one of the first articles on the president's wounds, by Frank Carey for the Associated Press, noted: "Pathologists here speculated that President Kennedy's spinal cord and some vital nerve tracts near the base of his brain may have been badly damaged by the bullet that killed him on Friday...the Washington pathologists said that if the neck wound was near the Adam's Apple, which is on the mid-line of the neck, the bullet probably struck the spinal cord, which runs up to the brain via the back of the neck, also at the mid-line. They said a bullet entering the body near the Adam's Apple--or leaving it at that point--could also plow into vital nerve channels at the base of the brain."

When I looked at this issue myself, I just couldn't find a way for the bullet to squeak through. Although some single-assassin theorist trajectories begin above T1, they nevertheless entail that the bullet passed the spine at T1, a level where the spine is considerably wider than it is higher up on the neck (even when one ignores the problematic first rib). From photos and x-rays and from the HSCA's Exhibit F-58, I was able to estimate that the spine at T1 is 60% the width of the neck above it. As my neck is approximately 5 inches wide, I estimated that Kennedy's spine was 3 inches wide at T1. This means that it extended 1.5 inches across the midline. Since the spine is slightly more than halfway between the back wound and the throat wound, however, this means that, even if the middle of the bullet entrance (which was $\frac{1}{4}$ inch wide) was 2 inches to the right of the midline the bullet would strike the spine at just less than one inch from the midline, a half inch or so in from the tip of T1. If the bullet entered closer to the spine—by my analysis the entrance was roughly $1\frac{1}{2}$ inches from the midline of the spine--then the bullet would have struck the spine at a point more than $\frac{3}{4}$ of an inch in from the tip. The width of the spine at T1 alone, therefore, even without the problematic first rib, necessitates that the bullet passed either above or below this level. But if the bullet entered at T-1 and passed above this level, the bullet would not be likely to exit at the T1 level of Kennedy's throat, as described by the doctors and demonstrated by the autopsy photos.

Which means the only way to make the single-bullet theory work is to bend it like Canning and disregard the medical experts and assert that the bullet entered above T1 and passed slightly above T1 and the first rib en route to an exit at approximately the T1 level. This has its own set of problems, however. A bullet passing just over T1 would pass at C7. In 2012, at a shopping mall, I noticed that within a series of booths set up to welcome runners returning from a 10k race for charity there were two chiropractors, and that each of them had a model spine set up to advertise his wares. I inspected these spines and spoke to these chiropractors, and they both confirmed without any hesitation whatsoever that there was "no way" a bullet could pass between the transverse processes of C7 and T1 without striking bone. (This confirmed a point I'd made years before with single-assassin theorist John McAdams, who'd repeatedly claimed a bullet could have passed on such a trajectory, and that he'd demonstrated this many times with a dowel.) In any event, this suggests that, for the bullet to pass over T1 without incident, it would have to pass the spine at C6 or higher--inches above the level of the trajectory proposed by the HSCA Forensic Pathology Panel.

If there's some reason to believe Kennedy's spine at T1 is not as wide as I've ventured, however, or if there is some reason to believe that the bullet entered higher than C7 and just missed striking bone, I'd appreciate someone demonstrating just how this occurred. Similarly, if someone can come up with a reason to believe Kennedy was bent over at the moment of impact, as depicted in HSCA Exhibit F-46 (only with a higher back wound), then maybe the single-bullet theory can be defended.

Even then, however, there will still be significant problems with this fantastic theory, reviled the world over, that some nevertheless claim as a "fact."

The Speed Trap

The testimony of the HSCA's wound ballistics expert, Larry Sturdivan, is that the first bullet to strike Kennedy was traveling over 1700 feet/second as it passed through his neck. Later, in his 2005 book, *The JFK Myths*, he increased this "probable velocity" to somewhere between 2045 feet/second and 1780 feet/second. This bullet was purported to have struck only soft tissue, and done little damage to the neck. And yet, Dr. Gary Ordog, in his book *Management of Gunshot Wounds*, notes that the mortality rate for high-velocity gunshot wounds to the neck is over 50%. He explains: "*Vascular injury caused by missile wounds from bullets moving faster than 1,000 feet/second has been shown to occur by neat shearing of the vessel without stretching it first, as occurs with low-velocity missiles. This is followed by cavitation that damages a more extensive area of the blood vessel, possibly extending for at least 20 mm on each side of the bullet's path.*" He further explains that "*Cavitation stretches the smaller blood vessels, shearing and rupturing them as well as nerves and even bone.*" He later concludes: "*In the author's experience, up to 100% of patients with high-velocity bullet wounds of the neck have major structural damage requiring surgery.*"

Should one think that Ordog was some ill-informed civilian spouting his personal impressions, one should know that in support of his statements he cited a study performed by Sturdivan's employer, Edgewood Arsenal, and published in the *Archives of Surgery* in August 1970. This study concludes "*The high velocity missile neatly shears the arterial wall, but the apparent explosive effect of the temporary cavity causes 'blunt' trauma in a crushing manner.*" A chart prepared for this study, moreover, shows that a high-velocity bullet just missing an artery will nevertheless cause breaks in the artery, even when traveling as slow as 1,000 fps.

Now compare those descriptions of the damage one might expect to find with what Kennedy's autopsist, Dr. James J. Humes, told the Warren Commission he actually found. From his March 16, 1964 testimony: "*We examined in the region of this incised surgical wound which was the tracheotomy wound and we saw that there was some bruising of the muscles of the neck in the depths of this wound as well as laceration or defect in the trachea...it is our opinion that the missile traversed the neck and slid between these muscles and other vital structures with a course in the neck such as the carotid artery, the jugular vein and other structures because there was no massive hemorrhage or other massive injury in this portion of the neck.*"

While high-velocity bullets "shear" and "rupture" blood vessels in the neck, the bullet traversing Kennedy's neck was reported to have only "slid between" these vessels. While Dr. Ordog noted that up to 100% of those receiving a high-velocity gunshot wound to the neck have "major structural damage requiring surgery" Dr. Humes claimed there was "no massive hemorrhage or other massive injury" to Kennedy's neck. Hmmm...

Okay, you might be thinking, this was just the opinion of one of the autopsists, Dr. Humes. Perhaps Dr. Humes had missed something, and the other doctors disagreed and hadn't bothered to correct him. But this wasn't just Humes' speaking for the others... In 1965, Dr. Finck wrote his superior, General Blumberg, and told him not only that "*I examined the tracheotomy skin wound and the trachea and did not find evidence of a bullet wound,*" but that all three autopsists had examined the tracheotomy wound and that "*None of us noticed a bullet wound along its course.*" Double hmmm...

And to close the circle, when discussing the throat wound with the HSCA's Andy Purdy on August 17, 1977, Dr. Boswell is reported to have claimed he was "*certain...no major blood vessel (was) damaged*

by the path of the missile." Triple hmmm...

When one considers that Dr. Charles Carrico, the emergency room doctor who first examined Kennedy, also noted only minor damage to his throat, telling the HSCA that he'd observed *"some modest amount of hematoma in the recesses to the endo right of the trachea"* and that Malcolm Perry, the Parkland surgeon who performed Kennedy's tracheotomy, not only confirmed Carrico's conclusion there was little damage to the neck, but initially described the exit wound as being only 3-5 mm wide--smaller than the bullets fired by Oswald's rifle--well, then it becomes pretty darned clear that something is just wrong with the supposed single-bullet "fact". It just doesn't add up. The bullet creating Kennedy's throat wound--if it was a bullet--was almost certainly not traveling at a high velocity.

The more one digs, the clearer this becomes. Beyond testifying to his observing a small hole in the throat, and a lack of damage to the blood vessels, Dr. Perry told the Warren Commission that, before it was obscured by a tracheotomy incision, he had observed a *"small ragged laceration of the trachea on the anterior lateral right side."* A small laceration.

He later specified just how small. In 1978, when contacted by the HSCA and interviewed by its counsel Andy Purdy, he claimed that the laceration *"was on the right side of the trachea, and that it was incomplete, and I don't remember whether it was a third or a quarter of the circumference..."*

As you might have guessed, this makes little sense should Kennedy have actually been hit by a high-velocity bullet. According to Dr. D.F.N. Dixon in *Management of Gunshot Wounds*, *"Direct impact on larynx or trachea from bullets fired from high velocity military rifles or carbines will produce severe damage from their high kinetic energy, tumbling, or cavitation effect."* Furthermore, Drs. Kenneth and Roy Swan in their book *Gunshot Wounds: Pathophysiology and Management* note that *"Gunshot injuries of the larynx and trachea are infrequently seen in emergency rooms"* due to such injuries usually being associated with *"fatal exsanguination (bleeding) from injured common carotid arteries and internal jugular veins."*

Surgery in World War II, a book released by the Surgeon General of the U.S. Army in 1962, confirms this harsh assessment. A chapter written by a former surgeon of the Fifth Army, which fought Italian forces in Sicily, reports that when treating neck wounds he needed to effect *"Debridement (the removal of dead and damaged tissue) of all structures"* as *"Multiple involvement was the rule because of the anatomy of the area."* And it's not as if this understanding was restricted to military surgeons; Earl Ubell, Science Editor of the New York Herald-Tribune, described Kennedy's wounds on 11-23-63 in a manner suggesting he knew something of the destruction brought by a high-velocity bullet's slicing through a neck. He wrote *"The bullet that crashed through President Kennedy's neck and head probably took with it blood vessels and nerves leaving his entire body stunned and helpless."*

From this it seems likely that, in 1964, when the Warren Commission first released the medical reports and testimony regarding President Kennedy, there were many military and emergency room doctors, and even science editors for daily newspapers, who were aware of the single-bullet theory's speeding problem, who opted to say nothing.

It seems possible, however, that there are many other doctors, including experienced forensic pathologists such as Michael Baden, who are currently unaware of this problem. In 1980, during a seminar on forensic pathology and homicide investigation in Toronto, Ontario, Dr. Baden admitted that *"less than a tenth of 1%"* of the gunshot wounds studied by his New York coroner's office were by *"military rifles,"* and that almost all the rest came from handguns or shotguns. He admitted further that Kennedy was killed *"by rifle type ammunition which we know very little about."*

While one might assume that thousands of doctors with WW II experience would know more than Baden, and would have been able to assist the HSCA, this is not necessarily true. *Surgery in World War*

II confirms the rarity of Kennedy's wounds. Among its graphs and charts it reveals that intra-cranial head and neck wounds each accounted for but 2% of the wounds seen at the hospital level, and that rifle fire accounted for but 5% of the wounds studied. From this one can estimate that during WW II a U.S. doctor would see someone with a head wound created in the same manner as Kennedy's was purportedly created, oh, once every thousand patients or so, and someone with a neck wound created in the same manner as Kennedy's was purportedly created, also about once every thousand patients or so. This brings up the additional question of why neither the Warren Commission nor the HSCA Forensic Pathology Panel consulted with doctors who'd seen the effects of Mannlicher-Carcano ammunition on soldiers, and instead used doctors affiliated with the U.S. military and/or large research facilities dependent on government grants.

Should one think it unlikely that a layman as myself should recognize this problem with the single-bullet theory bullet's velocity, when so many supposed experts, including those on the HSCA's Forensic Pathology Panel, have looked the other way, one can take comfort that one of Kennedy's emergency room doctors, Dr. Ronald Jones, mentioned this problem long before I. When asked by Arlen Specter if the throat wound could have been an exit of an M/C rifle bullet, he told the Warren Commission: *"If this were an exit wound, you would think that it exited at a very low velocity...to the point that you might think that this bullet barely made it through the soft tissues and just enough to drop out of the skin on the opposite side."*

And should one assume that Jones was a bit of an oddball, and that his fellow physicians at Parkland Hospital couldn't possibly have shared his impression that the bullet creating Kennedy's throat wound was not traveling at a high-velocity, one should know that Dr. Baxter also told Specter that the small throat wound was not in keeping with what he would expect from a high-velocity bullet. When asked by Specter why he thought such a small wound was unlikely, he replied: *"It would be unlikely because the damage that the bullet would create would be---first its speed would create a shock wave which would damage a larger number of tissues, as in its path, it would tend to strike, or usually would strike, tissues of greater density than this particular missile did and would then begin to tumble and would create larger jagged--the further it went, the more jagged would be the damage that it created; so that ordinarily there would have been a rather large wound of exit."*

Now, to be clear, Dr. Baxter accepted that the small exit, under the circumstances described by Specter, was *"perfectly understandable."* But the circumstances described by Specter were not the actual circumstances. Here is Specter's question: *"Dr. Baxter, what would your opinion be if these additional facts were present: First, the President had a bullet wound of entry on the right posterior thorax just above the upper border of the Scapula with the wound measuring 7 by 4 mm. in oval shape, being 14 cm. from the tip of the right acromion process and 14 cm. below the tip of the right mastoid process--assume this is the set of facts, that the wound Just described was caused by a 6.5 mm bullet shot from approximately 160 to 250 feet away from the President, from a weapon having a muzzle velocity of approximately 2,000 feet per second, assuming as a third factor that the bullet passed through the President's body, **going in between the strap muscles of the shoulder** without violating the pleura space and exited at a point in the midline of the neck, would the hole which you saw on the President's throat be consistent with an exit point, assuming the factors which I have just given to you?"*

Well, as we've seen, there was no evidence the bullet passed between the strap muscles of the shoulder. This is something Specter invented, as a consequence of either his lack of integrity or his lack of competence. Yes, Dr. Humes testified that there was a bruising of the strap muscles, and that in hindsight this suggested the passage of a bullet exiting the throat, but the strap muscles HE was describing were on the front of the neck, and not the back of the shoulder.

And no, Baxter was not the only Parkland doctor asked to concur with the throat wound being an exit for a high velocity bullet under the blatantly false circumstances described by Specter. Specter played

the same trick (or made the same stupid mistake, take your pick) with Dr.s McClelland, Carrico, Perry, and Jenkins. Dr. McClelland even agreed the wound could be an exit for a high velocity bullet under the incorrect assumption a Carcano bullet would lose much of its velocity in soft tissue. He had thereby supported Jones' belief the throat wound was inconsistent with a wound made by a bullet still traveling at a high velocity.

While Carrico, Perry and Jenkins agreed with Specter's make-believe scenario without reservations, furthermore, we have reason to believe at least two of them were either just playing along, or later came to realize their mistake.

Operative Trauma Management: an Atlas, a medical text book published in 1998, instructs that with high velocity gunshot wounds to the neck, *"damage may be remote from the missile tract as a result of blast injury, and the incidence of major associated injuries is high."* As discussed, there was no such damage in Kennedy's neck. This makes clear, then, that the wound to Kennedy's throat did not give the appearance of a high-velocity gunshot wound to those inspecting Kennedy's wounds. And guess what? The editor of Operative Trauma Management was none other than Dr. C. J. Carrico, the first doctor to examine Kennedy's throat wound. And guess what? The author of the cited passage was none other than Dr. Malcolm Perry, who performed a tracheotomy on Kennedy expecting to find damage to the underlying vessels, only to note no such damage beyond a small ragged wound to Kennedy's trachea.

And should one think I'm quoting Dr. Perry out of context, there's this... In 2011, an 11-17-81 letter from Dr. Perry to a student named Stephen Munson was auctioned off over the internet. A link to this letter was sent my way by David Butler. In this letter, Dr. Perry tried to explain his error in calling Kennedy's throat wound an entrance wound. He wrote *"I initially thought that the neck wound was an entrance wound only because it was small, as entrance wounds tend to be, but this is not invariably the case. Full-jacketed bullets and small missiles may produce small wounds on exiting, especially if their velocity has decreased appreciably..."*

And should that not be enough to convince one that this problem deserves our attention, one should also be aware that at least one of the HSCA Forensic Pathology Panel's members refused to let themselves believe that the damage to Kennedy's throat was as minor as reported, and presumed instead that the impressions of Dr.s Carrico, Perry, Humes, Boswell, and Finck were grossly in error. While the Panel kept no publicly-available notes of their discussions, Dr. Baden testified to this dispute, telling the HSCA committee, *"The panel could not unanimously agree as to whether or not the gunshot wound through the back and neck would necessarily be fatal because of the failure to examine the bullet track at the time of the autopsy--dissect the track. As a result we do not know whether there was injury to the spine of the President or to major blood vessels."* The fact that this was even questioned, after Dr. Humes and Dr. Perry testified before the Warren Commission that there was no damage to the spine or major blood vessels, indicates that there was at least one member of the panel who realized that it didn't make a lot of sense for a high-velocity bullet to create so little damage.

This member, if it was but one member, may have been Baden himself. On 8-15-78, barely three weeks before he testified on Kennedy's wounds, Baden testified before the HSCA on Dr. Martin Luther King's fatal wound. Dr. King had also been killed by a high-velocity rifle bullet; it entered his right cheek, smashed through his jaw bone, re-entered his neck, smashed through his spine and was found beneath the skin on the left side of his back. During his questioning, Dr. Baden was asked by Congressman Sawyer if a high-velocity bullet would cause *"extensive damage and severe damage to tissue out beyond its track because of the lines of force it creates within the body."* Dr. Baden's answer is most informative; after discussing the bones actually hit by the bullet, he added *"If the bullet continued through the spine, it would have severed the spinal cord. If it didn't continue through the spinal canal and sever the spinal cord, the lines of force from the impact would have severely damaged the spinal*

cord without even touching it; and much of the extensive hemorrhaging and destruction of the tissues in the face and neck area of Dr. King were due to the lines of force that you allude to, sir."

The wound as reported by Carrico, Perry and the autopsy doctors was just not severe enough to have been created by a high-velocity rifle bullet. A WW II-era report on the Bougainville Campaign, found online, describes a dozen or so chest wounds caused by 6.5 mm ammunition. The average wound of exit was many times that of the average wound of entrance, with several more than 10 times as large. While the entrance wound in Kennedy's back is believed to have been larger than the exit in his throat, I found no instances of thoracic wound entrances being larger than their exits, and only one instance where the entrance was more than one third the size of its exit. While these shots were virtually all at closer range than the shots striking Kennedy, and while all these shots were fatal, and therefore automatically more severe than the one striking Kennedy, the small size of the exit in Kennedy's throat still seems curiously disproportionate. By way of example, one man shot by a sniper from 150 yards, more than twice the length of the shot from the sniper's nest to Kennedy at Z-224, was found to have a 3 cm by 1.5 cm exit wound on his chest, more than ten times the size of the small wound observed in Kennedy's throat.

Yes, the wound was just too small. While some, including Dr. Lattimer, have noted that bullets exiting from skin covered by tight clothing will often create an exit smaller than the width of the bullet, they fail to comprehend or acknowledge that such an exit, often referred to as a "shored" or "supported" exit, leaves behind a tell-tale sign. According to Dr. Vincent J. M. Di Maio, in his 1992 book *Gunshot Wounds*, and as demonstrated online in Milicent Cranor's article *Trajectory of a Lie*, shored exit wounds are *"characterized by a broad irregular band of abrasion of the skin around the exit. In such wounds the skin is reinforced, or "shored," by a firm surface at the instant the bullet exits...Shored wounds have very wide, irregular abrasion collars and when dry may simulate contact wounds."*

Now this is nothing new. In 1976, Abdullah Fatteh, in his book *Medicolegal Investigation of Gunshot Wounds*, noted: *"If a bullet exits the skin without any resistance other than the tissue resistance, an exit hole with subsidiary tears results...If, however, the bullet exits from the skin against pressure from a firm or hard object in contact with the skin, the appearances of the exit wounds are different...If the object in contact with the skin is hard and the bullet exits against considerable resistance from it, the exit wound may not only be round but it may show a rim of abrasion in its margins. Such exit wounds could easily be mistaken for entrance wounds. Exit wounds of this nature may be seen when the victim is lying on the ground or standing against a wall when and the exited bullet is stopped by the ground or the wall. They may also be caused when the exited bullet hits a belt, buckle, tough clothing or a similar object in tight contact with the skin."* Notice that Fatteh says such a wound "may" show a rim of abrasion, not that one can expect it to show such a rim.

A 1981 article by Dr. Douglas Dixon in the *Journal of Forensic Sciences* entitled *The Characteristics of Shored Exit Wounds*, however, proclaimed: *"If the exit wound is "shored" or abutted by a firm support such as clothing, furniture, or building materials, then the exit wound may take on appearances of an entrance wound, such as a circular defect with an abraded margin. This can occur with contact, close range, or distant shots. 92% of shored exit wounds in one study had a round or ovoid defect, and all had some degree of abrasion. The degree of shoring abrasion increased directly with the KE of the projectile and the rigidity of the shoring material."* Notice that Dixon concludes that all such wounds have some degree of abrasion and that the abrasion is related to the amount of energy released in the tissue and the rigidity of the shoring material.

A September 1983 article by Dr. Josephino Aguilar in the *Journal of Forensic Medical Pathology*, moreover, shared this conclusion. Aguilar concluded that one could distinguish shored wounds of exit from entrance wounds by the *"scalloped or punched-out abrasion collar and sharply contoured skin in between the radiating skin lacerations marginating the abrasion."*

These studies then support Di Maio's subsequent claim that abrasion rings are "characteristic" of such wounds, and would most certainly be expected at the shored exit of a military rifle bullet.

This appears to be the modern consensus. The "abrasion ring problem" discussed by Cranor is reinforced by numerous other textbooks and articles, which refer to "supported" wounds--Lattimer's term for the small exit created by the tie--and "shored wounds", the more commonly used term, interchangeably. The chapter on gunshot wounds in the Encyclopedia of Forensic Sciences (2000) by Stefan Pollak and Pekka J Sauko, for example, claims: *"Occasionally, the margins of the exit wound are abraded (shored) when a firm object (e.g., tight-fitting clothes, floor, wall or back of a chair) is pressed against the body at the site of the exiting projectile (Figures 3c and 5c). Under such circumstances, the skin around the exit is abraded by the supporting surface. In contrast to the "original" abrasion ring around the entry wound, in "shored" or "supported" exits the area of abrasion is not concentric, but irregular or lopsided and often disproportionately large [17]."* Notice that the "rim of abrasion" Fatteh once said "may" be seen is now to be expected.

The doctors describing Kennedy's throat wound at Parkland described a small hole, with no noticeable abrasion ring. The autopsy doctors also failed to observe this abrasion ring. And there is no abrasion ring apparent in the autopsy photos. Even the HSCA pathology panel, which took Lattimer's cue and believed the throat wound to be a shored wound of exit, noted that the margins of what they took to be the exit wound along the bottom of the tracheotomy incision in the photos were only *"slightly denuded and reddish-brown."* They failed to note an abrasion ring. It follows then that there is no evidence the small hole in Kennedy's throat was a shored or supported (Lattimer's term) exit, and that the evidence, in fact, suggests it was not. The report of the HSCA pathology panel noted: *"Several panel members are also of the opinion that an unshored exit wound of a missile of comparable size and velocity might be similar if the missile were not misshapen by striking a substantial bone within the body."* This means the bulk of the panel was not of this opinion, and believed the shoring of the throat wound to be the only logical excuse for the small size of this exit, should the exit have been for the bullet recovered at the hospital, and fired from Oswald's rifle. This suggests that the small size of the throat wound is, in the eyes of modern forensic science, an unsolved mystery.

When I pored through forensics journals looking for any record of a bullet traveling a trajectory like that purported for the so-called "magic bullet," I found further reason to doubt. The October 1975 Journal of Forensic Sciences, for example, describes the death of a woman after she was struck in the throat, in the same location as Kennedy's throat wound, with a .25 caliber jacketed slug similar in width to the bullets fired from Oswald's rifle. This bullet traveled on a similar trajectory as the purported trajectory through Kennedy, albeit in the opposite direction. This bullet was recovered from the right transverse process of the 7th cervical spine, the area of the spine purportedly damaged by the passage of the bullet through Kennedy. However, even though this bullet was accidentally discharged from a pen gun and was traveling at a much slower speed than the bullet purportedly traversing Kennedy, it severed the woman's right common carotid artery in passage, and brought about her death.

Intriguingly, the article was co-written by Dr. Werner Spitz, a defender of the single-bullet theory, who served on both the Rockefeller Commission's medical panel and the HSCA's forensic pathology panel. Dr. Spitz needs to explain then how the supposedly high-velocity bullet striking Kennedy could traverse his neck and do so little damage, while a much slower bullet traveling on the same trajectory was so lethal. Until that time, there's no reason we should take the single-bullet theory seriously as a theory, let alone accept it as a "fact".

Connally's Chest Wounds

When one looks at the presumed trajectory of the bullet striking Connally, one finds yet another reason to doubt the single-bullet theory. (I know. I know. This is reason number umpteen. But I'm trying to put this garbage of a theory where garbage belongs, in a trash heap, NEVER to be recycled.) While a bullet traveling a flat trajectory from the entrance on Connally's back might indeed have caused a glancing blow to his fifth rib, and have exited without penetrating his lung, the fact is that the bullet exited from just below Connally's nipple at a much wider part of his chest, and that it, to quote Dr. Robert Shaw's testimony before the Warren Commission, "stripped away" "about 10 centimeters of the fifth rib starting at the, about the mid-axillary line and going to the anterior axillary line." While the HSCA's Dr. Charles Petty shared Dr. Shaw's impression of the wound and theorized that the bullet destroyed all this rib without ever piercing Connally's lung, this is extremely hard to believe when one looks at cross-sections of the chest and notes the entrance and exit locations on Connally. As Connally was turned to his right when struck, moreover, and as the bullet doing the striking was believed to have come from his right, he was simply not in the proper alignment to have the bullet slide along his right rib, whether on the outside or the inside of the rib. Of course, it also makes little sense for 10 cm of rib to be "stripped away" (as opposed to "fractured") by a bullet striking just a glancing blow. From this we can see why the rest of the HSCA panel rejected Petty's proposal. But this raises a dilemma for single-bullet theorists, far and wide. Unless one is to believe that the initial impact of the bullet in the armpit broke the rib into multiple pieces clear up to the point where the bullet made its exit, one is forced to concede that the bullet, having already passed through Kennedy, hit Connally's rib *upon entrance, hit it again upon exit*, blasted through his wrist and then penetrated his thigh, all the while suffering no more damage than one fired into cotton.

The Warren Commission hired Dr. Alfred Olivier to see if this could be. Olivier and the staff at Edgewood Arsenal, fired Mannlicher-Carcano bullets through simulated necks, simulated chests, and actual cadavers' wrists. He concluded the single-bullet theory was viable. He failed to simulate the wounds all at once, however. In 1967, CBS hired him to conduct a more thorough test. On the CBS program *The Warren Report* a bullet was shown passing through a simulated neck, a simulated chest, and a simulated wrist only to bounce off a simulated thigh. In a televised interview, Olivier admitted that, in Connally's "case, the bullet passed along the rib, fractured the rib, throwing fragments into the lung. Of course, *we have no rib here*, but it still simulates passing through the flesh." He went on to state that even without simulating the damage to Connally's rib, which would have greatly slowed the bullet prior to its even striking the wrist, "In some cases, it passed through the wrist; *in other cases it lodged in the wrist*." Amazingly, CBS declared the tests a success anyhow, insisting that the bullet would only have needed a little more velocity to penetrate the thigh. In 2003, the Discovery Channel created a similar simulation, with similar results. Once again the bullet, without being asked to strike any simulated ribs at the exit point of a simulated chest, bounced off a simulated thigh and the program declared its simulation a success.

In 1967, in the book *Where Death Delights*, Dr. Milton Helpert, a man who had supervised 10,000 autopsies on gun shot victims, explained why these tests failed. He said: "The single-bullet theory requires us to believe that this bullet went through seven layers of skin—tough, elastic, resistant skin....In addition to these seven layers of tough, human skin, this bullet passed through other layers of soft tissue, and then these shattered bones!...I just can't believe that this bullet had the force to do what Mr. Specter and the Commission have demanded of it."

But this wasn't the only test performed by Olivier to be misrepresented. In order to "simulate" Connally's chest wounds and the proposed glancing blow off his rib for the Warren Commission, Olivier arranged for thirteen sedated goats to be shot. In only one of these attempts did the bullet glance off the bone as proposed. The recovered bullet from this attempt, furthermore, was far more

damaged than the magic bullet, even though it had struck a smaller bone. After Dr. Cyril Wecht brought this up before the HSCA, HSCA special counsel I. Charles Mathews asked their ballistics expert Larry Sturdivan for an explanation. Sturdivan testified: "Exhibit 853 was a bullet that has ricocheted from the rib of a goat carcass, as Dr. Wecht indicated. However, let's remember that the goat, which is roughly 100 pounds, is much, much smaller than Governor Connally and, therefore, the bullet passed through a relatively small amount of tissue before it hit the bone, and therefore, lost correspondingly less velocity. So we would have to say that the striking velocity on that bullet, CE 853, was *much in excess* of the striking velocity on Governor Connally, *even if the bullet had passed through nothing before it hit Governor Connally.*" That Sturdivan was spinning in order to shut down speculation was made clear by his statements moments later. After being asked for the difference in velocity between a bullet striking Kennedy and then Connally versus one directly striking Connally, he replied: "this bullet if only encountering a few inches of soft tissue would go through losing *almost no* velocity, 100 feet per second or thereabouts." Thus, in Sturdivan's expert opinion, the inch or less of flesh in Connally's armpit overlying his rib would do more to slow a bullet's velocity than the 5 ½ inches of muscle and tissue in Kennedy's back and throat! The wounds are seemingly from different worlds. And at war with one another.

The absurdity of this war was reinforced by Sturdivan in his 2005 book *The JFK Myths*. In Table III he relates the probable speed of the magic bullet at seven steps of its voyage. Sturdivan proposes that the bullet was traveling at 2160 fps (plus or minus 30 fps) when fired, 2015 fps (plus or minus 30 fps) upon impact with Kennedy's neck (and yes, he writes "neck"), 1830 fps (plus or minus 50 fps) upon impact with Connally's back, 1450-800 fps (plus or minus 100 fps) while penetrating Connally's rib, 500 fps (plus or minus 100 fps) upon impact with Connally's wrist, and 135 fps (plus or minus 20 fps) upon impact with Connally's thigh. This is PREPOSTEROUS. Amazingly, he actually proposes the bullet lost more velocity in Connally's back before penetrating his rib (380 fps plus or minus 100 fps) than from passing through 5 1/2 inches of Kennedy's neck (185 fps plus or minus 50 fps) or shattering Connally's wrist (365 fps plus or minus 20 fps).

If you're wondering how a supposed expert could dream up anything so ludicrous, well, you need to look at Table II in Sturdivan's book. In Table II, he notes the speeds at which bullets like those used in the assassination rifle will deform. Here, Sturdivan relates that such a bullet traveling point first will deform on bone (such as Connally's rib) at 1700 fps and that such a bullet traveling sideways will deform on bone at 1400 fps. As the magic bullet was purportedly traveling sideways as it impacted Connally's rib, and emerged almost unscathed, Sturdivan had to find a way to lower its velocity from the 1830 fps or so it would be traveling upon exit from Kennedy's neck. So he simply decided that Connally's back flesh substantially slowed the bullet before it impacted on Connally's rib around 1450 fps. There were no tests to support this conjecture, at least none mentioned in his book. He simply decided.

No, that's not quite fair. In Appendix B of his book, Sturdivan offers an explanation for his conclusion. It's an extremely weak explanation, but an explanation nonetheless. You see, Sturdivan realized that the bullet traveled approximately 25-30 cm through Connally's back and chest, and was purported to have destroyed 10 cm of Connally's rib. He then assumed from this, on no apparent basis, that this 10 cm represented the middle third of the bullet trajectory, and that, therefore, the bullet traveled as much as 10 cm or 4 inches through Connally's body before striking his rib. Apparently, it never occurred to him to look at the entrance location near Connally's armpit, and project 4 inches forward along the trajectory from this entrance. If he had he would have seen that a bullet traveling sideways, as proposed, was on a direct course for the rib, and would have impacted the rib within the first inch or so of its journey.

If you're thinking that Sturdivan is a scientist, and his writings above reproach, you should consider

that wound ballistics expert Dr. Martin Fackler, in his testimony in the 1992 ABA mock trial of Oswald, testified that, in his estimation, the bullet exited Connally's rib and struck Connally's wrist at 900 fps. This is almost twice the speed of the bullet traveling 500 fps (plus or minus 100 fps) proposed by Sturdivan, and makes little sense if one considers Sturdivan's approximation that the bullet traversing Connally's chest lost 1200 fps or more in velocity accurate. This not only demonstrates the speculative nature of this "science," but suggests that Sturdivan stealthily cut the velocity of the bullet before it hit the rib, as here proposed. I mean, let's think about it: if the bullet had struck Connally's back at 1830 fps, as proposed by Sturdivan, and struck Connally's wrist still traveling 900 fps, as proposed by Fackler, it would most certainly have struck and penetrated Connally's rib at a speed well over 1400 fps, at a speed at which the rib would have grossly deformed the bullet.

And should one still think my suspicion of Sturdivan unfair, and that he would not have changed his findings to support that the bullet striking Connally could have been as undamaged and as nearly pristine as CE 399, one should consider the testimony of one of the HSCA's experts that "the bullet would begin to deform, if it strikes say, soft tissue, at something--remember, the density of soft tissue is around one, the density of water, and it will begin to deform at something in excess of 2,000 feet per second. In other words, at the muzzle velocity of the Mannlicher-Carcano. If it strikes bone, which is twice as dense, then it would begin to deform nose on at approximately 1,400 feet per second. If the bullet turns sideways, which is a weaker orientation, *it will deform down to around 1,000 feet feet per second.*"

Now, this expert's testimony was clearly at odds with Sturdivan's later assertion that the bullet would not deform if traveling below 1400 fps. And this expert's testimony, if accurate, clearly supports the testimony of Dr. Cyril Wecht that CE 399 would have to have been far more damaged for the single-bullet theory to be credible. And this expert was, furthermore, someone with whom Sturdivan would most certainly have compared notes before deciding the bullet wouldn't deform at 1400 fps. So who was this expert, you ask? Yeah--you guessed it--Larry Sturdivan himself...

The Upside-Down Pyramid

The bruise on the President's lung also raises some questions. When one considers that Dr. Humes told the Warren Commission that the magic bullet did not pierce the President's lung but that it nevertheless left a 5 cm wide "pyramid-shaped" bruise at the lung's tip, it should seem obvious that the damage stretched an inch and a half or more below the presumed bullet path. This is a wider bullet path than one would expect. Single-bullet theorists will explain this by insisting that the bruised lung was caused by the temporary cavity created by the supersonic passage of the bullet. They'll claim this same cavity caused the damage to the transverse process of the first thoracic vertebrae apparent on the x-rays.

But there are severe problems with this. For one, the ballistics experts of the Warren Commission and HSCA testified that the bullets fired by Mannlicher-Carcano rifles were among the most stable they ever tested, and, as a result, could pass through one man and hit another with relative ease. Unspoken but implicit in their testimony, however, is that these bullets transmit less energy into the surrounding tissue than other bullets of their class and leave a narrower wound track. (This characteristic of Mannlicher-Carcano ammunition was not exactly unnoticed by those who make it their business to notice such things. As far back as 1897, The Columbus Medical Journal noted that "In the Abyssinian campaign of the Italians, the disabling effect of the Mannlicher-Carcano rifle of 6.5 millimeters, with which they were armed, was so slight that it was thought that the ammunition had been tampered with: for the natives overcame them with frightful slaughter.")

A second problem is that, even if a Mannlicher-Carcano bullet was able to create such a cavity, since the bullet would presumably be at the center of this cavity, the temporary cavity would be around 3

inches wide. A study by the Biophysics Division of the Army's Chemical Warfare Laboratory published in Military Medicine in 1957 correlates the size of temporary cavities to permanent cavities and demonstrates that a bullet creating a 3 inch wide temporary cavity would be likely to leave a permanent cavity 15mm wide or better. When one considers that the passage of this particular bullet was impossible to probe at autopsy, left the major vessels of the neck unharmed, and left only a 3-5 mm round hole upon exit, it seems highly unlikely such a large cavity was created.

An even bigger problem is that lung is, according to the dozens of articles I've read on wound ballistics, among the least dense tissues in the body, and, as a result, "little energy transfer occurs, and temporary cavities are small." Michael S. Owen Smith made this lack of lung density and how it relates to the Kennedy assassination breathtakingly clear in the 1988 book Management of Gunshot Wounds. He said "The thorax behaves differently from the abdomen because it is largely filled with air owing to the large volume of the chest that is occupied by the lungs. Therefore, since the tissues are not mainly liquid-like, the conditions for the formation of the temporary cavity are not met. The heart and great vessels, which are filled with fluid, are extremely susceptible to damage from cavitation, and such injuries from a rifle bullet are fatal. The lung itself is remarkably resistant to damage from high-velocity bullets. Indeed, it is true to say that the lung and the skin are the two tissues that are most resistant to damage from cavitation." Hmmm.

There is still another problem with the argument Kennedy's lungs were bruised by a temporary cavity and it is that, if one is to assume there was a 3" temporary cavity around the bullet as it passed through Kennedy, one should assume there was an equally large or greater cavity around the bullet as it passed through Connally.

Let me explain. Connally's doctor testified that the bullet passed within an inch of Connally's heart. While my study of the trajectories indicates this wasn't so, that it was more like 3 inches, it also shows that for the bullet to have exited where it did from Connally's lung, it would have to have passed within an inch or so of Connally's liver. (The lower lung where the bullet made its exit sits atop the upper dome of the liver like a sailor's cap sits atop your head.) This bullet is also purported to have struck Connally's back and fifth rib at an angle, and to have traveled sideways through his body along his rib until it exploded outwards, leaving a gaping hole in his chest.

There's a problem with this. According to a June 1990 article in the British Journal of Surgery by Dr.s G. J. Cooper and J. M. Ryan, bullets traveling sideways impart more than three times the energy into the surrounding tissue as bullets traveling straight ahead. The reasons for this are explained in 1997's Ballistic Trauma, by Dr.s Jeanine Vellema and Hendrik Johannes Scholtz.

"The greater the angle of yaw when a bullet strikes a body, the greater the retardation of the bullet and consequently the greater the amount of kinetic energy transfer. This explains why unstable projectiles in flight cause larger entrance wounds on impact with the body. Once the bullet enters the denser medium of tissue, its yaw angle increases progressively until the bullet becomes completely unstable, tumbles and rotates by 180 degrees, and ends up traveling base forward. Tumbling of the bullet in tissue increases the presented cross-sectional area of the bullet, resulting in more direct tissue destruction and increased retarding (drag) forces, with consequently greater kinetic energy transfer and larger temporary cavity formation. The sudden increase of the drag force also puts strain on the bullet, which may lead to the break up of the bullet and more tissue destruction."

Now plug this in to the official story. According to the HSCA ballistics expert Larry Sturdivan, the bullet struck Kennedy in the back at 1800 feet per second, met minimal resistance, struck Connally at 1700 feet per second, and blasted out his rib at 1,100 to 1,300 feet per second. This indicates the bullet passed nearest the liver between 1300 and 1500 feet per second, traveling sideways, creating a temporary cavity much larger than the temporary cavity created in Kennedy's neck.

Now consider the damage this would do to Connally's liver.

Once again, Michael S. Owen-Smith in the book *Management of Gunshot Wounds*: "Direct damage from a high velocity missile is catastrophic, because the liver is extremely susceptible to cavitation damage and the resultant pulping of liver tissue is so extensive that most cases are fatal...Liver and spleen are so sensitive to cavitation and shock effects that they may be damaged even when the rifle bullet passes through the chest...Lesser degree of damage from bullets passing close to the liver would result in damage similar to that from low-velocity bullets or blunt injury." No such damage was reported. The *Textbook of Military Medicine*, put out by the Surgeon General of the U.S. Army, moreover, confirms: "Liver, spleen, and kidney are highly vascular, friable organs (that is, the tissues lack elasticity, they tear when they are stretched). Temporary cavitation causes severe tissue disruption...Such injuries are rapidly fatal."

Ironically, the fact that Connally survived raises grave doubts about the manner in which Kennedy died.

Ovoid? Oy Vey!

Despite the problems presented by Connally's wounds discussed above, the Warren Commission, in its report, cited the size of Connally's back wound as possible evidence the bullet had first struck Kennedy. This was clearly spin, however. On page 92, the report claims "Because of the *small* size and clean-cut edges of the wound on the Governor's back, Dr. Robert Shaw concluded that it was an entry wound." Then, on page 109 it claimed "the *large* wound on the Governor's back would be explained by a bullet which was yawing, although that type of wound might also be accounted for by a tangential striking." The report failed to note that the expert stating that the back wound was large and that the bullet may have been yawing, Dr. Olivier, did so under the impression the back wound was 3 cm in its largest dimension, and that the doctor claiming the back wound was small and a tangential strike, Dr. Shaw, testified that this 3 cm measure was not the actual measurement of the wound, but the measurement made after he'd cut away the damaged skin along its edge.

By the time of the HSCA, unfortunately, the Warren Commission's use of the back wound size as possible evidence had ballooned into its use as conclusive evidence. The HSCA's Dr. Baden, almost certainly under the influence of a November 1974 article by Dr. Lattimer in *Medical Times*, cited the shape of Connally's back wound as clear-cut evidence for the single-bullet theory. In his testimony before the committee, Dr. Baden testified that "*the panel concluded, based on the enlarged nature of the entrance perforation in the Governor's back, that the bullet was wobbling when it struck him and had to have struck something before striking the Governor.*"

It seems evident, however, that not everyone on his panel concurred. The report of Baden's Forensic Pathology Panel, published the next year, claimed instead that "*The panel believes that the ovoid characterization of this wound requires interpretation...One possible interpretation is that the avoid entrance wound, as described, could have resulted from the missile striking the skin surface on a tangential plane...Another possible interpretation of this ovoid wound is that the missile itself, just, prior to striking the body, was out of alignment with its trajectory (due to striking an intervening object). That is to say, it had tumbled slightly before entering the body, thereby creating an elongated defect...The panel, in its evaluation, also considers it important that the shape of the defect in the clothing would have been a more uniformly round hole if the bullet had struck on a tangential plane with the missile aligned with its trajectory. The panel (except for Dr. Wecht) concludes, therefore, that the wound in Governor Connally was probably inflicted by a missile which was not aligned with its trajectory but had yawed or tumbled prior to entry into the Governor.*"

Baden testified that the panel had concluded that the bullet creating Connally's back wound *"had to have struck something before striking the Governor"* when the panel, with one exception, had actually concluded that the back wound was *"probably"* inflicted by a missile which was out of alignment. The panel's report said nothing about this bullet having to have hit something before striking the Governor. Dr. Baden had ballooned this possibility into a fact during his testimony, but his colleagues had failed to back him up on it.

Not that anyone noticed. The HSCA's Final Assassinations Report claimed that Kennedy's and Connally's wounds were *"consistent with the possibility that one bullet entered the upper right back of President Kennedy, and, after emerging from the front of the neck, caused all the Governor's wounds...A factor that influenced the panel significantly was the ovoid shape of the wound in the Governor's back, indicating that the bullet had begun to tumble or yaw before entering"* because *"An ovoid wound is characteristic of one caused by a bullet that has passed through or glanced off an intervening object."*

It seems clear, then, that Dr. Baden had misled the Committee about the significance of this ovoid wound. As previously mentioned, and as discussed in Milicent Cranor's excellent online article, Trajectory of a Lie, Dr. Robert Shaw, Governor Connally's doctor, testified before the Warren Commission in 1964 that Connally's back wound was about 1.5 x 5/8 centimeters (4H104), but that he later removed the damaged skin around this entrance and enlarged it to about 3 cm (6H188). By 1974, however, Dr. Lattimer, noticing that 3 cm was the same size as a 6.5 mm Mannlicher/Carcano bullet traveling sideways, seized upon this second measurement and started claiming in his articles that this was the actual size of the wound. Not surprisingly, he asserted that the size of Connally's wound demonstrated the bullet was traveling sideways and not merely at an angle to Connally's back, as testified to by Shaw. As demonstrated by Cranor, Lattimer let out a big smelly lie in the process.

This, of course, would have been the word of but one sloppy researcher/zealot had Baden and others not fallen under Lattimer's smell/spell. Although Dr. Shaw repeated his claim the wound was really 1.5 x 5/8 cm to an HSCA investigator, and was even quoted on this in the report of Baden's Panel, Dr. Baden oversold the significance of this ovoid shape in his testimony before the committee and produced a smelly lie of his own in his 1989 book Unnatural Death. While an HSCA report written by Baden records the length of Connally's back scar as 1 1/8 inches (or 2.9 cm), Baden told Unnatural Death's readers the back wound scar was 2 inches long (or 5 cm).

The impact of Lattimer's and Baden's lies has been palpable. In 1992, in the mock trial of Oswald put on by the American Bar Association and televised on Court TV, Dr. Martin Fackler, testifying for the prosecution, repeated the 3 cm lie, and made matters worse by incorrectly testifying, when it was pointed out to him that Dr. Shaw had told the HSCA that the wound was really 1.5 cm, that Dr. Shaw had only changed his recollection "later on." (Dr. Shaw had, in fact, insisted since first asked that the bullet hole was 1.5 cm long, and that the 3 cm measurement on his report reflected not the size of the bullet hole, but the size of the wound after skin had been removed.) Since then, "researchers" (more like single-bullet theory aficionados or Lattimerites) such as Gus Russo and Dale Myers have also misrepresented the back wound as 3 cm or more in their work. Myers, on his website, actually links to an HSCA report to support that the wound was 3 cm, failing to tell his readers that just below the statement by Shaw in this report is another statement, in which Shaw clarifies his earlier statements, and insists the 3 cm measurement was the measurement of the wound after he'd cut away some of Connally's skin.

Not only do these theorists misrepresent the size of Connally's back wound to sell their theory, they miss that the hole on Connally's jacket and shirt were, according to the HSCA, 1.7 x 1.2 cm and 1.3 x .8 cm, respectively, an impossibility if the wound was truly 3 cm wide, as they propose.

While acknowledging this 1.7 cm tear, HSCA ballistics expert Larry Sturdivan, in his 2005 book *The JFK Myths*, argues that a 1.5-1.7 cm entrance is still ovoid and is therefore still an indication that the bullet struck something--such as a President--before striking Connally. He, as Baden before him, fails to acknowledge that the HSCA determined the defect in *Kennedy's jacket* was even more ovoid (1 by 1.5 cm) than Connally's jacket (1.7 x 1.2 cm) and that the defect in Kennedy's shirt was also an ovoid .8 x 1.2 cm (to Connally's 1.3 x .8 cm). He also overlooks that the entrance on Kennedy's back was originally measured at an ovoid .7 x .4 cm and that the entrance on the back of Kennedy's head was measured at an absolutely ovoid 1.5 x .6 cm. While the ovoid nature of these entrances could indicate that the bullets were tumbling, they more probably indicate that the bullets entered at an angle, exactly as proposed by Dr. Shaw way back in 1964.

Still, there's another possibility. Papers by Ronchi and Ugolini (Zacchia, 1980) and Menzies et al (Journal of Forensic Sciences, 1981) found that a bullet wound of abnormal length or width can be taken as an indication that the weapon firing the projectile was equipped with a silencer. This assertion has been repeated, furthermore, in books such as 1997's *Ballistic Trauma*, by South African forensic pathologists Jeanine Vellema and Hendrik Johannes Scholtz.

Just a little something to think about.

As is this... When the Discovery Channel attempted to replicate Kennedy's and Connally's wounds for their 2004 program *Beyond the Magic Bullet*, the wound on the Connally torso's back created by the tumbling bullet in the program was not ovoid at all, but "keyhole" shaped, and measured 50 x 45 mm.

Ovoid? Oy Vey!

Samples from identical bullets are color-coded

Neutron Activation Analysis Analysis

Another strong argument against the single-bullet theory can be found in the words and works of Dr. Vincent Guinn. While single-assassin theorists cite Guinn as an expert on bullet-lead analysis, and endlessly tout that he testified both before the HSCA and in subsequent televised appearances (such as 1988's PBS program *Who Shot President Kennedy?*) that his test results indicated only two bullets struck Kennedy and Connally, and that the bullet fragment removed from Connally's wrist "matched" and most probably came from the bullet purportedly found on Connally's stretcher, few have actually studied Guinn's results or read his numerous articles.

If they had, they wouldn't be so supportive.

And that's not just me talking. In his book *Every Contact Leaves a Trace* (2000), noted forensic scientist Dr. Zakaria Erzinclioglu reported that, when one actually studies Guinn's results, *"it is clear that the trace element evidence shows that more than two bullets were fired."*

Still, on what basis can a layman as myself question the findings of a nuclear physicist?

Well, without even going into the substantial circumstantial evidence indicating that the bullet supposedly found on Connally's stretcher after falling from his leg was, in fact, found on someone else's stretcher (as per the hospital employees who discovered it—Darrell Tomlinson and Nathan Pool), was never seen until at least an hour after Connally had been rushed into the hospital (as per the nurses and orderlies who removed Connally's clothes and wheeled away his stretcher—Doris Nelson, Ruth Standridge, Jane Wester, and R. J. Jimison) and never lodged in his leg (as per Connally's doctor, Dr. George Shires), there is reason to doubt Guinn's results proved what so many believe. (An alternative explanation for the bullet's presence on the stretcher appears at the end of this chapter.)

If one looks at Guinn's results, one realizes there is a surprising lack of uniformity in the make-up of Mannlicher-Carcano bullets, both from bullet to bullet and box to box. This is because the type of ammunition used in the gun believed to be Oswald's was made from the melted-down lead of other bullets. When one looks even closer at Guinn's analysis, one finds that his interpretation of his test results leaves even more to be desired. Since Guinn believed that similar counts in parts per million of certain elements could leave an identifiable fingerprint of exact bullets, and that antimony, silver, and copper were the most reliable of these elements, let's make a comparison between three sets of bullets on these elements, and Guinn's subsequent conclusions.

Numbers reflect the counts of the two samples in parts per million.

A vs. B. 647-602 antimony, 8.6-7.9 silver, and 44-40 copper.

C vs. D, 833-797 antimony, 9.8-7.9 silver, and 994-58 copper.

E vs. F, 732-730 antimony, 15.9-15.3 silver, and 23-21 copper.

So which two samples were described by Guinn as being from the same bullet?

Well, that's actually a trick question, as A vs. B actually represents FOUR samples, a fragment found in Kennedy's brain, two fragments found on the floor of the limousine, and the nose of the bullet found on the front seat. And yet notice how uniform they seem to be. One might actually conclude they are probably from the same bullet. And Guinn did. Well, since they were so uniform and since Guinn also concluded the wrist fragments came from the magic bullet, then E vs. F must be the comparison between the magic bullet and the wrist fragment, right?

WRONG. E vs. F is a comparison between 6001B and 6003A, test bullets taken from separate batches of ammunition from separate years. Subsequent tests showed them to be quite dissimilar.

Which leaves C vs. D as the wrist/magic comparison. Since the silver and copper ranges are substantial, it's safe to say Guinn's conclusion came purely from the similarity on antimony. He ignored everything else and focused on those two numbers...833-797. And yet, when one looks at the test results, one finds that 6002 A2 was at 869, and 6001 B4 was at 791, within 36 ppm of the magic bullet and the wrist fragment, respectively, and this out of only 40 tests beyond the magic bullet and wrist fragment. This translates to there being a 5% chance for the wrist and magic fragments to fall within 36 ppm randomly. Of the 14 different bullets tested from assorted boxes of Western Cartridge ammunition, in fact, 3, 6000a, 6001d, and 6001A, were within 15 ppm on antimony, even though they were from different years and different batches. This reduces the 833-797 numbers to nothing near the relevance Guinn and such disciples as Kenneth Rahn attach to it. When one takes into account the other six elements tested, in fact, the logical deduction is amazingly the opposite of Guinn's ...that it's highly probable the magic bullet and the wrist fragment ARE NOT related.

A comparison of ranges of the 4 fragments found in the limousine vs. the magic bullet/wrist fragment on the 7 elements tested by Guinn:

Antimony: 4 fragments 647-602, magic/wrist 833-797

Silver: 4 fragments 8.6-7.9, magic/wrist 9.8-7.9

Copper: 4 fragments 44-40, magic/wrist 994-58

Aluminum: 4 fragments 5.5-1.1, magic/wrist 8.1-0

Manganese: 4 fragments 0.1-0.01, magic/wrist 0.09-0.07

Sodium: 4 fragments 134-9, magic/wrist 120-5

Chlorine: 4 fragments 59-22, magic/wrist 257-19

Since the range of 2 related samples should be smaller than the range of 4 related samples (7 out of 8 times), and since the range difference should usually be significant, it's clear that manganese is the only element that suggests the magic bullet and wrist fragment are related, and that antimony and sodium are also consistent with that analysis. It's equally obvious that the other 4 elements tested are strongly suggestive there was NO relation at all between the two, as the range of the 2 samples is many times that of the 4. The proper conclusion then should be that the magic bullet and the wrist fragment are most probably not related. This conclusion is supported by the additional fact that CE 399, while missing some lead, is not believed to have lost any size-able amount of copper. As both Connally's coat by his exit wound and the wrist fragments themselves were found to contain inordinate amounts of copper, one should conclude he was struck by a separate bullet whose jacket had been badly damaged. In short, anyone whose argument for the single bullet theory relies on Guinn's analysis has clearly never studied Guinn's results with an open mind. His conclusion was wrong; whether he sincerely believed his testimony or was asked to lie is open to conjecture.

The FBI v Guinn

While I had not planned on engaging in such conjecture, recent developments in bullet lead analysis have alerted me to much that is suspicious with Guinn's analysis...beyond his incorrect conclusions. On September 1, 2005, the FBI announced they would no longer analyze bullet lead. Their decision was spurred on by a February 2004 report by the National Academy of Sciences questioning the value of bullet lead analysis, particularly in light that it had never been tested by scientists outside those whose careers depended on its presumed worth, including Vincent Guinn. Surprisingly, this study was

performed by the Academy on behalf of the FBI itself, after a former FBI metallurgist named William Tobin began writing articles critical of the probative value of bullet lead analysis. Shockingly, this study even spurred one-time HSCA Chief Counsel Robert Blakey, the man who'd pushed Guinn's findings on the House Committee, to reverse himself and publicly denounce Guinn's findings as "junk science."

Among the reports written by Mr. Tobin and members of the Academy, I found at least three good reasons to suspect that Guinn knew his HSCA testimony was questionable.

1. Although bullet lead analysis was conducted by the FBI for over 30 years, the FBI would not allow its employees to testify beyond that a bullet (usually found within a body) was likely to have come from the same box as bullets found somewhere else (usually in the home of a suspect). The FBI's Cortlandt Cunningham, then Chief of the Firearms section of the FBI Crime Lab, testified in court on February 24, 1977, only months before Guinn's tests, that his agents could only testify that a bullet "could have come from that source or another source with that same composition" and could not identify a fragment as having come from a particular bullet. Guinn's testimony that it was "highly probable" the wrist fragments and the magic bullet were parts of the same bullet is therefore perhaps the only time in history someone has testified to such a degree. Since the National Academy has now found that "The available data do not support any statement that a crime bullet came from, or is likely to have come from, a particular box of ammunition," and that the possible existence of coincidentally indistinguishable bullets "should be acknowledged in the laboratory report and by the expert witness" it would seem apparent that Guinn's expert opinion went well beyond what was warranted.

2. While Guinn said his opinion was based on the results of three elements, antimony, silver, and copper, the FBI at that time was using antimony, copper, and arsenic. Even when Guinn expanded his test to seven elements, arsenic was not included. This forces one to consider the possibility that Guinn tested arsenic, found it did not match, and excluded it from his results. Since silver, which the FBI started using as one of its seven elements in 1990, is reported to have little value, as most bullets are within a small range in parts per million, and are considered to match, its propping up by Guinn as the second most valuable element is also intriguing. Guinn's own results, where more than half of the test bullets matched the wrist fragment in silver, with many of them closer in parts per million than the "magic" bullet determined by Guinn to be identical, support that such a match is not really much of a match.

3. It seems Guinn himself was skeptical of any conclusions based on only three elements. In 1970, Forensic Neutron Activation Analysis of Bullet Lead Specimens, a report prepared by Guinn and three other scientists for the Atomic Energy Commission, concluded "two bullets with the same pattern of only three identification points are not usually definitively identified as having a common source, Matching concentrations of all three elements does not indicate that two bullets came from the same lot." Since the FBI began using seven elements 20 years later, and since it was necessary for a bullet to match on all three elements tested up until that time, and all seven elements afterwards, before the FBI would even find that a bullet *was likely to have come from the same box* as another bullet, it seems clear that, due to the problems with copper, at no time in its history would the FBI have testified that the wrist fragments and the magic bullet matched. In fact, when given the opportunity to do so, in 1964, without even testing copper, the FBI ruled their tests inconclusive and kept them from the public. The question then is not only why Guinn testified in the manner he testified, in contradiction to his previous reports and the accepted standards of the FBI, but whether the FBI was deliberately removed from the process.

Should one suspect I'm exaggerating the vast divide between Guinn's methodology and that of the FBI's crime lab, one need but read The Basis for Compositional Lead Comparisons, an article by Charles Peters of the FBI's Materials Analysis Unit, published in the July, 2002 issue of Forensic

Science Communications, and available on the FBI's website. Peters explains: *"Years of analysis in the FBI Laboratory have demonstrated that the distinctiveness of a melt is defined not only by the number of elements measured but also by the relative scarcity of other alloys in that melt. Not all measured elements are equally effective at discriminating among lead sources, however. In general, for most lead products, the relative source discrimination power of the measured elements decreases in the following order: copper, arsenic, antimony, bismuth, and silver (Peele et al. 1991). Tin is not included in this list because in many lead sources it is not present at detectable levels. However, when tin is present, it provides excellent discrimination among melts of lead. Antimony, specified by the ammunition manufacturers, is alloyed with lead in order to harden the bullets. The other elements are present in trace amounts and can vary from one product to another."* Note that Peters considers both copper, which Guinn found did not match, and arsenic, which Guinn inexplicably failed to test, more reliable indicators than antimony, which Guinn upheld as the only element that mattered. From this it seems clear that, should they have been forced to testify, and encouraged to tell the truth, the FBI's crime lab employees would have told the HSCA that the stretcher bullet and wrist fragments did not match, and that the single-bullet theory, which their former Director J. Edgar Hoover never believed anyhow, was bunkum. This brings us back to the question of why Guinn and Guinn alone was called.

Arsenic Poisoning

Should one think I'm being a nit-picker, and assume that Guinn had found his own reasons not to trust arsenic as an indicator, and his own reasons to think a single true match was sufficient to pronounce that two fragments were highly probable to have come from the same bullet, let alone the same source, one should read the words of Guinn himself. The bulk of the tests described in Guinn's 1970 report to the AEC were for antimony, copper, and arsenic. Although antimony and copper were found in much more consistent numbers from lot to lot, and box to box, of the same type bullets tested, than arsenic, making arsenic the least reliable, there was no call that arsenic be dropped. In *Chemistry and Crime*, an anthology published by the American Chemical Society in 1983, moreover, Guinn claimed that *"small samples of bullet lead can be analyzed rapidly, quantitatively, and non-destructively for their concentrations of antimony, silver, copper, arsenic, and sometimes tin."* He then explained that antimony, silver, and copper can be tested via a rapid screening method, but that the test for tin takes slightly longer, and the test for arsenic even longer. He then declared *"if the rapid screening procedure reveals marked differences in the elemental composition (antimony, silver, and copper concentrations) of two bullet lead samples (e.g. a sample from a fatal bullet, and one from a cartridge found in the possession of a suspect) it is apparent they were not produced from the same homogeneous melt of lead, and hence, no further analysis is necessary. If, however, the two samples being compared are analytically indistinguishable from one another in their antimony, silver, and copper concentrations, it is desirable to also compare them via their **arsenic** concentrations by using the longer procedure to provide four points of comparison instead of just three. In crucial cases, it is even worthwhile to use a third (intermediate) INAA procedure, in an effort to detect and measure a fifth element, tin."*

Well, hell, seeing as neither arsenic nor tin were (at least officially) tested, are we to assume that Guinn didn't consider the murder of a president a crucial case?

And it's not as if this was the only time Guinn touted the benefits of arsenic...

In *Activation Analysis Vol.2*, published 1990, the arsenic poisoning of Guinn's credibility approaches a lethal dose. While discussing the best way to test bullet lead, he proposed that one first test his three favorites (antimony, silver, and copper). He then declared: *"If this fast method clearly shows that none of the victim specimens match any of the specimens associated with a suspect, in elemental composition, no further analyses are needed. However, if one or more of the victim specimens appears*

to match one or more of the suspect samples, an additional analysis is called for...to add a fourth element (AS-arsenic) to the comparison." He then discussed other elements that can be tested, including tin. Later, in this chapter, Guinn trumpeted that his bullet lead testing procedures had *"been used to advantage in many hundreds of criminal cases...including some very well known cases (e.g. the President John F. Kennedy assassination)."*

Sorry, but I have to ask--to whose advantage, exactly?

In Nuclear Analytical Methods in the Life Sciences, published 1991, moreover, Guinn once again pushed arsenic and tin. There, he asserted: *"Applications of the NAA method in the field of forensic chemistry--such as the detection of primer gunshot residue (detecting barium and antimony), and the analysis of evidence specimens of bullet lead and shotshell pellets (for antimony, arsenic, silver, copper, and tin)--are special to the author and used on a large scale in the investigation of gunshot homicide criminal cases, especially by the FBI Laboratory. In 1977, as part of the reinvestigation of the President Kennedy assassination, the author's reanalysis of all the bullet-lead evidence specimens, by INAA, produced decisive results."*

So, should we assume that in 1978, when Guinn testified before the HSCA, he just didn't have the appreciation for the importance of arsenic and tin he would later develop?

When asked if there were other elements found in bullets beyond antimony, silver, and copper, after all, he'd testified: *"Well, many times in bullets, under the conditions that we normally use, you will just see those three. Very often, unless you very carefully clean them, you will find a little bit of sodium and a little bit of chlorine, coming from salt, which may be from perspiration if anybody has handled the specimens, or salt spray in the air if it is anywhere near the ocean, for example. Often you will find a little trace of manganese... The main reason for using the activation analysis method is that it is an extremely sensitive method. it will detect very small concentrations, but it doesn't have the same sensitivity for all elements. Some are far more sensitive than others. So we sometimes see a little manganese, occasionally a little aluminum, once in a while some arsenic or tin. That about covers all of the elements that we have ever seen in all bullet leads."*

"Once in a while some arsenic or tin..." Was Guinn deliberately downplaying the importance of arsenic? Or did he simply not see it as important?

If so, it's hard to see how. Guinn had tested arsenic as far back as the 1960's. An article in the May 2004 issue of Analytical Chemistry credits him with pioneering its use. Forensic Neutron Activation Analysis of Bullet Lead Specimens, the 1970 report co-written by Guinn describing his tests for antimony, arsenic, and copper in bullet lead, had suggested that more elements be added into the mix, not that arsenic be dropped. In Application for Nuclear Science in Crime Investigation, a paper written for the Annual Review of Nuclear Science in 1974, moreover, Guinn was still presenting tests for antimony, arsenic, and copper as the usual procedure.

So what happened?

Well, in Chemistry and Crime, 1983, Guinn explained that while the FBI still used the longer procedure he'd helped pioneer, and tested antimony, arsenic, and copper, he now preferred a rapid-screening procedure for antimony, silver and copper. He then explained why he dropped arsenic from the big three. He declared *"many samples are too low in arsenic for very precise measurement."* But he didn't stop there. He then admitted *"that bullet fragments and samples taken from mashed bullets often have bits of copper jacket imbedded or buried in them (if the bullet was a copper jacketed bullet), thus resulting in spuriously high copper concentrations. Of course, such jacket contamination of the sample also produces erroneously high copper values in the rapid-screening INAA procedure. Whenever such useless copper values are encountered, the longer INAA procedure reduces to just two elements*

(antimony and arsenic, if the arsenic concentration is high enough) and the rapid-screening INAA procedure also reduces to just two useful elements (antimony and silver). In such cases of copper contamination, it is especially desirable to use both INAA procedures to determine a possible total of three useful comparison elements (antimony, silver, and arsenic)."

Well, that's as good as a confession, don't you think? Guinn knew full well he based his conclusions regarding the assassination on two elements, and yet here he is admitting to his colleagues that he really needed to test another element--arsenic--before coming to such a conclusion.

So why didn't he test it?

Hmmm. In Guinn's chapter in Activation Analysis Vol. 2, he spelled out that the content of bullet lead impurities normally ranges from 1 to 100 ppm for silver, 1 to 1500 ppm for copper, 1 to 2000 ppm for tin, and 1 to 2500 ppm for arsenic. This suggests that the likelihood of random matches for arsenic and tin was much less than the likelihood of random matches for silver, and slightly less than copper. (The levels of copper in the stretcher bullet and wrist fragment, of course, didn't match). This, of course, but strengthens my suspicion Guinn tested arsenic and perhaps even tin, but didn't like his results, and flushed them down the memory hole. While ultimately bragging that his tests produced "decisive results," Guinn didn't, after all, tell us what decision these results helped produce.

Of Alchemists and Liars

But that's being snotty. While I'd like to have left it at that, I have discovered a number of other reasons to distrust Guinn, which I would be remiss not to mention. In Chemistry and Crime, for starters, he not only discussed his testing of the fatal fragments, he provided his readers some background on the assassination and his role in solving the crime...and was totally deceptive in doing so...

For example, after stating that Oswald killed Kennedy and Tippit as a fact, Guinn further revealed his bias by claiming "The consensus of opinion among witnesses was that three rifle shots emanated from that room (NOTE: he means the 6th floor of the depository) when the President and Texas Governor John Connally were hit." This, of course, was nonsense. While some thought some shots came from the general direction of the depository, very few could identify what room the shots came from, let alone form an opinion as to whether all three shots came from there.

He then discussed the Warren Commission, and his work with the HSCA. While doing so, however, he overstated the case by claiming that his testing of the bullet fragments clearly revealed the presence of two and only two bullets. He based this on the fact that the mean or average values of the brain and limo fragments tested were "markedly lower" in antimony than the average values of the magic bullet and wrist fragment (622 vs. 815), and "somewhat lower" in silver (8.07 vs. 9.3).

This last point caught me by surprise. Guinn's HSCA testimony and report reflect that the magic bullet and wrist fragment were measured at 7.9 ppm and 9.8 ppm silver, respectively. That's a mean of 8.85, not 9.3. This led me to take another look at the April 1979 article in Analytical Chemistry in which Guinn first reported his results to the public. Here he claimed the magic bullet was measured at 8.8 ppm silver (plus or minus 0.5 ppm). Well, that explained the 9.3. But how in the heck did 7.9 (plus or minus 1.4) ppm silver in September 1978 become 8.8 (plus or minus 0.5) ppm silver in April 1979? I then noticed a footnote in Guinn's 1978 report at the bottom of Appendix B, where he presented his findings. It explained that silver and aluminum were measured twice for each sample, and that the uncertainty measurements for the test of these elements--which were more than twice as large for the magic bullet (plus or minus 1.4 ppm) than any other sample--reflected either the standard deviation taken from the counting statistics (a number obtained from a formula estimating the accuracy of the test) or "the spread of the two values," whichever was larger. Well, hell, this suggested that one of the

two measurements for silver on the magic bullet was even lower than the 7.9 ppm Guinn reported, possibly much lower.

Heck... if I'm understanding this correctly Guinn's measurement of 7.9 ppm silver (plus or minus 1.4 ppm) for the magic bullet meant that his actual measurements were 9.3 ppm and 6.5 ppm, and that he'd averaged them out, and assumed the distance to his actual results was the range. If so, well then it seems likely that his measurement of 9.8 ppm silver (plus or minus 0.5 ppm) for the wrist fragment means that his actual results were 10.3 and 9.3. If this is true, however, it means that Guinn knew that the silver value for the magic bullet may actually have been a bit smaller than 6.5 ppm (when one subtracted the standard deviation taken from the counting statistics) and that the silver value for the wrist fragment may actually have been a bit larger than 10.3 ppm. Well, then, no wonder he ignored the counting statistics! No wonder he measured his samples twice and averaged them out! As shown on the slide above, there is no way anyone can consider a silver value of 10.3 ppm a match for a silver value of 6.5 ppm. As more than half the Mannlicher-Carcano ammunition samples tested fell within this range, it is at best inconclusive. If the test for silver was inconclusive, of course, Guinn had little choice beyond admitting that there was insufficient evidence to claim the magic bullet and wrist fragments matched. Perhaps then this was why Guinn reconfigured this number months later, and changed a 7.9 into an 8.8... Perhaps he'd realized that if he'd presented the measurement for silver as 7.9 (plus or minus 1.4 ppm), questions might arise in the minds of his fellow scientists. A wrist fragment measurement of 7.9 ppm silver, after all, would suggest that the wrist fragment and magic bullet were closer in composition to the brain and limo fragments than they actually were to each other. And this, in turn, would pretty much sink Guinn's claim that his tests revealed two readily distinguishable bullets.

So why not just change a number or two? I mean, if you're gonna fudge your numbers you might as well make it a good fudge.

Guinn's treatment of the copper test in Chemistry and Crime was even more curious. While acknowledging that the wrist fragment had far more copper than the other fragments, he claimed this indicated it was *"probably contaminated with imbedded copper jacket material,"* and that this invalidated the test. He discusses this on pages 74-75. Well, on pages 70-71, he claims that in the FBI Laboratory specimens *"are examined under magnification to ascertain whether there is any visible evidence of adhering jacket material. If there is, one attempts to remove the jacket material with a surgical scalpel."* He then proceeds *"In our laboratory, such samples are then further processed by immersing each sample in concentrated nitric acid for 10 minutes at room temperature. This procedure will dissolve away any specks of adhering jacket material without dissolving any measurable amount of the lead material. However, even this acid treatment procedure fails if there are jacket particles completely imbedded in the lead and inaccessible to attack by the nitric acid."* Now, the largest wrist fragment, the only one tested, was tiny, only 16.4 mg. (It would take 632 fragments of this size to make a 160 grain bullet like the one purportedly killing Kennedy.) This tiny fragment, moreover, supposedly fell from the bullet as it traversed Connally's wrist. There was no copper missing, at least that anyone described, from the tail end of the bullet. So how, presuming Guinn actually performed the inspection described both above and in his September 1978 report to the HSCA, did copper get "imbedded" within the lead of this tiny fragment?

Well, on page 76 he offers up a theory. Sort of. Basically, he throws out a little fact (which turns out not to be a fact) which those reading his chapter can then use to make sense of the copper mystery. He writes that the so-called magic bullet *"left no particles along the wound track in either the President or the Governor, and hence was not damaged (even though it broke one of the Governor's ribs with a glancing blow) until it struck the Governor's right wrist. Here, it suffered a dent in its nose and lost about 1% of its lead."* Yep, he proposed, albeit in a roundabout way, that the copper imbedded in the wrist fragment came from the nose of the so-called magic bullet. Well, there's two problems with this:

1) the dent on the bullet nose was created by the FBI subsequent to the shooting, and 2) he knew the lead in the wrist fragment came from the back of the bullet. Yes, when asked in his HSCA testimony if it was his testimony that the magic bullet and wrist fragments came from the same bullet, he testified *"Yes. One, of course, is almost a complete bullet so it means that the (wrist) fragments came from, in this case, the base of the bullet."*

SO...my gosh, it appears from this that Guinn was trying to sell that a nearly pristine bullet hit Connally's wrist, and lost some copper from its nose, and that this copper then somehow got imbedded within a tiny speck of lead squeezed from the base of the bullet upon impact, so much so that the copper was imperceptible to the human eye... even under magnification. Yeah, okay... We have a magic bullet and now we have a magic fragment from this bullet.

Let's note here that in Chemistry and Crime Guinn admitted that he'd studied Mannlicher-Carcano bullet lead even before being hired by the HSCA, and that he'd found the range of copper among this lead to be from 10 to 370 ppm. Let's note as well that in Activation Analysis Vol. 2, he admitted that he'd studied the lead of other bullets as well, and had found the range for copper to be between 1 and 1500 ppm. Now, let's recall that the wrist fragment was 994 ppm copper. This means that Guinn knew, as soon as he'd performed his test, that he'd PROVED the wrist fragment did not derive from the magic bullet, or any other bullet fired from Oswald's rifle, and that the single-bullet and single-assassin theories he'd clearly subscribed to were thereby kaput...UNLESS he could find some reason--any reason--to invalidate his own test.

Well, the quickest way to do that was to claim jacket material had thrown off his count for copper. So far, so good. But there was no copper missing, as far as could be determined, from the base of the bullet. Well, that's okay, there was a dent on the bullet nose; perhaps it came from there. Only the FBI admitted they'd made the mark on the nose while performing spectrographic tests in the FBI Crime Lab...

Now, is it reasonable to assume Guinn didn't know this? I don't think so. It seems hard to believe that in his many discussions with the HSCA he would never have inquired about the nick on the bullet nose, and have been informed it had been created by the FBI.

Well, then, is it possible he just...lied? Yes, I now think so. The final paragraph of Guinn's chapter in Chemistry and Crime reads not like the conclusions of a serious scientist, but the bragging of a politician. He writes: *"My findings, of course, neither prove nor disprove the various conspiracy speculations, such as someone, in addition to Oswald, firing from some other location such as the 'grassy knoll.' They do show that if any other persons were firing, they did not hit anyone or anything in the President's limousine."*

Now, this, of course, is nonsense. Even if one accepts Guinn's analysis of the bullet fragments, his findings "showed" no such thing. But he didn't stop there. In 1986, in sworn testimony taken as part of a televised mock trial, Guinn actually repeated this nonsense. When asked by his fellow Vincent, Bugliosi, *"What you're saying is that from your neutron activation analysis, there may have been fifty people firing at President Kennedy that day--is that correct--but if there were, they all missed--ONLY bullets from Oswald's Carcano rifle hit the President--is that correct?"* Guinn eagerly responded *"That's a correct statement, yes!"*

Well, I'll be! Could he really have forgotten he'd found no evidence suggesting the magic bullet had created Kennedy's back wound? Or throat wound? Could he really have forgotten that at least one of the bullets was never found? Well, then, how could he claim that tests never performed on this bullet *proved* it hadn't hit Kennedy, or anything else in the limo for that matter?

He couldn't, and what's worse, he *knew* he couldn't. Here is how he summed up his findings in

Analytical Chemistry, written but 4 years before Guinn wrote his chapter in Chemistry and Crime, and 7 years before he testified in the mock trial: *"The new results can not prove the Warren Commission's theory that the stretcher bullet is the one that caused the President's back wound and all of the Governor's wounds, but the results are indeed consistent with this theory."*

And here is how Guinn testified before the HSCA, only 8 years before he testified in the mock trial: *"These results only show that the CE 399 'pristine' bullet, or so-called stretcher bullet, matches the fragments in his wrist. They give you no information whatsoever about whether that bullet first went through President Kennedy's body, since it left no track of fragments and, for that matter, it doesn't even say that it went through Governor Connally--through his back, that is--because it left no track of fragments there. At least I have never seen or heard of any recovered lead fragments from either of those wounds. The results merely say that the stretcher bullet matches the fragments in the wrist, and that indicates indeed that that particular bullet did fracture the wrist. It unfortunately can't tell you anything else because there were no other bits and pieces along the other wounds."*

Guinn had completely reversed himself for the mock trial!

And this wasn't the only point on which Guinn's mock trial testimony was suspect. Upon cross-examination, Oswald's defense attorney Gerry Spence pointed out that there were at least thirty bullet fragments in Kennedy's head, and that Guinn had examined but two. He thereby raised the possibility that, in opposition to what Guinn had just told Bugliosi, another bullet was involved. When then asked by Spence if he knew the composition of the fragments he'd never examined, Guinn testily replied "Yes!" When then asked if he'd actually tested these fragments, Guinn fought back, showing what one assumes were his true colors. He snapped *"No, but I know what they are!"*

Well, how could he know that? And, what's more, what kind of scientist would claim, in a court of law, (even a mock court of law) that he knows the results of tests he'd never conducted?

This suggests to me that Guinn knowingly misrepresented his test results to the HSCA, knew it was only a matter of time before his fellow scientists caught on, and attempted to obfuscate the issue by further misrepresenting the case for a single-assassin in articles like the one in Analytical Chemistry, in books such as Chemistry and Crime, and in public appearances like his testimony in the 1986 mock trial.

Guinn v Guinn

But that's just me. Now, has any expert on bullet lead analysis supported this conclusion? No, not directly. There is one expert on the subject, however, whose writings demonstrate beyond any doubt that Dr. Guinn's conclusions were inappropriate, and far beyond what was warranted. And that expert, as you no doubt have figured out, is Dr. Guinn himself.

When asked during his 9-8-78 HSCA testimony the degree of certainty he'd attached to his conclusion the Connally wrist fragment derived from the magic bullet, that is, whether he felt it was merely more probable than not or highly probable, after all, Dr. Guinn testified: *"I would say **highly probable**, yes. I would not want to say how high, whether it was 99 percent or 90 percent or 99.9 percent. I can't make a calculation like that."*

Hmmm... Well, what are we to make of this? He wouldn't give a number, but said it was "**highly probable**." Was this a deliberate use of the term?

Yes, sure enough, in the final paragraph of his final report on the fragments, entered into evidence

during his testimony, and published on page 533 of HSCA Appendix Vol. 1, Guinn uses the term again. Here, he asserts: *"It is **highly probable** that the specimen tested from Q1 (the stretcher bullet) and the specimen tested from Q9 (the wrist fragment) came from the same bullet."*

So, make no mistake about it, here was a man of science throwing the full weight of his expertise behind his conclusion the stretcher (or magic) bullet and wrist fragment were one.

Now look at how he handled this issue in Chemistry and Crime five years later. He admits: *"Because of an inadequate background file of bullet-lead compositions and for other reasons, it is not possible to make an accurate calculation of the mathematical probability that two scientifically indistinguishable bullet-lead samples were produced from the same homogenous melt of lead. Instead one must resort to more qualitative expressions, such as 'probably' (if only three elements were measured), 'very probably' (if four elements were measured), or '**highly probable**' (if five elements were measured). Depending in individual cases on how relatively common or uncommon the observed concentrations are (among the whole population of bullet leads) and on how accurately and precisely each concentration was measured, these three qualitative expressions of probability of a common melt origin may correspond, respectively, to probabilities to the order of 99, 99.9, and 99.99%."*

Yes, you got it. While Guinn used the term "**highly probable**" in his HSCA testimony, and implied that this term could be used to describe a 90% probability that two samples having two matches, antimony and silver, came from the same bullet, he later reserved the term "**highly probable**" for the 99.99% probability that two samples having five matches came from the same melt.

Now look at how he backs this up in Activation Analysis, Vol. 2, published 1991. He now claimed: *"If one is to conclude that two BL (bullet lead) or SSP specimens "match" one another to the extent that, to a high degree of probability, they had a common lead-melt origin, they must "match" one another in their concentrations of each of a number of elements measured to a respectable precision, and not exhibit any significant mismatches... For a variety of reasons, it is presently not possible to calculate a numerical probability that any two specimens had a common lead-melt origin. Instead, assuming that they do not mismatch in any element, but only match one another in one or two measured elements, one usually merely states that they might have had a common origin; with three matching elements, that they probably had a common origin; and with four, five, or six matching elements, that there is a **very high probability** (approaching "certainty") that they had a common origin."*

So, ask yourself, is it a coincidence that Guinn testified that the apparent match between the wrist fragment and magic bullet on two elements made it "**highly probable**" they came from the same bullet, when he later claimed such a match meant merely that they "might" have come from the same melt, and reserved the term "**highly probable**" for samples matching on four or more elements?

I think not. In Neutron Activation Analysis in Scientific Crime Investigation, a 1990 paper by Guinn found on the International Atomic Energy Agency website, he noted that a one ton melt of lead can be made into 1,870 boxes of 50 bullets each, or 93,400 bullets. And this was chicken-feed. A May 2004 article by Wilder Smith in Analytical Chemistry notes further that a compositionally indistinguishable volume of lead can be used to make 12 thousand bullets, on the low end, and 35 million, on the high. How can Guinn have claimed, then, that it's "**highly probable**" two samples matching on two elements in the Kennedy case are the exact same bullet, when he elsewhere said the most one can say about two samples matching on two elements is that they "might" be from the same batch of 93,400 bullets, or more? I mean, who was he trying to fool?

Apparently everyone. Not only had Guinn become far more conservative in his use of the term "**highly probable**" after his HSCA testimony, he'd become much more liberal with its use for his testimony. After conducting his first series of tests in 1970, using antimony, copper, and arsenic, Guinn claimed that although *"matching concentrations of all three elements does not indicate that two bullets came*

from the same lot" "a significant difference in concentration in any one of the three elements...indicates that they came from different lots."

Yes, Guinn was, at least initially, convinced his tests were far better at showing two specimens did not match, than match. Here is how he summed it up in the Annual Review of Nuclear Science in 1974, just three years before he conducted his tests for the HSCA: *"the antimony concentration itself proves to be a fairly effective means of deciding whether two specimens of bullet lead do not have a common origin. Measurements of the levels of a few additional elements that can be detected, e.g. aluminum, copper, arsenic, silver, tin, can lead to at best only a moderately strong probability of common origin...The purely instrumental NAA approach can readily indicate two specimens do not have a common origin, but it cannot yet establish **very high probabilities** of common origin."*

So what changed? Did Guinn make some major break-through just prior to his HSCA testimony?

Not that I've discovered... No, it appears instead that *Guinn* changed. Had Guinn's 1977-era methodology have been far superior to previously methodology, after all, he wouldn't have said the FBI had been mistaken when they claimed their 1964 test results were inconclusive, and he wouldn't have presented their results as support for his conclusions. But he did...

This leads me to conclude, then, that it's **highly probable** Dr. Vincent Guinn deliberately skewed his conclusions to support the single-bullet theory during his 1978 HSCA testimony, and that he deliberately lied about it afterward.

And it's not as if his misuse of the term "highly probable" was just an unfortunate turn-of-phrase, with no repercussions. Dozens if not hundreds of books, starting with the HSCA's 1979 report, were tainted by it--some to near comical effect... In 1998's *Live By The Sword*, for example, Oswald-did-it-for-Castro theorist Gus Russo relates *"Using a technique known as neutron activation analysis, the HSCA received supporting testimony from Dr. Vincent Guinn, one of the country's top experts in the field of neutron activation. Although at the time Guinn would use only the words "highly probable," he later published two articles in which he makes it clear that by "highly probable" he meant a "99.99% probable."*

Yes, you read that right. Russo got it backward. He realized that Guinn claimed "highly probable" in his testimony, and later specified that "highly probable" meant 99.9%, but failed to realize, or at least acknowledge, that Guinn's definition of "highly probable" changed along the way, and that the match for antimony described in his testimony could no longer be taken to mean it was "highly probable" these samples came from the same source.

Of course, I'm skeptical Guinn ever *honestly* believed these odds were "highly probable"...

But that's me. Should the reader wish to think better of this learned man of letters, (Guinn, not Russo) and give him the benefit of the doubt, well, then, let us conjure up an explanation for at least some of his mistakes -- one that moves him from the category of deliberate liar to mere screw-up. In their early tests of bullet lead, Guinn and others discovered there was an apparent conformity between bullets in the same box, and sought to find practical applications for their discovery. Over time, the courts came to accept the value of bullet lead analysis and the FBI began testifying that one bullet most probably came from the same box as another. This allowed prosecutors to convict suspects even when no gun was found. The problem, as outlined by William Tobin and the National Academy of Sciences, was that little research was done on how bullets were actually made and distributed, and that, when one studied these things, one could only conclude that virtually indistinguishable bullets were likely to end up in boxes of ammunition on opposite sides of the country. In his research on Mannlicher-Carcano ammunition, however, Guinn found that the bullets within the same box had *no apparent conformity*. This led him to believe that the slight conformity between the wrist fragment and the magic bullet had

significance, as other bullets from its box would be unlikely to match on antimony. The problem was that there was NO REASON to assume the wrist fragment bullet came from the same box as the magic bullet. Quite literally, then, Guinn was thinking inside the box when he should have been thinking outside the box!

Or maybe he was lying. All I know for sure is that his testimony regarding the magic bullet and wrist fragment was inaccurate. In July, 2006, Drs Erik Randich and Patrick Grant published an article in the Journal of Forensic Sciences, describing a study they'd conducted with the help of Tom Pinkston. They used cross-sections of bullets to demonstrate that antimony concentrations were not standard throughout bullet lead, even within the same bullet, and that one would have to have used samples far larger than those used by Guinn before coming to any conclusions whether or not a fragment could have come from the same bullet as another fragment. They also found that other full-metal jacketed ammunition contained similar levels of antimony as the ammunition fired in Oswald's rifle. Their conclusion reads: *"We therefore assert that, from our perspectives of standard metallurgical practice and statistical assessment of the fundamental NAA measurements a conclusion of material evidence for only two bullets in the questioned JFK assassination specimens has no forensic basis. Although collateral information from the overall investigation might very well narrow the choices, as stand-alone primary evidence, the recovered bullet fragments could be reflective of anywhere between two and five different rounds fired in Dealey Plaza on that day. Only the near-complete mass of CE-399, the stretcher bullet, precludes the conclusion of one to five rounds. Moreover, the fragments need not necessarily have originated from MC ammunition. Indeed, the antimony compositions of the evidentiary specimens are consistent with any number of jacketed ammunitions containing hardened lead."*

In May, 2007, a similar article by Spiegleman, Tobin et al in the Annals of Applied Statistics confirmed Randich and Grant's conclusions, and disclosed that they had repeated Guinn's tests on random Mannlicher-Carcano bullets. Not surprisingly, given Guinn's results, they'd found that one of the thirty random bullets used in their study was a close match to one of the assassination fragments. This news even made the Washington Post.

And SO... in my estimation, one has a choice: the tests on the fragments performed by Guinn were either: 1) incorrectly interpreted, (as they actually showed the likelihood of more than one shooter); 2) of little scientific value; or 3) BOTH incorrectly interpreted and of little scientific value. No matter what, however, one thing is clear: the tests did not do what single-bullet theorists claim they did (prove the magic bullet passed through Connally's wrist).

The Clean-up Crew

Above: two photos of the limousine at Parkland, with the never-officially explained clean-up bucket by the left rear tire. Back-up car driver Sam Kinney is bent into the back seat in the photo at left. George Hickey is at his right.

At left and at right: Warren Commission Exhibits CE 352 and CE 353, respectively. These photos were taken the day after the assassination by the FBI. Note that there were NO bullet fragments of any kind discovered on the back seat.

The Clean-up Crew

Should one doubt the “magic” bullet could have come from anywhere but Connally’s leg, moreover, one should consider that the bullet, had it fallen from Kennedy’s back as originally believed, would most likely have fallen out in the limousine, and that the limousine was cleaned up while sitting outside Parkland Hospital in Dallas by two Secret Service Agents, Sam Kinney and George Hickey.

Although William Manchester, in his book *The Death of a President*, disputed that such a clean-up occurred, citing a nurse who says she was asked to bring the agents a bucket of water but failed to deliver it, Manchester overlooked the statement of an orderly, Joe Lewis Richards, admitting that he did indeed bring them the bucket.

And we know this bucket was used because...

- An 11-22-63 UPI article, most likely reflecting the words of UPI’s man-on-the-scene Merriman Smith, reported on this clean-up, stating: “*Outside the hospital, blood was cleaned from the limousine.*”
- An 11-23-63 New York Times story by Tom Wicker similarly reported, “*A bucket of water stood by the car, suggesting that the back seat had been scrubbed out.*” (In his 1978 book *On Press*, Wicker would specify that it was “*a bucket of bloody water.*”)
- An article on the assassination by Hugh Sidey in the 12-20-63 issue of Time Magazine confirmed these accounts, and described his witnessing “*A young man, I assume he was a Secret Service man, with a sponge and a bucket of red water, and he was trying to wipe up the blood and what looked like flakes of flesh and brains in the back seat.*”
- And as if that weren’t enough, Newsweek’s Charles Roberts also confirmed these accounts. In

his 1967 defense of the Warren Report, modestly entitled "The Truth About The Assassination," Roberts said simply that on 11-22-63 he saw two Secret Service men *"starting to put the fabric top"* on the President's limo, and thought *"Why now?"* He would later expand on this, however. In an interview conducted for Robert MacNeil's 1988 book *The Way we Were*, Roberts admitted that he'd actually seen these agents *"mop up the back seat"* before putting on the fabric top, and that he'd thought it *"ironic"* that one of the Secret Service agents waved him aside and told him *"you can't look,"* when *"this wall of protection...of course could do no good."*

Thus, four respected newsmen, all verified to have been at Parkland Hospital on 11-22-63, claimed they saw either someone cleaning blood from the limo, or the bloody bucket used in this clean-up.

And they weren't alone. In the decades following the assassination, White House photographer Cecil Stoughton, Associated Press photographer Henry Burroughs, and ambulance driver Aubrey Rike added their names to the list of those witnessing this clean-up. In 1983, *Life Magazine*--not exactly a propagator of conspiracy theories--published a photo taken by Stoughton of a bucket beside the limo with the caption *"Outside Parkland, agents clean the bloody limousine."* In Richard Trask's 1994 book *Pictures of the Pain*, moreover, a number of similar photographs were published, all taken by Stoughton, and all showing a bucket by the limousine.

The evidence for the Secret Service clean-up of the limo is so convincing, in fact, that in 2003 the Fox News Channel asserted that a clean-up had occurred and broadcast footage of a Secret Service Agent, possibly George Hickey, walking away from the limousine with the bucket. That same week, a former member of the President's Secret Service detail in Dallas, Gerald O'Rourke, came forward, telling the *Rocky Mountain News* *"that on the day of the assassination, one agent was ordered to clean out the cars used in the motorcade, getting rid of blood and other evidence."* (He implied this was Sam Kinney.) By 2008, the once-disputed clean-up of the limo had become so widely accepted that even the Discovery Channel, in a program pushing that Oswald acted alone, by gosh, discussed the clean-up as an established fact.

Yes, it's conclusive, accepted even by defenders of the Warren Commission: the Secret Service, if only briefly, cleaned-up the limo while it was sitting outside Parkland.

Should one doubt that this clean-up destroyed or removed evidence, moreover, one should reflect that Warren Commission Exhibit CE 840 consists of all the bullet fragments found in the car beyond the two large fragments found in the front seat, and comprises but three small fragments found in the carpet *beneath Nellie Connally's seat, several feet to the left of the presumed trajectory of the bullet.* That there were no bullet fragments found on the floor by Kennedy's or John Connally's seats or on the seats themselves is undoubtedly suspicious. Also suspicious is that one of the three fragments found beneath Nellie's seat disappeared from the archives at some point in the sixties. Adding to the likelihood that a Secret Service agent planted the bullet on the stretcher, perhaps simply to avoid admitting that he'd screwed up and cleaned-up important evidence (neither Kinney nor Hickey ever admitted that a clean-up occurred), is that one of the two men to find the stretcher bullet, Nathan Pool, told an HSCA investigator he saw a Secret Service agent standing near the stretcher just before the bullet was discovered.

While any theory explaining the appearance of this bullet on the stretcher is broad speculation, and any theory on the disappearance of an additional bullet (or bullets) during the movement of Connally onto the stretcher or the clean-up of the limousine is even broader speculation, I believe it is reasonable speculation, given the alternative. One of the truly laughable arguments made by the single-assassin theorist community is that since only two bullets were recovered, it is illogical to assume that more than two bullets inflicted the wounds. "Where's the third bullet?" they will ask. They forget that their theory holds that a bullet lodged in Connally's leg, became dislodged as his clothes were removed,

went unnoticed when he was moved to the operating table, stayed unnoticed when the sheets were folded up, stayed unnoticed when the stretcher was moved downstairs, and re-appeared an hour later when two stretchers collided, on a stretcher not fitting the description of Connally's stretcher, and a stretcher that the man "discovering" the bullet, Darrell Tomlinson, suspected was, in fact, *not* Connally's stretcher.

Even worse for those disputing the bullet was planted, researcher Josiah Thompson, building upon Darrell Tomlinson's suspicions, read through Parkland Hospital's records for 11-22-63, and found that the stretcher on which the bullet was found was almost certainly the stretcher of a young boy named Ronnie Fuller, who was admitted to the emergency room after suffering a cut. Thompson's research on this issue has never been countered.

In fact, he's continued to build upon it. At the 2003 Wecht Conference held at Duquesne University, Thompson showed how the only Parkland employees to see the bullet found by Tomlinson on 11-22 believed the bullet had a pointed tip. CE 399 has a rounded tip. Thompson also discussed the strange fact that both Governor Connally and Dallas District Attorney Henry Wade were of the impression a bullet was found in Connally's operating room. While these differing recollections could have come from the passage of time, and the resulting confusion, he related another tale that's much harder to explain. This tale sprang from an interview of Parkland's Director of Nursing, Elizabeth Wright. In this interview, conducted by researcher Wallace Milam in 1993, the former Mrs. Wright related that there was more than one bullet found on stretchers in the days after the assassination, and that this led one of the nursing supervisors, Doris Nelson, to complain: *"I wish they would stop putting bullets on these stretchers."* If the bullet found by Tomlinson did not look like CE 399, and other bullets were found afterwards, of course, it is entirely possible CE 399 was found at Parkland sometime later in the evening, after Oswald's rifle had been retrieved by the Dallas Police.

If this, in fact, occurred, then it only follows that the bullet found by Tomlinson was made to disappear. And if the bullet found by Tomlinson was made to disappear, then it only follows that any other bullets or fragments found at Parkland were made to disappear.

Fortunately, we need not drive down this particular conspiracy road, as a less-conspiracy-oriented answer to the "Where's the third bullet" question is also available. It goes like this...IT...GOT...LOST. The FBI and Secret Service certainly believed as much. Their official reports on the shooting concluded that all three shots hit Kennedy and Connally, even though only one and a half bullets had been retrieved; the FBI's report even specified that CE 399 fell from Kennedy's back. Apparently, neither agency had any problem believing that the bullet striking Connally, the third bullet, had gotten lost in the Parkland shuffle.

For this conclusion, they had plenty of support. In his 1970 book, *Legal Medicine*, the Clark Panel's Dr. Alan Moritz offered that *"Often a bullet that has had sufficient velocity to pass through the body will be so nearly spent that it will fail to penetrate the head covering or clothing at the site of exit. Unless the doctor, nurse, or accident ward attendant is alert to this possibility, such a bullet may be lost."* Elsewhere, Dr. Moritz explained that *"Years of medicolegal experience in the investigation of firearm injuries confirm the truth of the generalization that the only things likely to be seen and remembered are those that are looked for with knowledge of their potential significance."* Those arguing that CE 399 created Connally's wounds and was found on his stretcher, and thus that the bullet had been overlooked by at least five nurses and hospital employees prior to its discovery, thereby inadvertently confirm that other bullets, potentially including the bullet that ACTUALLY created Connally's wounds, could have been lost in the madhouse that was Parkland Hospital on November 22, 1963.

Another top pathologist believed that it was just that simple--that the bullet had been lost. Dr. Milton Helpert, who'd supervised over 10,000 autopsies of gunshot victims in his long career, explained that,

clean-up or no clean-up, one can not always find the bullets involved in a homicide. Specific to the Kennedy assassination, in an interview for the book, *Where Death Delights*, he told former FBI man Marshall Houts: *"It is not unusual at all for spent bullets that have passed through a human body to become lost...If I had to venture a guess as to what happened to the bullet that wounded Governor Connally, I would suggest that it fell out of his pants leg while he was being removed from the car and placed on the stretcher; or it could have fallen out at any stage of his hospital experience."* He said it.

And the FBI's Robert Frazier, the man tasked with inspecting the limousine on the night of the assassination, apparently shared his belief this was possible. In 1995, undoubtedly as a response to the then-widespread criticism of the FBI crime lab, a book entitled *Hard Evidence* was published to help promote the FBI crime lab. This book, written by David Fisher, featured an interview with Frazier. When musing on the whereabouts of the still missing remnants of the bullet found in pieces on the front seat of the limousine, the carpet beneath Nellie Connally's seat, and in the President's skull, Frazier declared *"What happened, I think probably in the confusion when they got to the hospital, everybody jumped out of the car, and if there were lead fragments on their clothes or in their pockets or anywhere else, they fell on the ground and were just trampled on and that was the end of it."* While some might say that the likelihood of losing fragments in the chaos was significantly greater than that of losing a nearly-intact bullet, the bullet may have been in pieces and a nearly-intact bullet could easily have been picked up in the treads of a car tire. Sometimes things get lost.

But even if one should refuse to believe it got lost, there is the possibility that it simply was overlooked. On May 13, 1964, in testimony before the Warren Commission, Robert Frazier described his search of the limousine for bullet fragments late on the night of the shooting. Two bullet fragments had already been retrieved from the front seat by the Secret Service. First, Frazier described the car: "There were blood and particles of flesh scattered all over the hood, the windshield, in the front seat and all over the rear floor rugs, the jump seats, and over the rear seat, and down both sides of the side rails or tops of the doors of the car." Then Frazier described his search: "I examined the car to determine whether or not there were any bullet fragments present in it, embedded in the upholstery of the back of the front seat, or whether there were any impact areas which indicated that bullets or bullet fragments struck the inside of the car." At this point he found three small bullet fragments on the carpet under Nellie Connally's jump seat. By his finding these three fragments, and by his using the word "examine" to describe his search, Frazier gave the clear implication that he was extremely thorough in his search for bullet fragments.

When asked if he felt his search was indeed a "thorough examination of all aspects of the interior of the automobile," however, Frazier's response was not without its qualifications. He replied: "Yes, sir; *for our purpose*. However, we did not tear out all of the rugs on the floor, for instance. We examined the rugs carefully for holes, for bullet furroughs, for fragments. We examined the nap of the rug, in the actual nap of the rug, for fragments and bullet holes. We pulled the rug back as far as we could turn it back and even tore the glue or adhesive material loose around the cracks at the edges of the rug so we could observe the cracks to see whether they had been enlarged, and we examined all of the upholstery covering, on the back of the front seat, on the doors, and in the rear seat compartment, the jump seats, the actual rear seat, the back of the rear seat, and we examined the front seat in a similar manner, and we found no bullet holes or other bullet impact areas, other than the one on the inside of the windshield and the dent inside the windshield chrome." (5H58-74).

An 11-27-63 Secret Service report on this inspection, included in the Secret Service's report on the limo to the Warren Commission, CD80, confirms "a meticulous examination was made of the back seat of the car and the floor rug." But this wasn't exactly true.

In *Hard Evidence*, Frazier was more forthcoming about this examination. He revealed "The President's limousine arrived back in Washington about six o'clock. Around one o'clock the next morning, Cort

(Cortland Cunningham) and I started sifting through the blood looking for lead fragments. It was tough; it was very tough... We'd just reach down into the clots of blood and scoop it up in our hands and let it dribble through. Whenever we felt something gritty, we'd clean it up and if it was lead, we'd save it in a pillbox. We didn't really recover a lot of lead." Evidently, they never thought of sponging off the blood and inspecting the carpet with a metal detector and a magnifying glass.

In any event, according to the Secret Service's own report on the limo, CD80, by the afternoon of the 23rd a Secret Service agent was requesting permission to clean the rest of the blood from the back seat and floor of the limo. At this time, he was told to wait for FBI approval. The very next day he made a second request, this time noting "that the odor from the car was becoming offensive." This request, almost certainly made after the announcement of Oswald's death, was granted "after clearance from the FBI." Late that evening, the limousine was cleaned up. No FBI agent was present. According to the Secret Service's own records, "there were still fragments of bone and hair in the debris of the car which had not been removed by the FBI search team." There's no record of what became of this "bone and hair." There's no indication that this clean-up crew looked for small fragments of lead hidden amongst this bone and hair. A Ford Motor Company memo first obtained and reported by researcher Pamela McElwain-Brown, moreover, demonstrates that within 10 days of the shooting, the carpet of the limousine had been removed by "*the White House upholstery man*" and had been replaced by the writer of the memo, Ford Motor company employee Vaughn Ferguson. There's no record of what this "upholsterer" did with this carpet. There's no reason to believe that a thorough inspection of this carpet was ever undertaken.

And should one still have any doubts, and still cling to the notion that the bullet hitting Connally must have remained on his person or in the limousine, and could not possibly have been cleaned-up, stolen, lost or overlooked, there is this: there is at least one fragment that disappeared after the shooting. Yes, in 2010, with the release of *The Kennedy Detail*, Secret Service Agent Paul Landis related that after Kennedy and his wife were pulled from the limousine, he noticed a bullet fragment sitting on the back of the car by the headrest. He claimed he then put it on the seat. Well, you guessed it, no fragment was found on this seat. This, then, suggests this fragment was "cleaned up" in some manner, for one reason or another.

And should one STILL find the urge to claim "yeah but that was just a fragment," well, there's this: a piece of metal the size of a bullet also disappeared. Yes, Nellie Connally, in her 2003 memoir *From Love Field*, reported that a Mexican peso worn by her husband as a cuff link was shot off his wrist during the shooting and was never recovered. She reported that she had a bracelet made from the remaining cuff link, and wore it thereafter as a memento of her husband's close brush with death. It follows then that any explanation for what happened to this cuff link could apply to a bullet as well.

Chapter 12: The Single Bullet "Fact"

A look at more recent versions of the theory, and the misrepresentations used to support them

As Simple As 1-2-3

At left, Zapruder frame 188. Kennedy is waving to the crowd at his right.

Below, in middle, Zapruder frame 206. This is less than one second after frame 188. As Kennedy disappears behind the Stemmons Freeway sign he has suddenly stopped waving, has turned his head to his left, and has jerked his hand across his face. Notice the white cuff of his shirt.

At right, Zapruder frame 225, barely one second after frame 206. As Kennedy emerges from behind the sign, his right hand has dropped down from his face. It's clear he's been hit.

Now which makes more sense? That he was hit 1/18 of a second before this frame and had experienced a freakishly rapid reaction? Or that he was originally hit 2 seconds before, around frame 190? The HSCA concluded he was hit around 190.

For reasons beyond my grasp, the first image in each chapter sometimes fails to appear. If there's nothing up above, don't despair; you can still see the image [here](#)

As Simple As 1-2-3

While many believe the HSCA identified frame 190 of the Zapruder film as the first moment of impact based on a faulty understanding of a dictabelt recording, few realize that the HSCA's photographic panel studied the Zapruder film, and confirmed this conclusion.

A spokesman for the panel, Calvin S. McCamy, a former chairman of the American Society of Photogrammetry, testified before the committee on 9-12-78. His words make it more than clear the panel believed Kennedy turned to the left in reaction to a shot *before* Kennedy went behind the sign around frame 210 of the Zapruder film. When describing the film as Kennedy went behind the sign, he testified: *"There is considerable blurring at this point. The President's arm is up in a waving position. His head is still toward the right. At this point there is considerable blur, and by here, it appears as though his head is beginning to turn quite rapidly to the left. His head is now to the left. That is only one-eighteenth of a second from one frame to the next. He continues to look toward the left. One barely sees his right ear toward the camera. It is quite clear he is here now looking directly at his wife. He and his wife can be seen looking at one another in this sequence. He now goes behind the sign, and only a fraction of a second later we see his hands moving upward. He has a gasping expression. His*

hands are in a classic position of a person who has been startled. He now begins to raise his arms into what I would call a defensive position. He may be clutching at the throat wound."

The Panel's report was published in Volume 6 of the HSCA's 12 volumes. It reads, in part:

"(61) The Zapruder film was studied with care at each of the Panel's conferences..At the final conference, which took place in July 1978, the film was closely scrutinized by 20 photographic scientists who were either members of the Panel or contractors responsible for much of the committee's laboratory work (i.e. photographic enhancement, restoration, etc.)."

"(64) By a vote of 12 to 5, the Panel determined that President Kennedy first showed a reaction to some severe external stimulus by Zapruder frame 207, as he is seen going behind a sign that obstructed Zapruder's view."

(65) By a vote of 11 to 3, the Panel determined that Governor Connally first showed a reaction to some severe external stimulus by Zapruder frame 224, virtually immediately after he is seen emerging from behind the sign that obstructed Zapruder's view."

(70) At approximately Zapruder frame 200 , Kennedy's movements suddenly freeze; his right hand abruptly stops in the midst of a waving motion and his head moves rapidly from right to his left in the direction of his wife. Based on these movements, it appears that by the time the President goes behind the sign at frame 207 he is evidencing some kind of reaction to a severe external stimulus.

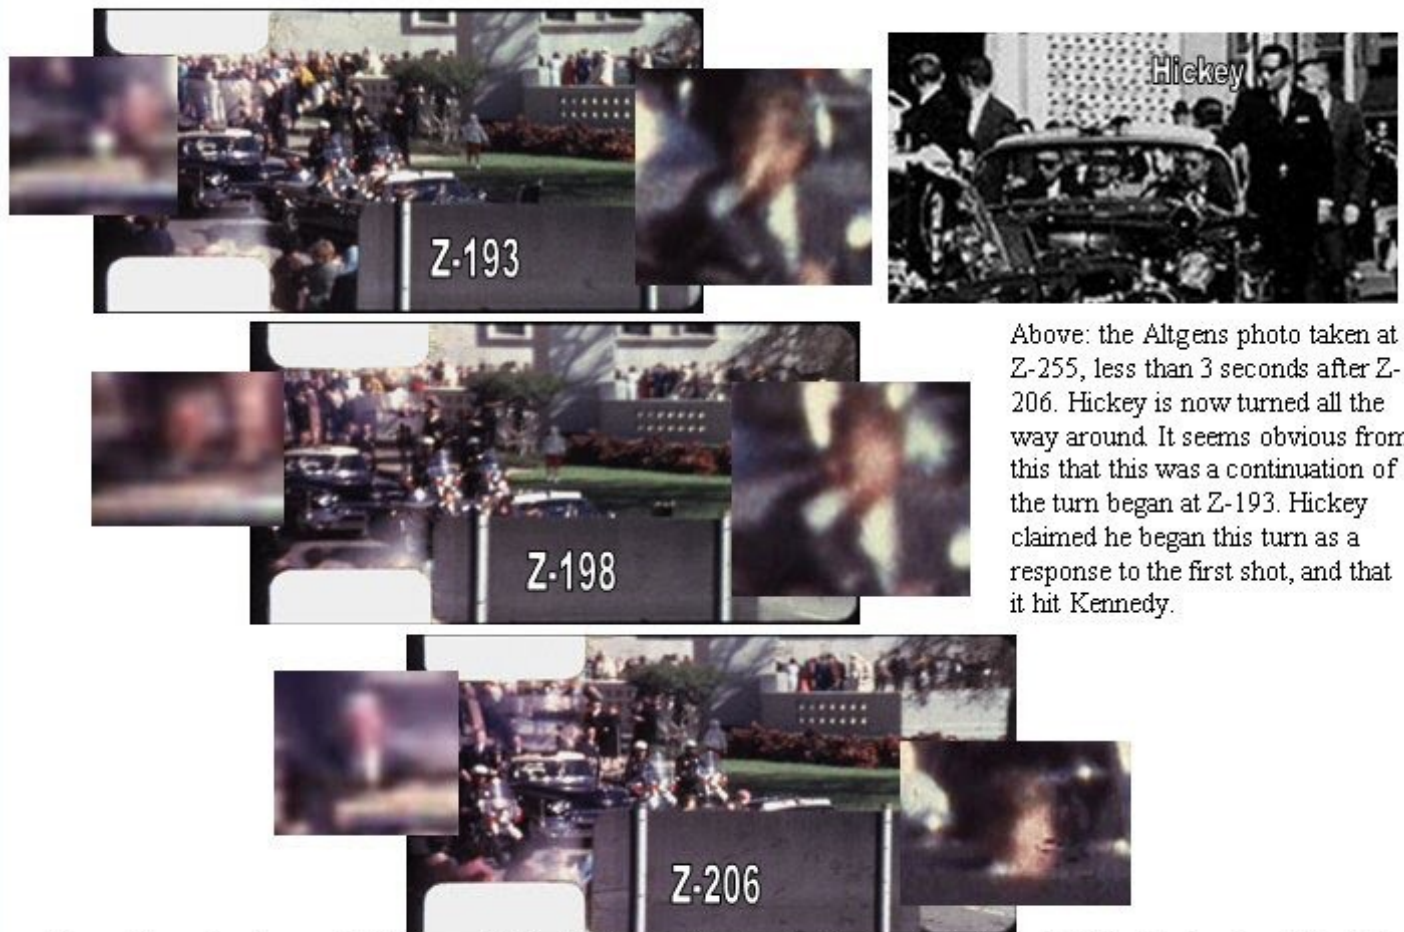

The acknowledgment by the panel that Connally showed no reaction to a bullet purportedly striking himself and Kennedy until at least a second after Kennedy was, of course, a problem. The reaction of many single-assassin theorists, raised on the belief that Kennedy was hit while behind the sign in the Zapruder film, was to dismiss this new and improved time for their beloved theory out of hand.

When one looks at the Zapruder film in slow-motion, however, one can see the photographic panel was almost certainly right. Kennedy DOES appear to be hit before he heads behind the sign. In a paper delivered to the American Academy of Forensic Sciences in February 1971, and published in the Journal of Forensic Sciences in October 1971, Physicist Don Olson and Criminalist Ralph Turner pre-cursed the HSCA photography panel and observed that "Beginning as early as frame 194, the President's body seems to undergo a motion forward and to the left. This motion, which can be visually approximated to be on the order of six or seven inches, seems to begin in frame 194 and continues through about frame 200. The President seems to move away from the seat back and tilt to to the left, away from the window ledge...On the interval 194-200 the President's body is seen to narrow somewhat to the view, indicating that he not only leans to the left front, but also is rotated to the left. The rotation of the shoulders begins as early as frame 195. His head comes around at 200-202. By frame 204 the President is facing almost directly forward."

During this visible jerk by Kennedy to his left, his wife turns to look in his direction (as depicted in frame 206 on the slide up above). They then go behind the sign. When he emerges he has clearly been hit. When one reads the testimony of Abraham Zapruder and the statements of his secretary Marilyn Sitzman, who stood beside him, one finds, moreover, that both of them believed they saw him hit. Neither of them mentioned his appearing to be hit as he came out from behind the sign. When one recalls that Hugh Betzner stated he heard the first shot just after he took a photograph (shown to be taken at 186), and that Phil Willis said he heard the shot and it startled him into taking a photograph (shown to be taken at 202) and that the Willis photo shows Kennedy already starting to lean over, furthermore, it seems clear Kennedy was first hit in the back around frame 190, before he went behind the sign.

Yes, I agree with the HSCA that Kennedy was hit by a shot at frame 190.

The Simultaneous Head-Snaps

Above: the Altgens photo taken at Z-255, less than 3 seconds after Z-206. Hickey is now turned all the way around. It seems obvious from this that this was a continuation of the turn began at Z-193. Hickey claimed he began this turn as a response to the first shot, and that it hit Kennedy.

Above: Zapruder frames 193, 198, and 206, with George Hickey isolated on the left, and JFK isolated on the right. Note that Hickey turns his head to his right at the same time that JFK jerks his head to his left.

The Simultaneous Head-Snaps

Yet another argument supporting that Kennedy was first hit around frame 190 of the Zapruder film comes from reading the Secret Service reports of George Hickey, one of the President's body-guards, who was riding in the back seat of the car behind the President on 11-22-63.

In his 11-22-63 report (18H765) Hickey states "As 100-X made the turn and proceeded a short distance, I heard what seemed to me that a firecracker exploded to the right and rear. I stood partially up and turned to the rear to see if I could observe anything. Nothing was observed and I turned around and looked at the President's car." His 11-30-63 report (18H761-764) clarifies a few things: "After a very short distance I heard a loud report which sounded like a firecracker...I stood up and looked to my right and rear in an attempt to identify it. Nothing caught my attention except people shouting and cheering. A disturbance in 679X caused me to look forward to the President's car."

Hickey's statements are most informative regarding the timing of the first shot. While he is looking to his left at frame 193 of the film, he turns his head rapidly to his right just afterward. His rapid turn to the right, in fact, almost mirrors Kennedy's head jerk to the left, as an apparent response to this first shot. While Hickey disappears from the Zapruder film shortly thereafter, one can't reasonably argue that he stopped his turn partway and then began another turn or that he turned to his right in response to

something other than the first shot. The Altgens photo, after all, shows him turned all the way around to his right less than 3 seconds later.

So why do so many latch onto Governor Connally's statements about turning to his right after the first shot, and use that to conjure up a first shot-miss around frame 160 not described in the statements of any of the witnesses, when there are witnesses like Hickey whose statements, when taken in conjunction with the Zapruder film, confirm the statements and testimony of the vast majority of the witnesses--that the first shot hit? Hickey certainly never said anything to contradict himself. Not true for the Governor. Heck, even single-assassin theorist Godfather Vincent Bugliosi has problems accepting Connally's statements. On page 381 of *Reclaiming History*, he writes: *"The only thing that rings true to me about the governor's reflections on what was happening around the time he was hit is not when he tries to be precise, but when he said things like this in his 1978 testimony before the HSCA: 'When I was hit, or shortly before I was hit--no, I guess it was after I was hit...' All of his hesitation and confusion is more in keeping with what I would expect from a witness who had sustained the kind of injuries Connally did."*

I think we all know the answer. People reject Hickey's statements but swear by Connally's because Connally's statements fit in with what they want to believe. The HSCA believed a first shot missed around frame 160 because it matched the timing of the sounds on the dicta-belt. Single-bullet theory devotees believe a first shot missed around frame 160 because it gives Oswald more time to fire his weapon, and makes his purported feat more palatable. (The thought occurs that "feat" and "palatable" should not be used in the same sentence, lest one confuse others into thinking one's put one's foot in one's mouth.)

The acceptance of Hickey's statements, furthermore, would bring grave doubt to the single-assassin conclusion. Here's the next few lines of his 11-30-63 report (18H761-764): "Perhaps 2 or 3 seconds elapsed from the time I looked to the rear and then looked at the President. He was slumped forward and to his left, and was straightening up to an almost erect sitting position as I turned and looked. At the moment he was almost sitting erect I heard two reports which I thought were shots and that appeared to me completely different in sound from the first report and were in such rapid succession that there seemed to be practically no time element between them." By his having heard only one shot before he turned back around to look at the President--which would have to be after frame 255, as the Altgens photo taken at that time showed him to be looking straight back behind him--and by his having heard two shots in rapid succession after he turned back around, Hickey not only supported the HSCA's conclusion that, if there was a shot striking Kennedy and Connally that was heard by anyone, it would be the shot fired around frame 190, but that the last two shots were fired too close together to have been fired by Oswald alone. This makes his statements as good as poison to those certain in their beliefs that Oswald was the sole assassin. Bugliosi, despite his doubts about Connally, never once discusses Hickey's statements in regards to the timing of the shots in his over-2500 page monster of a book, *Reclaiming History*.

But there's no honest reason to reject Hickey's statements.

Zapruder Frames 223-226

Subsequent to the HSCA, better versions of the Zapruder film became available to the public. This led to the wholesale rejection of the HSCA's single-bullet theory.

Few ever subscribed to their version of the theory anyhow. Single-assassin theorists, not quite comfortable with the HSCA's proposition that Connally showed no reaction until almost two seconds after Kennedy had been hit, began working backwards, looking for the precise moment that Connally was hit, so they could see if it looked like Kennedy was also hit at this time. Now, they could have cited a 1976 study of the film conducted for CBS News by the Itek Corporation; this study had come to the conclusion that Connally had been hit by frame 224. And they could also have consulted the 1979 report of the HSCA Photographic Panel, which had also held that Connally was hit by frame 224. And they could also have consulted with Dr. Cyril Wecht, who, in opposition to the many conspiracy theorists claiming that Connally was not hit until frame 234 or afterward, had been claiming since at least 1975 that Connally first showed a reaction to being hit between frames 223 and 224.

But acknowledging any of these studies would have meant acknowledging that men such as Wecht could be right sometimes, and capable of noticing things overlooked by the Warren Commission. So, the single-assassin theorist community and mainstream media withheld its judgment on the precise time Connally was wounded until 1993, when *Case Closed*, a book largely devoted to tearing down

conspiracy theorists and supporting the Warren Commission, warmly embraced a study of the Zapruder film performed by a legal services company, Failure Analysis. This study, prepared for a mock trial of Oswald in 1992, had concluded that Connally first showed signs of being hit at...frame 224.

Be prepared for a shock: I think they're right.

On the digitized version of the film, a reaction by Connally at frame 224 seems obvious...his hair lifts up, his shoulder turns rapidly to its right, his lapel is pulled forward... And Kennedy's behavior confirms that he, too, has suffered an injury.

Of course, as we've seen, there's reason to believe Kennedy was hit before this frame as well.

When one looks closely at Zapruder frames 223-226, one can see that Kennedy's hands were coming down in 224 and 225, and only started heading towards his throat in 226. This further supports the possibility he was hit before 224 and was beginning to respond only to suffer a second wound to his throat at the same time Connally was hit.

Since this second shot came less than 2 seconds after the shot striking Kennedy around Z-190, moreover, and since FBI's tests showed it would take a minimum of 2.8 seconds for someone using Oswald's bolt-action rifle to eject a spent shell and re-aim. my acceptance that Connally is hit at frame 224 forces me to conclude that one of these shots was fired by someone other than Oswald.. While the HSCA, relying upon the controversial analysis of a police dictabelt, concluded that Oswald had fired his rifle at both 160 and 190, their own ballistics tests indicated he could only have done this by point-shooting, that is, just aiming the rifle in a general direction without using the sight. (One might presume they believed that Oswald felt there just wasn't enough time to actually aim.) That the HSCA held nonetheless that Oswald not only attempted his second shot without aiming, but hit Kennedy and Connally with the so-called "magic" bullet on this shot, is indicative that perhaps the HSCA was jealous of the Warren Commission's Single-Bullet Theory and was trying to one-up them by designing a bullet that was even more magical.

But that's just silly.

Not Waving, Being Shot

When one studies the frames of the Zapruder film, it becomes clear that something happens to Kennedy just before he disappears behind the Stemmons Freeway sign. Note the rapid turn of his head from right to left between frames 193-198 (less than 1/3 of a second). Note that the palm of his right hand, which he's been waving to the crowd, rotates clockwise in this same brief period, pausing briefly in front of his face. Note also that this hand drops sharply in the second between frames 206 and 224.

Not Waving, Being Shot

Equally silly is that Dr. Lattimer and his devotees, in an attempt to preserve the single-bullet theory, have tried to pretend that the HSCA Photographic Panel was full of beans and that there are no signs of Kennedy's being hit before frame 224 of the Zapruder film. While looking to Connally's movements to tell them the moment of a first shot miss circa frame 160, they willfully ignore Kennedy's far more significant movements between frames 190 and 210. Somehow they perceive the frantic movements apparent as he heads behind the sign as his calmly waving to the crowd. Heck, even the Warren Commission knew this wasn't true.

To refresh, a 4-22-64 memo written by Warren Commission counsel Melvin Eisenberg revealed:

- *A screening was held of the Zapruder film and of slides prepared by LIFE from the film. Each slide corresponded with a separate frame of film, beginning with frame 171. The consensus of the meeting was as follows:*
- *(a) The President had been definitely hit by frames 224-225, when he emerges from behind a sign with his hands clutching his throat.*
- *(b) The reaction shown in frames 224-225 may have started at an earlier point - possibly as early as frame 199 (when there appears to be some jerkiness in his movement) or, with a higher degree of possibility, at frames 204-206 (where his right elbow appears to be raised to an*

artificially high position).

So, how do Lattimer and his #1 devotee, Gerald Posner, the author of *Case Closed*, deal with this memo? They are, after all, defenders of the Warren Commission. They can't just ignore that the commission lawyers charged with studying the Zapruder film saw evidence suggesting that Kennedy was hit before the frame number eventually chosen as the moment of the first shot's impact.

Wanna bet? In *Case Closed*, Posner presents *"The latest enhancements show that before the President disappeared behind the sign at frame 200, he was waving to the crowd with his right hand. Even when the car and his body are obscured by the road sign, the top of his right hand can be seen waving."*

The "jerkiness" and "artificially high position" of Kennedy's right elbow had thereby been flushed down the memory hole.

Now, to be fair, Lattimer and Posner weren't the first to fail to notice these things. *Life Magazine*, in the 11-25-66 issue in which they called for a new investigation, nevertheless claimed that the Zapruder film *"shows the President still waving cheerfully as late as frame 206."*

But Lattimer and Posner compounded *Life's* silliness by desperately trying to explain away what would have to be seen as an incredibly rapid reaction by Kennedy to the bullet striking him at frame 224. Yep, in a moment of profound weakness, they offered up that the bullet nicked Kennedy's spine, and caused him to assume the "Thorburn's Position," an immediate locking of the arms.

The reasons for this silliness were clearly demonstrated in the 1992 mock trial of Oswald put on by the American Bar Association, and televised by Court TV. During this trial, prosecution witness Dr. Robert Piziali, after studying President Kennedy's movements in the Zapruder film after frame 224, asserted that the same bullet struck Kennedy and Connally at frame 224, and that a "reflexive reaction" to this impact would take "approximately 200 ms, which is exactly the time from when the bullet passes through Governor Connally's lapel and we see the first motion of the President's elbow." Ouch. This was painfully incorrect. It was so incorrect that even the most ardent single-assassin theorists could see that it was incorrect. Beyond that the bullet did not pass through Connally's lapel, but at a lower point on his jacket, 200 ms is more than three-and-a-half frames of the Zapruder film. No one outside Dr. Piziali, of whom I am aware, has ever, after studying the Zapruder film, asserted that Kennedy's "reflexive reaction" doesn't start till frame 227 of the film. Equally suspicious, upon cross-examination, Dr. Piziali confirmed that yes, it was his expert opinion that Kennedy was bringing his hand down after a wave in frame 225. This ignored that Kennedy's hands began rising back up in frame 226, not 227, and that frame 226 was not three and a half frames after the impact on Connally first apparent at frame 224.

Afterward, defense witness Dr. Roger McCarthy confirmed that a reflexive reaction on Kennedy's part would take about 200 ms, but disagreed with Piziali's conclusions. He asserted that Kennedy's hand movements in frames 225 and 226 were much too rapid to be reflective of his bringing his hand down after a wave, and that Kennedy was therefore most likely reacting to a shot at this time. He testified that, accordingly, Kennedy was most likely hit no later than frame 221, by a different bullet than the one hitting Connally at frame 224.

This didn't jive with the single-assassin theory, of course, and had to be rejected. Thus, in 1993, the next year, writer Gerald Posner offered the single-assassin faithful the hope they'd been looking for, telling them on page 328 that a spinal injury to Kennedy's sixth cervical vertebra, as purported by Lattimer, would cause an "instantaneous reaction." On the next page he spelled out just how "instantaneous." He wrote: "Kennedy's Thorburn response, from spinal damage, at frames 226-227, came between one tenth to two tenths of a second after the bullet hit him, which translates to 1.8 to 3.66 Zapruder frames." By pretending that Kennedy's reaction could have started as late as frame 227,

and that it could have taken as little as one-tenth of a second, Posner was, not surprisingly, covering his pet assassination theory. If people said Kennedy was hit by 227, he could say the reaction took two-tenths of a second. If they said he was hit by 226 he could say it took one tenth of a second. Posner failed to tell his readers that both the Warren Commission and HSCA concluded that Kennedy was clearly reacting to something before frame 226, and that both sides of the 1992 mock trial he cited throughout his book agreed that the reaction time would be at least two tenths of a second, and that the one tenth of a second reaction time he presented for his readers' consideration was something he just made up.

The irony here is that I don't entirely disagree with Posner about the one-tenth of a second reaction time. It seems quite possible that Kennedy, at frame 226, is reacting to the same burst of gunfire hitting Connally at frame 224. You see, the flipping of Connally's lapel was most probably not caused by the bullet itself, but by the explosion of blood and rib from Connally's chest after the bullet made its exit. The bullet causing this reaction would most probably have hit Connally just after frame 223. Kennedy's hands lift in frame 226, which means they had reversed course either between frames 224 and 225 or 225 and 226, most logically the latter. This would indicate a reaction time of around 2 frames or just over the one-tenth second reaction time offered by Posner, provided both men were hit by the same bullet. If Kennedy and Connally were hit by separate shots fired from an automatic weapon, of course, the overly-rapid reaction by Kennedy in comparison to the impact on Connally is more readily explained.

But that's a separate issue. It's important we note here that Lattimer and his devotee Posner, by pushing the "Thorburn theory," were simultaneously rejecting the conclusions of both the Warren Commission and HSCA that Kennedy was hit when he came out from behind the sign, and were instead pushing that Kennedy was not responding to a shot, but only waving, in frames 224 and 225 of the Zapruder film. And that's just plain silly.

Actually, Posner and the single-assassin community's propping up of Lattimer and his "Thorburn theory" to help sell the single-bullet theory is worse than their simply being silly. Lattimer's "Thorburn theory," holding that Kennedy's arms immediately locked into place after being hit, was, and is, a hoax. A careful viewing of the Zapruder film shows that although Kennedy's elbows remain slightly bent after frame 224 for the phenomenal length of five seconds, his arms themselves are far from locked and drop almost immediately. Even more damaging, as discovered by Millicent Cranor and reported by Wallace Milam, the position described by Thorburn in the 1800's was not an immediate locking of the arms, but a position assumed over a couple of days as the afflicted patient sunk into paralysis and death.

And, should one think that--no matter what he called it--Lattimer was onto something when he pushed that the passage of the bullet by the nerves in Kennedy's neck caused his arms to fly up as a reflex, one should consider that this has been disputed as well. And not by a conspiracy theorist such as myself, but by a recognized expert on such things... Yes, an article by Julie Dunn on the website of Kenneth Rahn reports that on December 13, 1994 she contacted famed neuropathologist Dr. Jan Leestma and asked him about Lattimer's "Thorburn" theory. Leestma reportedly said *"it seems to me a reaction as such would just never occur. I don't care if the sixth cervical segment was severed or just touched, the nerves in that area would not go into an immediate neurological reaction with arms flying up, they would fall limp."* He even explained *"when you physically shock any nerve, the last thing it does is fire. It classically becomes electrically silent. Whether the spinal cord is directly hit or grazed, the nerve cords extending beyond the actual spine would be affected and fall silent."*

Still another argument against Lattimer's "Thorburn theory", and one all my own, comes from the presumption that the immediate paralysis described by Lattimer would also cause Kennedy to lose control of his bodily functions. If this is so, then it would seem significant that Kennedy's x-rays, as

interpreted by all three x-ray professionals present at his autopsy, Dr. John Ebersole, Jerrol Custer, and Edward Reed, revealed a significant amount of fecal matter in his colon. That's right; I'm using fecal matter to combat fecal matter.

And I'm not afraid to sling it... Is it just a coincidence that Gerald Posner, the primary spreader of Lattimer's manure, was in 2010 exposed as one, let's say, lacking in ethics, after it became clear he'd been routinely plagiarizing the works of others in his columns for the Daily Beast? I suspect not.

I also suspect he wasn't the only prosecutor-turned-writer to try and "lawyer" his readers into believing something he knows is most unclear. In the first section of Vincent Bugliosi's 2007 single-assassin theorist manifesto, *Reclaiming History*, he describes a first shot miss, and then a second shot 4.9 seconds before the head shot, at roughly frame 224 of the Zapruder film. He claims this second shot is the one that hit Kennedy and Connally. Later, while discussing in the photo section the position of the limo at the time of this second shot he claims, first, that it was "somewhere around frame 210" and then, on the next page, that it was "within a split second of frame 210." Nowhere in the book is it acknowledged that one of the expert witnesses used by Bugliosi in his prosecution of Oswald in a 1986 mock trial was Cecil Kirk, from the HSCA Photographic Panel, and that Bugliosi had Kirk testify that a comparison of frames 195 and 199 of the Zapruder film indicated that Kennedy was shot at this time. (When looking at the second frame, Kirk testified *"Now you see that the President's arm is super-extended. We interpreted this to be a stimulus."* When asked by Bugliosi if this was a response to his being hit the first time, Kirk testified *"That's correct."*) No, instead of acknowledging that he had previously introduced evidence into a court of law that Kennedy was reacting to a shot before frame 199 of the Zapruder film, Bugliosi, in *Reclaiming History*, presents frame 204 of the film with the misleading caption *"Kennedy, now past most of the spectators on his right, begins to lower his right arm."*

What had been a reaction to a stimulus was now just a relaxing of the arm. Evidently, Mr. Kirk and his testimony had fallen down Bugliosi's memory hole.

theory at Z-223. The blue arrows represent trajectories.

Where's Nellie?

When one looks at Warren Commission Exhibit 895, a photograph purporting to represent the trajectory from the sniper's nest at frame 225, roughly $1/10^{\text{th}}$ of a second after the point single-assassin theorists now claim Kennedy was hit, one can find yet another reason to doubt the new and "improved" version of the single-bullet theory. Since the bullet found on the stretcher in Parkland Hospital, the "magic" bullet, was largely undamaged, the theory is dependent on the presumption that the bullet struck no bones on its way through Kennedy. Since the bullets used in Oswald's rifle, per the testimony of the Warren Commission's and HSCA's own ballistics experts, were among the most stable ever tested, it follows that there should have been little deviation from its path while going through the President. And yet the target on Kennedy's neck in the Warren Commission's own re-enactment aligns not with Connally's right armpit, where he was struck, but the middle of his back! While one might muse that the bullet was deflected slightly by the knot in Kennedy's tie towards Connally's armpit, this would then necessitate its being deflected both to the left and downwards once again when it struck Connally's rib. Perhaps this problem in alignment is why the FBI, under the direction of the Warren Commission's Arlen Specter, failed to measure the right/left angle from the sniper's nest into the limousine. They measured the angle of descent from the sniper's nest into the limousine to the minute, but made no measurements whatsoever of the cross-angle.

Since this exhibit, much as the HSCA exhibit showing the trajectory of a single-bullet shot at frame 190, conclusively demonstrates that Connally would have to have been sprawled across his seat for his wounds to align with Kennedy's, we are forced to look at the Zapruder film once again, and see if we can conclusively determine Connally's position at frame 224.

It occurred to me that one could do this by establishing the relative positions of the limousine's occupants, and projecting them onto the scale drawing of the limousine provided by the Warren Commission and HSCA, and see what made sense. Since the limousine was moving roughly a foot per frame and since the Connallys were sitting roughly two feet in front of the Kennedys, the Connallys in frames 223 and 224 occupied the same relative space as the Kennedys in frames 225 and 226. As demonstrated on the Z-223-226 slide, when one compares these frames, it becomes readily apparent that John and Nellie Connally were roughly 90% as far apart as John and Jackie Kennedy.

From this we can establish Connally's actual position. If one places Connally far enough over in his seat to receive a wound in his right armpit from a bullet exiting Kennedy's neck in a straight line from the sniper's nest at 224, and places Jackie Kennedy far enough over so that she's in line with Connally a la the Zapruder film, a placement of Nellie Connally 90% as far from her husband as Jackie Kennedy was from the President pushes Nellie off her seat and up against the side of the car. I refuse to believe the first lady of Texas was draping her face over the side of the limousine and lapping up wind like a dog. That she seems far too close to her door is an indication, clearly, that everyone, save the President, should be shifted back to their right. If one shifts Connally just a few inches to his right, however, the single-bullet theory trajectory, via rear-projection from Connally's wounds, pivots onto the roof of the Dal-Tex Building. If one simply shifts Kennedy all the way to his right, so that he is draped across the side of the car, as has been done in most current re-enactments and simulations, on the other hand, it takes care of Nellie and places her more towards the center of her seat, but opens up a whole series of other problems.

For when one looks closely at the Zapruder sequence from 223-226 one can see that Kennedy's right arm was inside the car and did not even leave a shadow along the side of the car. This would appear to place him several inches inwards from the position used in a 1998 laser re-enactment. If one compares Kennedy's position in frame 225 against that of Secret Service Agent Roy Kellerman, the passenger in the front seat, moreover, it seems clear that both men are roughly the same distance from the side of the car. And yet, in order for Kellerman to be in line with Nellie's position in the Zapruder film (and have her be 90% as far from her husband as Mrs. Kennedy was from her husband) Kellerman would have to have been twice as far away from the side of the limousine as Kennedy.

Once again, the proper positioning of the passengers in the limousine and Kennedy and Connally in particular pivots a backwards trajectory through Connally and Kennedy's wounds from the Texas School Book Depository across the street to the Dal-Tex. I've said it before and I'll say it again. Kennedy and Connally's wounds only align if the shot originated from the Dal-Tex Building.

mid-line of the throat, as per the HSCA, would barely miss
the spinal column, and would crash through its transverse process.

The Single Bullet Theory Redux

The single-bullet theory, with its new and "improved" impact frame of Z-224, was first revived in the eyes of the public by Gerald Posner in his 1993 book *Case Closed*, a response to Oliver Stone's *JFK*. In his defense of the single bullet theory, however, Posner was grossly deceptive. He repeatedly cited Dr. Lattimer as an expert on the single-bullet theory without mentioning that Dr. Lattimer believed the bullet entered Kennedy's neck at a point inches higher than even the Warren Commission. He also published an exhibit demonstrating the single-bullet theory prepared by a legal services team called Failure Analysis without mentioning that this exhibit was made for a mock trial in which Failure Analysis prepared exhibits for both sides, including exhibits indicating the single-bullet theory did not work.

A simulation, performed in Dealey Plaza on September 3, 1998 for a TV show called the Secret KGB JFK Assassination Files, was equally disingenuous. In this simulation, performed under the guidance of noted wound ballistics expert Vincent J M. DiMaio (not surprisingly, a close colleague of the Clark Panel's Dr. Fisher), the dummy's body needed to be bent forwards in order to get the laser beam connecting the locations of Kennedy's wounds to reach the sniper's nest. If one imagines this dummy sliding back a few inches to match Kennedy's position at Z-225, the first frame he can be seen after coming out from behind the sign, however, the backwards trajectory from Connally through Kennedy's neck once again pivots to Kennedy's left and once again ends up on the Dal-Tex Building. If one projects backwards at the 25 degree angle of the wounds reportedly from Kennedy's neck through Connally, moreover, this projection leads precisely to the roof of the Dal-Tex Building.

But a cursory knowledge of anatomy is all one really needs to doubt the single-bullet theory. As

discussed in The Smoking Spine section of the last chapter, if one looks at a cross-section of the level of the bullet's purported passage, the 7th cervical vertebrae and the 1st thoracic vertebrae, and projects an 18 degree right-to-left trajectory through the body, ala the HSCA's trajectory analysis, one can see that a bullet entering at the location apparent on HSCA exhibit F-58 would nick a man's spinal column. Even worse, a bullet entering 2/3 of an inch closer to the mid-line, as apparent on the autopsy photo, would plow right through the spine and exit from the left side of the neck. Should one allow that Kennedy was scrawnier than the man used for the medical slides, and compress the cross-section so that an 18 degree bullet can connect Kennedy's back wound with the exit in his throat, one still finds that the bullet would smash right through his right transverse process, the small bones that stick out to the left and right of the column. This problem with the spine was discussed by Dr. John Nichols in the 1970's. More recently, Dr. David Mantik has plotted out this trajectory on CAT scans of men with Kennedy's precise proportions and has confirmed that a trajectory connecting the back wound with the purported location of the throat wound would have to pass through bone. According to Drs Pryor and Cotton in 2005's Ballistic Trauma: A Practical Guide, the use of entrance and exit locations on CAT scans to accurately plot the internal trajectory of bullets traveling through the neck has been tested with positive results. Since the so-called magic bullet found on a stretcher in Parkland hospital shows no sign of crashing through bone this casts a great shadow over the single-bullet theory. (While the HSCA acknowledged that the right transverse process of Kennedy's first thoracic vertebrae was damaged, single-assassin theorists almost unilaterally maintain that a temporary cavity caused by the bullet's rapid passage struck this process, and not the bullet itself. This explanation is of course necessitated by the undamaged condition of the bullet's nose.)

While a bullet fired from the sniper's nest and striking Kennedy at frame 224 of the Zapruder film, the single bullet scenario currently in vogue, would be coming in at less of an angle than the 18 degrees described by the HSCA's trajectory analysis (which was built around a shot at frame 190), it would still exit the left side of Kennedy's throat. Should one decide Kennedy straightened out between Z-190 and Z-224, so that he was no longer turned 5 degrees to his right, as proposed by the HSCA, it would restrict the damage to Kennedy's trachea to his right side, and be more in line with the recollections of his doctors. Unfortunately, for single-bullet theorists, this trajectory still plunges through the spine.

This comparison between the HSCA's single-bullet theory and the "single-bullet theory redux" raises an interesting point. Few single-bullet theorists acknowledge that with the recent change in frame number they've re-interpreted the position of the President from the HSCA's trajectory analysis. Many in fact claim to accept both the wound locations of the HSCA forensic pathology panel and its trajectory analysis, even though (as we have seen) they are in opposition and designed around a shot at frame 190, when the President was about 30 feet closer to the gun than at frame 224.

It's like saying that GM builds the best trucks, and then citing a report saying that Ford builds the best trucks as support for your statement. You can't have it both ways. You're either in agreement with the HSCA's trajectory analyst or you're not. You're either supported by the "experts" or you're not.

And should one think I'm nit-picking on this issue, one should be informed that animator Dale Myers, perhaps the most respected of the current batch of single-bullet theorists, agrees, and has concluded that the wounds in Connally and Kennedy project back to the sniper's nest but for the split second between frames 217 and 224 of the Zapruder film, and that the HSCA's trajectory analysis was fatally flawed in both its interpretation of the single-bullet trajectories, and head wound trajectories.

So single-bullet theorists can't have it both ways, try as they might. As a result, many of them have stopped citing the HSCA's "rocket scientist," Thomas Canning, as the definitive expert on the trajectories, and instead cite Dale Myers, a mere animator, as the definitive expert. This is indeed hypocritical. If Canning--the supposed expert--was wrong, as they now claim, and Myers, an amateur,

was right, on what grounds can they pretend that the findings of an amateur such as myself should automatically be rejected in favor of the "experts" to whom they normally defer. They can't. Not if they give a damn about intellectual consistency.

Still, many single-assassin theorists evade this trap by telling themselves an animator such as Myers possesses unique skills, and is every bit the expert in his own way as NASA trajectory expert Thomas Canning was in his. There's at least one point on which single-bullet theory revisionists are most definitely NOT supported by any of the top "experts" they so love to cite, however: the location of the back wound.

Dr. Lattimer and the Big Lie

Although one might think Dr. Lattimer, a urologist, after having his interpretation of Kennedy's back wound location so thoroughly rejected by the nine forensic pathologists on the HSCA pathology panel, would simply revise his interpretation, but continue to push that the single-bullet theory was correct, one would be wrong.

Apparently, there was too much at stake. Not only had Lattimer staked his reputation on the thoroughly repudiated proposition that the back wound was well above the throat wound, the reputation of the Warren Commission, and, by extension, the Executive Branch of the Government, also hung in the balance. In 1967, and then again in 1968, the Justice Department had convened panels of doctors to interpret the photos. Both panels had asserted that the autopsy photos demonstrated that the back

wound was well above the throat wound. In 1972, after becoming the first "independent" researcher allowed to inspect these photographs, Lattimer, amazingly, went even further, and emerged from the archives with the proposition that the back wound was even higher on the back than depicted in the drawings created for the Warren Commission. In 1975, Warren Commission lawyers W. David Slawson and Richard M. Mosk wrote an article for the L.A. Times arguing against a re-investigation of the medical evidence; in this article, they asserted "The evidence concerning the wounds conclusively dispels the idea of shots from the front...The wounds both slanted downward from Kennedy's back. This is clear beyond doubt from the autopsy and from the photographs and X rays of the body...to doubt the evidence of the wounds is to label as liars the doctors who examined the body, the pictures and the X rays for the commission." Well, here, in 1978, were nine top pathologists, working for the House of Representatives, not only doubting the evidence of the wounds, but asserting it had been incorrect. They were, in the eyes of Warren Commission supporters like Slawson and Mosk, admitting that the autopsy doctors--the men upon whose integrity the entire single-bullet theory had been built--were liars, and that, by extension, Dr. Lattimer, who'd asserted that the biggest lie pushed by the autopsy doctors--that the back wound was well above the throat wound--was an understatement--was an even bigger liar.

So what was he to do? He could admit he was mistaken, and take a body blow to his credibility, or he could double down, and insist that he, a urologist, was the sole doctor to inspect Kennedy's autopsy photos and x-rays in the decade to properly interpret the vertical relationship between Kennedy's back wound and throat wound.

As Dr. Lattimer was an avid collector of Nazi paraphernalia, he was almost certainly familiar with the following passage from Hitler's manifesto, *Mein Kampf*:

"in the big lie there is always a certain force of credibility; because the broad masses of a nation are always more easily corrupted in the deeper strata of their emotional nature than consciously or voluntarily; and thus in the primitive simplicity of their minds they more readily fall victims to the big lie than the small lie, since they themselves often tell small lies in little matters but would be ashamed to resort to large-scale falsehoods. It would never come into their heads to fabricate colossal untruths, and they would not believe that others could have the impudence to distort the truth so infamously. Even though the facts which prove this to be so may be brought clearly to their minds, they will still doubt and waver and will continue to think that there may be some other explanation. For the grossly impudent lie always leaves traces behind it, even after it has been nailed down, a fact which is known to all expert liars in this world and to all who conspire together in the art of lying."

In his 1980 book, *Kennedy and Lincoln*, Dr. Lattimer revealed that the repudiation of his findings by the HSCA pathology panel in 1978 had had no impact whatsoever on his unique interpretation of Kennedy's wounds. As a result, one is forced to wonder if his continuing to tout, in the absence of all evidence, and without any support among his fellow physicians, that the back wound was much higher on the body than the throat wound, is an example of a "big lie" in action...

Lattimer vs. Lattimer

1. When one compares Dr. John Lattimer's depiction of the single-bullet theory, above, with the photo of Kennedy he claims supports his theory, at right, it is clear something is wrong. The photo depicts Kennedy's right shoulder far above his chin, the level Lattimer claims for the back wound, but his left shoulder below his chin.

3. Other photos of a shirtless Kennedy, like the one at left, confirm that, when Kennedy was facing the camera, and not leaning forward, his mouth was well above his shoulders.

2. This demonstrates that Kennedy was leaning forward and to his left in the photo. When one matches this photo with the back wound photo (third from left across the top), moreover, other problems arise. While one can match the level of the shoulders, and have the back wound location match the level on Lattimer's depiction, one cannot do so without having the shoulders in the back wound photo align with a point on the back of Kennedy's head on Lattimer's drawing, at the level of Kennedy's mouth (as shown by the blue line above). This, of course, is ludicrous.

Lattimer vs. Lattimer

Yep, when it comes to bald-faced lying about the murder of a president, Lattimer pretty much set the standard with Kennedy and Lincoln. While discussing Kennedy's throat wound, for example, he asserted, *"any bullet that might have exited through this hole had had a definite downward course through Kennedy's neck, rather than the relatively horizontal course ...depicted in the official schematic diagram made by medical staff artist H.A. Rydberg."* Incredibly, even after the HSCA released a drawing of Kennedy taken from an autopsy photo showing his back wound to be, well, on his back, Lattimer chose to re-publish his 1972 drawing depicting the back wound to be at the level of Kennedy's chin, and the bullet to be descending on an even steeper trajectory through the President's neck than in the drawings created for the Warren Commission. This trajectory, if projected forward from the back wound in the autopsy photos, amazingly, would have passed right through the President's sternum, inches below the supposed exit on his throat.

In 1993, in an article published in the Journal of the American Medical Association, Lattimer tried to explain this last discrepancy. He asserted that a large fat pad on Kennedy's neck, aka the "hunch" or "hump," deflected the bullet downwards, and that Kennedy may have leaned forwards to talk to Connally just before he was shot at frame 224 of the Zapruder film. Astonishingly, Lattimer and the editors at JAMA had failed to realize that this proposed lean would lessen the degree of descent within

Kennedy's body, and make the 27 degree descent depicted in his drawing even more unlikely.

This was not all that surprising. By 1993, Lattimer had become something of a guru to his fellow single-assassin theorists, including JAMA's editor George Lundberg. As a consequence, in April 1993, he was invited to present his findings at an assassination conference in Chicago. Videotapes of this conference indicate that he was still 100% committed to his appallingly incorrect understanding of Kennedy's anatomy and wounds. As he showed the audience the Warren Commission's depiction of the single-bullet theory, CE 385, he explained: *"I knew President Kennedy and this was not President Kennedy. President Kennedy had a big hump on the back of his neck from all the steroids he was taking. And the point of entry, for example, of the bullet, isn't down there (pointing out the entrance on CE 385), it's way up here (pointing to the back of the neck) at the level of the base of his chin."* Later, when presenting his own drawing to the audience, he added: *"The hump on the back of his neck brought the point of impact of the bullet up to the level of his chin and the downward course of the bullet coming out low on his neck, where Dr. Perry did the tracheostomy."*

Well, this was just crazy talk. In Kennedy and Lincoln, Lattimer published a photograph of a shirtless Kennedy at Santa Monica Beach and claimed this photograph proved Kennedy's shoulders to be unusually high as a result of his Addison's disease. This was totally misleading. True, Kennedy's chin was below his right shoulder in the photo. But this was because he was leaning slightly forward, and to his left. His chin, tellingly, was not below his left shoulder. When one looks at other photos of a shirtless Kennedy taken after he'd contracted his disease, moreover, it becomes abundantly clear that his shoulders did not extend above his chin, and that his chin was at best at the level of the crease at the base of his neck. (The second shirtless photo of Kennedy on the slide above was taken in the mid-50's.)

I mean, just look at Lattimer's drawing, and compare it to the autopsy photo of the back wound... The autopsy photo proves the back wound to be inches below the point where Kennedy's shoulders connected to his neck. And yet, Lattimer's drawing presents this wound at the level of his chin. It follows then--yes, I know it's hard to believe that such a respected man could make such a crazy assertion--that Lattimer believed Kennedy's shoulders attached to his neck inches above his chin.

Don't believe me? Well, then consider that at the '93 Chicago conference, Lattimer showed the audience the JFK beach photo on the slide above, and pointed out the trajectory of the bullet through Kennedy's neck, beginning at the level of the light blue line on the slide above.

I mean, really, just who was Lattimer trying to fool?

Apparently, all of us...

Unfortunately, Lattimer's actions on behalf of his beloved single-assassin theory extended way beyond his creating a flawed drawing or two, and/or his inability to see its inaccuracies. He helped sell a whole generation of doctors and devotees that the single-bullet theory was viable and supported by meticulous research. Since his work on the head wounds was equally misleading, many in the conspiracy community assumed he was some sort of government plant. Upon his death in 2007, however, another possibility was revealed--that he was every bit as eccentric and wacky as the wackiest conspiracy theorist. You see, buried within his obituaries was an astonishing fact--that among Lattimer's many collectibles and prized possessions was an historically significant item he'd purchased some years before at auction, for a reported 3,000 dollars...Napoleon's shriveled penis!

Location, Location, Location

But enough about shriveled penises...

While single-assassin theorists are fond of repeating ad nauseum that conspiracy theorists can't accept the clear-cut truth that Oswald acted alone, and are in love with 'factoids' at odds with the evidence, the incredible hypocrisy of this overly influential "community" becomes apparent when one looks at their depictions of the single-bullet theory. In virtually all depictions, they take their lead from Lattimer and place the back wound above the throat wound at a point inches above the back wound location determined by the HSCA forensic pathology panel.

When asked if their doing so doesn't make them no better than the conspiracy theorists they denounce, and all too often despise, single-bullet theorist David Von Pein, who has littered the internet with literally thousands of posts and essays praising the single-bullet theory, gave what would have to be taken as an admirably honest response.

On December 24, 2011, on the alt.assassination.JFK newsgroup, he replied:

"You are exactly right, Pat. I plead guilty. And I'll admit that I am doing something that I often scold CTers for doing -- throwing out EXPERT testimony and clinging to my own personal beliefs. So, if you want to, you can shoot me down with Oswald's remaining unfired C2766 bullet. Yes, I'm asking for it, because I did something that I ridicule the conspiracy theorists for constantly doing. In this instance, I'm nothing but a hypocrite. However, I sincerely believe that the HSCA/FPP was wrong about the throat wound being higher than the back wound. And I think I've provided a very good reason for WHY I think they were wrong. Mainly-- this composite picture below, which plainly shows the throat wound to be LOWER than the bullet hole in JFK's upper back. And I don't see how anyone can argue with this plain-as-day observation. But, just in case you want to -- I'm ready to be strung up by the oak tree in front of the TSBD for my sin of disagreeing with the HSCA. I'm guilty. And I know it."

And this wasn't the first time he admitted his hypocrisy.

On February 14, 2008, in an online discussion of Vincent Bugliosi's book Reclaiming History, he wrote: *"In this particular narrow-based instance, I will readily admit that it (his re-interpreting the wound location) doesn't make me "any better than the looniest conspiracy theorist", due to the fact that I am doing what almost all conspiracy-happy people love to do with virtually ALL of the evidence in the case -- I'm completely ignoring the official conclusion of the HSCA's Forensic Panel in this particular "height of the wounds" regard...the HSCA's FPP was and is definitely DEAD WRONG when it comes to their conclusion that the back wound was anatomically lower than the throat wound. And even Dr. James J. Humes, JFK's leading autopsy doctor, has said so -- i.e., Humes himself said, in 1964 to the Warren Commission, that JFK's throat wound was "physically lower" than the wound located in Kennedy's upper back."* (Von Pein's citing Humes' Warren Commission testimony on this matter was of course pretty silly--seeing as he'd had been denied access to the autopsy photos before testifying. It becomes even more silly, moreover, when one considers that Humes' partner, Dr. Boswell, when confronted with the photos by the ARRB, and asked the magic question, approximated the back wound at the level of the second thoracic vertebra, well below the throat wound.)

Not surprisingly, Von Pein then went on to argue that his ignoring experts was somehow more "rational" than conspiracy theorists ignoring experts, and that, even if he disagreed with the HSCA panel about the wound location, he was correct in citing them as authoritative on the number of bullet wounds. He wrote *"I wouldn't compare the two things as being on equal levels. In one instance, the HSCA was attempting to determine how many bullet holes John Kennedy had in his body (and from what directions those shots were fired). But the other instance is quite different (and a bit more subjective in nature, given the fact they had no photo to work with that showed BOTH Kennedy's throat*

wound and his upper-back wound in the same photo for direct "relative height" comparison) -- i.e., the HSCA was trying to answer the "lower or higher?" question regarding those wounds by utilizing the autopsy photographs and the written record and the testimony of the autopsists (testimony taken 15 years after the assassination). And that's just exactly what other people have tried to do as well, using the very same pictures and documented testimony. And the HSCA, for some reason I'll never be able to fathom, came to the cockeyed determination that the two photos linked below (when viewed IN TANDEM and when using each of them to compare to the other) depict the upper-back wound (in the top photo) as being located anatomically LOWER than the wound in the front of JFK's neck, which is a wound that is fully visible in the bottom photo." (Von Pein's suggestion that comparing autopsy photos to determine the relative location of wounds on a patient's body is drastically more challenging to a medical professional well-acquainted with anatomy than determining the number and direction of bullets striking the body is of course without merit.)

He then, perhaps unwittingly, asserted that one's expertise is of but little importance when the evidence is so, well, gosh-darned evident. He declared: *"But as anyone with just one good eye can see (when comparing the individual wounds seen in each of the above photos), the bullet hole in JFK's upper back (which was determined by the HSCA to be the TOP SPOT [or "artifact"] in the top photo above) is not even close to being located anatomically LOWER on Kennedy's body when compared to the wound in the throat."* (While he is DEAD WRONG about this particular piece of evidence, I have to agree that one's relying on experts to interpret a photo can blind one to what's startlingly clear.)

Von Pein also discussed Vincent Bugliosi's approach to this matter: *"you can't really say that Vince and I think alike on this issue (at least when based on Pages 423 and 424 of VB's JFK book)....and that's because, based on the text found on those two pages, Vince says that he totally accepts the HSCA's findings as being true regarding the wound locations AND he also asserts that he does not accept the HSCA's conclusions (via his comments on page 424 at any rate)"*

Here, Von Pein was repeating information first discovered and exposed by myself on this webpage. He is correct to distance himself from Bugliosi on this issue, as Bugliosi's handling of this issue is mighty mighty strange. On page 423 of his book, Bugliosi writes *"The...bullet track, which is going downward through the president's body, is traveling upward anatomically."* But on the very next page, he enthuses *"Perhaps the clearest visual evidence of the fact that the entrance wound in the back was definitely above the exit wound in the throat appears in one of these photos taken of the left side of the president's head as he is lying on his back, his head on a metal headrest. Only the wound in the throat is visible, not the wound on the upper right back. However, it couldn't be clearer from this photo that the wound in the back was definitely above the exit wound in the throat."* These assertions are, of course, mutually exclusive. It seems that Bugliosi, like the dog in the Devo song "Freedom of Choice", had two bones, and failed to properly assess which one was best deserving of a lick.

So let's take a look at these photos and see what Von Pein and Bugliosi have been raving about.

Artwohl Analysis

Dr. Artwohl's spirited defense of the single-bullet theory

If Kennedy's ear was really 8 cm, then the man at far right was almost 8 feet tall.

Going, going, gone. As one takes other factors into account, Artwohl's 21 degree angle fades away.

Artwohl Analysis

The photos discussed by Von Pein and Bugliosi are the same ones discussed in the "Hunchback Analysis" slide of the last chapter. In the 1990's Dr. Robert Artwohl resurrected the incorrect assessment of these photos first pushed in the 1967 so-called "Military Review" and then later adopted by the Church Panel. Since that time, his comparison has been a mainstay on the much-visited JFK website of history professor John McAdams, confusing people by the thousands.

On the surface, his comparison almost makes sense. He uses the ruler in the back wound photo to measure the distance from Kennedy's neck line to his back wound and comes up with 5.6 cm. He then uses the length of Kennedy's ear in the lateral photo as a ruler, and plots out where this 5.6 cm down Kennedy's back would be on the lateral photo. This establishes his entrance. It's then just a simple matter of drawing a line between the back wound and the throat wound and measuring the angle. Not surprisingly, Artwohl came up with the exact angle the HSCA told us leads back to the sniper's nest.

He makes a number of mistakes. First of all, he uses 8 cm as the length of Kennedy's ear, which seems way too large. (Mine is only 6.8 cm and I have big ears.) Using a long distance photo of Kennedy for comparison I determined his ears were really more like 6.2 cm. (Should you doubt me, consider that, if this 8 cm measurement was real, Kennedy's throat wound was at a vertical level 2.5 inches below his Adam's Apple. Measure this on your own body and not along the throat itself--which runs at an angle--and see if this seems possible.) Second of all, even though the ruler in the back wound photo is clearly

pressed against Kennedy's back he measures this distance down Kennedy's back at the angle of his neck and not the angle of his back. When one makes these corrections, one finds that the angle from the back wound to the throat wound was really more like 14 degrees, the white trajectory in the slide up above.

But there are other factors as well. When one realizes that Kennedy's head in the back wound photo is turned slightly to his right, one should realize that this lowers his neck line by approximately one centimeter in comparison to the neck line in the lateral view. This means the 5.6 cm measurement leading to the back wound in the lateral photo should start a centimeter lower on Kennedy's neck. This drops the angle from the back wound to the throat wound down to 10 degrees, which is represented by the tan trajectory. Finally, one should take into account that Kennedy's body in the back wound photo appears to be laying on its left side with its right shoulder rolled forwards. According to my calculations (or, more precisely, my girlfriend's repeated measurements on my body), this would raise the back wound an inch or more in comparison to the throat wound, and drop the angle down to zero, as shown by the blue line.

But one need not rely on my words to see Artwohl is mistaken. Consider Artwohl's own. At the April '93 conference on the medical evidence in Chicago, Dr. Artwohl pointed out the "hump" on Kennedy's back where he claims the bullet entered, and said "The hump here really represents about the level of T-1." No, not really. I mean, he really said that. But that's not really what it represents.

And that's not the only time Artwohl has put his woeful grasp of anatomy on display. On the website of Professor John McAdams, in an attempt to demonstrate the failings of Dr. Cyril Wecht, he presents a few old online posts from Artwohl to Wecht, in which Artwohl unsuccessfully asks Wecht for clarification on a few key points. On one of these posts, dated 10-18-94, Artwohl writes that "the autopsy photographs clearly show that the bullet wound is 5.5 cm (about 2 inches) below the inferiornuchal crease (the lowest wrinkle in the back of JFK's neck). The inferior nuchal crease overlies the cervical spine at about the level of C4 or C5. Thus two inches below that would fall at the level at around the level of C7, or at the base of the neck." Artwohl is thereby claiming the back wound was around C7. Well, one look at the left lateral view of Kennedy with Artwohl's trajectory drawn in demonstrates beyond any argument that his proposed entrance location, which he says is at C7, is far closer to the "inferiornuchal crease" than it is to the level of the throat wound. This means that, in Artwohl's analysis, the throat wound was more than 2 vertical inches below the level of C7.

He's dead wrong. Kennedy's throat wound was indisputably near the level of C7/T-1. Two inches above this--where Artwohl places the back wound--would be around C5, not C7. Artwohl's analysis is nonsense.

Coat Check

Kennedy's left profile in 1960: image inverted.
Arrow reflects trajectory from sniper's nest at Z-224.

Artwohl trajectory superimposed onto
Kennedy's left profile autopsy photo

Tan Line = Artwohl entrance level

Blue Line = HSCA entrance level

Blue star reflects clothing entrance if
ear is 6.2 cm. Tan star reflects clothing
entrance if ear is 8 cm. a la Artwohl.

Coat Check

Should one still be confused by Dr. Artwohl's presentation, one should take a look at a comparison of the entrance locations in dispute with the undisputed entrance of the bullet on Kennedy's clothing, 5 3/8 inches below the top of his collar. Even if one uses Artwohl's 8 cm measurement of Kennedy's ear in one's analysis, it seems highly unlikely a bullet could enter so low on Kennedy's clothing yet as high on his back as Artwohl and Lattimer contend.

A look at this comparison, moreover, casts further doubt on the sincerity of the June, 1967 articles written by Sid Moody and Bernard Gavzer for the Associated Press, and published nationwide. In dismissing the Warren Commission's critic's claims that the jacket holes were too low to support the single-bullet theory, they claimed "Seeing the holes through the eyes of Lane, Epstein, and Weisberg, it might seem that the bullet which made them could not have hit the president in the base of the neck. But put a jacket and shirt on any grown man with reasonably well-developed shoulders, measure 5 3/8 inches below the top of the collar and a bit to the right of the seam, have him raise his right arm slightly (as the president's was) and mark the spot with a pencil point or chalk. Where does this touch the body? The base of the neck."

Oh really? The slight lift of Kennedy's right arm would lift the blue star in this comparison to the level of the tan line? I don't think so. Evidently, Moody and Gavzer weren't in the mind to double-check

their “facts” that day...

Coat Double Check

Above: a crop of the Croft photo in John Hunt's article The Case of the Bunched Jacket. Did the jacket really stick straight out?

Above: a crop of the color version of the Croft Photo, taken at Z-161. Or is the bunch really Kennedy's right shoulder seen at an angle?

Above: Z-161. The Zapruder film suggests Kennedy's right shoulder was indeed elevated at the moment in question.

At left: a photograph of Kennedy in the motorcade demonstrating that the bunched jacket peaked at Kennedy's right shoulder, and that the “bunching” did not extend up onto the back of his head. Is this just a coincidence?

Coat Double Check

But that doesn't mean we shouldn't double check our facts. The undisputed entrance on the clothing is also slightly lower than the back wound seen on the autopsy photos. This means that either there was some bunching of Kennedy's clothing on November 22, 1963, or that Kennedy's autopsy photos and the bullet holes visible on his clothing are in disagreement. If there was some bunching, of course, one should determine whether or not there was enough bunching to support the single bullet theory.

When one combs the internet for photos from the November 22, 1963 motorcade, one discovers that the jacket Kennedy was wearing in Dallas did undoubtedly “bunch” up whenever he lifted his arm. Virtually every photograph displays significant “bunching”. But was this bunching significant enough to support the single bullet theory? Could the bunching have lifted Kennedy's jacket high enough so that a bullet descending from 20 degrees or more above him could enter 5 3/8” below the top of his collar and still exit from his throat? Without deflection?

In researcher John Hunt's online article “The Case for a Bunched Jacket,” available on the website of John McAdams, he argues that the amount of bunching shown in the Croft photo is indeed significant

and suggests that the bullet entrance was high enough on Kennedy's body to support the single-bullet theory. I respectfully disagree. The straight line of "bunched jacket" sticking out at the back of Kennedy in Hunt's version of the Croft photo is in my considered opinion Kennedy's right shoulder pad seen at an angle. Clearly the line of the back seat in the photo runs parallel to a line connecting his left shoulder with the purported bunching of the jacket. While Hunt is quite correct in that there is bunching visible in most every photo of the motorcade, it would appear then that this bunching involved too little material to lift the clothing in line with the Warren Commission or Artwohl entrance, and nowhere near the amount of material needed to lift it in line with the Lattimer entrance.

Coat Check Mate

Above: the Artwohl trajectory featured on the website of John McAdams.

Above: HSCA Figure 1, Kennedy's jacket, sized to align the bullet hole with the Artwohl entrance if there was no "bunching."

Above: Fox autopsy photo (back wound lifted slightly by body position)

At right: HSCA Figure 1, sized to fit the body size of Kennedy in the Artwohl trajectory. There's far too much jacket between the level of the Artwohl entrance and the level of the bullet hole on the clothing. Just where did all this jacket go?

Coat Checkmate

That the holes on the clothing debunk the "Artwohl" entrance is perhaps more easily demonstrated by matching the size of Kennedy's head in the Artwohl trajectory to the size of his head in the back wound photo, and then matching the size of the back and neck in the back wound photo to an image of Kennedy's jacket. This suggests that the bullet entrance on Kennedy's jacket was far too low on his back to be aligned with a bullet entrance at the base of his neck. That is, UNLESS the jacket was significantly bunched up at the back of Kennedy's head, something totally unseen in the motorcade photos, and something proposed by no one.

Reality Check

The incredible silliness of the single-bullet theory as proposed by most theorists becomes clear when one looks at the single-bullet theory trajectories proposed by Dr. John Lattimer (left) and Dr. Robert Artwohl (middle) and compares them to photos of Kennedy's profile on 11-22-63 (right), with the level of the bullet hole entrance on the jacket noted (as done above with a red star). The collar to Kennedy's jacket was 1 ¼ inches wide. The bullet entered his jacket 4 1/8 inches below this point. As demonstrated above, even if Kennedy's collar had crept up an inch on the back of his neck by the time of the shooting, this would still leave over 3 inches of jacket material that somehow somehow had to get lifted above the bullet entrance in order for the bullet to have entered where Lattimer and Artwohl have proposed. This DID NOT happen. The single-bullet theory as proposed by Lattimer and Artwohl was a fairy tale.

Reality Check

Well, no one remotely reasonable. As if to advertise his lunacy, Dr. John Lattimer actually proposed Kennedy's jacket was bunched up at the back of his head, and that 5 3/8 inches of Kennedy's clothing (the measured distance to the bullet entrance on the clothing) had been lifted above the level of his chin! Complete nonsense. Utter hoo-ha.

And certifiably certifiable... Let's review. In the September 1973 Forensic Science Gazette Lattimer specified that *"the bullet holes in the clothing were about 13 or 14 centimeters below the upper edge of the collar, whereas the bullet hole in the back of the body, in this general location, was only about half this distance down from the expected location of the top of the collar."* He then related that *"The bullet hole in the President's upper back, near the base of his neck, was about two inches below the prominent crease across the base of the back of his neck."*

Now let's do the math. Two inches is basically 5 centimeters. Since the expected location of the collar was, according to Lattimer, as little as 6 1/2 cm above this location, it follows that the expected location of the top of the collar would be as little as 1 1/2 cm above the neck crease. So far, so good. That is, if you're willing to accept that the expected location of Kennedy's collar was 6 1/2 to 7 cm above the level of his back wound (which Lattimer elsewhere places at the level of his chin) and that twice this amount

of clothing was bunched up at the back of JFK's head!

Now let's factor in that Lattimer accepted the autopsists' conclusion the back wound was 14 cm below the bottom tip of the mastoid process, the bottom of the skull. This means that, in Lattimer's analysis, the *"expected location of the top of the collar"* was as much as 7 1/2 cm (three inches!) below the base of the skull!

That's right, in Lattimer World, the "expected location" of Kennedy's collar was both 7 to 7 1/2 cm below the base of his skull and 6 1/2 to 7 cm or more above the level of the back wound (which Lattimer elsewhere describes as being at the level of his chin). Amazingly, and perhaps inadvertently, Lattimer had proposed that Kennedy's chin was 14 cm below the base of his skull, and that the expected location of Kennedy's collar lay half-way in between.

Now, measure this out on yourself real quick and see if it makes any sense.

It doesn't. Not one iota. Perhaps this helps explain why Lattimer claimed Kennedy was a hunch-back. The man was desperate for something, anything, that could help him explain the problematic measurements. Having Kennedy's back stick straight out would allow the back wound to be 14 cm away from the base of his skull, while still being at the level of his chin. This is insanity in its purest form, or a deliberate fraud, take your pick.

And Artwohl's theory wasn't much better. When one looks at profile pictures of Kennedy on 11-22, and realizes one can establish the level of the entrance on the clothing by using the 1 1/4 width of his collar as a ruler (which I've done on the slide above at the suggestion of Cliff Varnell), one can see quite easily that there was just no freakin' way that enough clothing bunched up on the back of Kennedy's neck to bring the entrance on his clothing in line with Artwohl's make-believe entrance at the base of Kennedy's neck.

Still, some folks are slower than others. In December, 2009, single-bullet theorist David Von Pein revealed that despite everything demonstrated on the slides above, he, in keeping with his hero Vincent Bugliosi, still felt the Croft photo demonstrated that Kennedy's jacket was bunched up enough to lift the bullet entrance on the clothes up to the level of the entrance location proposed by Robert Artwohl on Kennedy's back.

End of the Line

Since single-bullet theorists continue to claim that the Croft photo, at right, demonstrates the bunching of jacket necessary to lift the bullet entrance on the clothes up to the entrance location on Kennedy's back proposed by Dr. Robert Artwohl (at the level of the dark blue line above), it is important to establish the entrance on the clothes in the Croft photo. The red line and star on the 11-22-63 AP photo at left mark the level of entrance on the clothes, 5 3/8 inches below the top of the collar. A line this same length has been broken in two on the Croft photo at right. This shows that even IF the clothing in the Croft photo bunched up directly behind JFK's head, it is still not enough bunching to lift the hole on the clothing to the Artwohl entrance.

End of the Line

And so I dedicate the slide above to Von Pein and his quite "Vince-ible" hero Vince.

After matching up the AP photo of Kennedy on 11-22 with the Croft photo taken just seconds before he was shot, and using the width of Kennedy's collar to measure the distance down his back on the AP photo, I was able to establish the length of a straight line stretching to the entrance on the clothes. I then broke this line into two parts, and placed them along the outside of Kennedy's jacket profile in the Croft photo. This proved, once and for all, that EVEN IF the "bunching of clothing" visible in the Croft photo was not his right shoulder seen at an angle, but clothing directly in back of Kennedy's head bunched straight out, the amount of material involved was still insufficient to lift the hole on the clothes to Artwohl's proposed entrance location. I mean, let's get real. It's not even close.

But will this end of the line put an end to the lyin'?

Bunch o' Baloney

When the Jefferies film was released in 2007, it sparked renewed debate about the "bunching" theory. A low-res depiction of the coat "bunch" is at far left. A much clearer version is to its right.

What went unstated in all the hoopla, however, was that the Jefferies film confirmed two things—not just that Kennedy's jacket bunched up at the back of his neck at times, but that the jacket actually dropped in Dealey Plaza.

Across the bottom row from L to R: an image from the Jefferies film on Main Street, a photo taken by Phil Willis on Elm Street, a rear view of Kennedy in the Jefferies film on Main Street, and a rear view in the film of Tina Towner on Elm Street, just a few seconds before Kennedy was shot.

Bunch o' Baloney

Afraid not. The "bunching" myth, along with Lattimer's "Thorburn theory" and other single-bullet theorist "factoids," lives! On February 19, 2007, a home movie taken of Kennedy in the Dallas Motorcade by George Jefferies was released to the public. From the very first, single-assassin theorists have latched on to its frames, and their depiction of a "bunched" jacket, as the "evidence" they've been waiting for.

They conveniently ignore that the photos of Phil Willis and the film of Tina Towner, taken minutes after the Jefferies film, and showing Kennedy on Elm Street just seconds before he was shot, confirm that no matter how "bunched" Kennedy's jacket was earlier, his jacket collar had dropped back down below his shirt collar, and was not by any means bunched up enough to support the single-bullet theory proposed by so many.

Trapped

When theorists offer that Kennedy was leaning forward when shot, as depicted in HSCA F-46, at left, they miss that this would lift his body in comparison to his jacket, as shown in the images of Marie Muchmore and James Altgens in Dealey Plaza, at right.

Similarly, when they cite the "bunching" in the Jefferies film, at left, as evidence for their theory, they ignore that it proves the jacket dropped in Dealey Plaza. (As demonstrated in this comparison with the Croft photo taken at Z-161.)

A close look at the collar in the Croft photo, at far left and in insert, shows the shirt collar in shadow above the top of the jacket, not hidden as in the Jefferies film.

Trapped

In short, I believe that researcher Cliff Varnell is correct when he proposes that a study of the holes in the President's clothes, when studied in conjunction with the photographic evidence, single-handedly destroys the single-bullet theory (at least as is commonly proposed). Single-bullet theorists are trapped--either they believe the back wound was where the HSCA Panel said it was, and therefore that Kennedy was leaning further forward than shown on the films, or that the back wound was higher than proposed by the HSCA, with more "bunched" clothing than shown in the films. The scenarios are mutually exclusive and neither one is supported by the evidence.

In fact, in recent years, it has become more than clear that most all the evidence offered to support the single bullet theory has been bogus. In December 1991, as a response to the movie JFK, HSCA assistant deputy chief counsel Kenneth Klein wrote an article for the L.A. Times defending the single-bullet theory. He offered four reasons to believe it. First he claimed that Connally's back wound was ovoid, and that this indicated the bullet striking him had first struck Kennedy. Well, as we've discussed, this simply wasn't true. Dr. Baden had used the measurements of Connally's doctor taken after he'd removed some of the skin around the wound instead of the measurements taken before this removal, and this had misrepresented the shape of the wound. Klein then noted the trajectory analysis of Thomas Canning, which was purported to show that the bullets striking Kennedy and Connally all came from the sniper's nest. Well, as we shall see, Canning not only moved the wounds so that the bullet trajectories would point back to the sniper's nest, he actually re-imagined the positions of Kennedy, so

that, in the findings of his committee, Kennedy was leaning further forward when shot in the back than when shot in the head at frame 313 of the Zapruder film. This, of course, is nonsense. Klein then cited the ballistics evidence, and noted that "it was determined that the bullet found on a stretcher at Parkland Hospital had been fired from the rifle recovered from the depository." Well, maybe so, but not by his committee. The HSCA's ballistics experts claimed the assassination rifle had been fired too many times, and that bullets fired down its barrel no longer matched the stretcher bullet. Klein then referenced the findings of Vincent Guinn, and specifically his claim that the bullet fragment found in Connally's wrist came from the stretcher bullet. Well, as we've seen, the scientific community has since rejected Guinn's conclusions, and Klein's boss Robert Blakey has taken to calling Guinn's methodology "junk science".

The single-bullet theory trajectory just plain ole doesn't work. But you don't have to trust me on this. You can measure this yourself.

Do It Yourself

In March, 2007, after reading yet another online defense of the single bullet theory using a comparison of the back wound photo and the left lateral photo as "proof" that the back wound was above the throat wound, I decided to kill this argument once and for all. This argument, first pushed forward in the January 26 1967 report of the autopsy doctors, then repeated in 1968 by the Clark Panel, and then resurrected by Dr. Artwohl and spread throughout the internet from the website of John McAdams, (from whence, apparently, it infected Vincent Bugliosi) just infuriates me. It infuriates me because these men, supposedly respectful of the official record, used their subjective impressions of the relative

sizes of two photos in order to come to a conclusion about a wound's location, rather than use the ACTUAL measurements taken at autopsy. As Artwohl, McAdams, and Bugliosi have no forensic background and could simply be mistaken, we can give them the benefit of the doubt. That the doctors in the 67 "military inspection" and the Clark Panel made the same mistake, however, is highly suspect.

As both the autopsy doctors and the Clark Panel agreed that the back wound was 14 cm below the bottom tip of the right mastoid process, all I needed to establish the location of the back wound was a model and a ruler. I decided to use myself. In looking around my apartment, I found that the long measurement of a typical CD jewel case is a little over 14 cm. (At 141 mm it was less than 1% larger than 14 cm, which was okay because I am 76 inches tall--6% taller than Kennedy, and have a reasonably long neck.) I then placed it across the back of my neck, with the top edge up against the base of my skull (the location of the bottom tip of the mastoid process). And guess what? The bottom of the CD case was clearly on my back, inches below the entrance on the Rydberg drawings and INCHES below the entrance proposed on the left lateral photo in the 67 inspection, the Clark Panel inspection, and by Artwohl. It's not even close. The location is so far off, in fact, that it's really difficult to believe that Humes and Boswell could ever have believed that the wound in the Rydberg drawings was 14 cm below the right mastoid process.

They probably never did. Harold Weisberg, in his 1975 opus *Post Mortem*, recounts that he, too, measured 14 cm from his mastoid and found this location to be on his back. He tells us, furthermore, that he double-checked this with Dr. Malcolm Perry, Kennedy's emergency room doctor, and that Dr. Perry told him "that his plotting of these measurements makes it a back wound." This is interesting because a 12-11-63 report by the Secret Service's Elmer Moore reflects that he met with Perry and showed him the autopsy report and its measurements and found that the proposed missile path for the first bullet to strike the President was "from the upper right posterior thorax to the exit position in the low anterior cervical region" and was "in slight general downward direction." This is especially interesting, moreover, because Dr. Perry was asked in his testimony before the Warren Commission how a wound 14 cm below the mastoid process would align with the wound he saw on the President's throat, and replied: "In view of the fact there was an injury to the right lateral portion of the trachea and a wound in the neck if one were to extend a line roughly between these two, it would be going slightly superiorly, that is cephalad toward the head, from anterior to posterior, which would indicate that the missile entered from slightly above and behind."

It seems doubtful Perry would unreservedly describe it as a back wound later if he honestly believed it to be above the throat wound when talking to Moore, and "a wound in the neck" when testifying before the Commission. Of course, the "slight general downward direction" mentioned by Moore and the "slightly superiorly" testified to by Perry might have been "extremely slight and nearly non-existent" in Perry's mind.

And then there's another possibility...raised when one looks at the exact wording of the question asked Perry, and then his response.

Mr. SPECTER - Based upon a point of entrance in the body of the President which I described to you as being 14 cm. from the right acromion process and 14 cm. below the tip of the right mastoid process and coupling that with your observation of the neck wound, would that provide a sufficient basis for you to form an opinion as to the path of the bullet, as to whether it was level, up or down?

Dr. PERRY - Yes, it would. In view of the fact there was an injury to the right lateral portion of the trachea and a wound in the neck if one were to extend a line roughly between these two, it would be going slightly superiorly, that is cephalad toward the head, from anterior to posterior, which would indicate that the missile entered from slightly above and behind.

Well, Specter refers to the throat wound as a neck wound, and Perry responds by stating that a line connecting the trachea wound and the neck wound pointed back in the general direction of the head. If Perry is calling the wound 14 cm below the mastoid the "neck wound," as surmised, he is indeed supporting the accuracy of the autopsy doctors and claiming the shot came from above. If, however, he is using Specter's terminology and calling the throat wound the "neck wound" and stating that the wound on the throat, when lined up with the trachea wound, pointed back upwards toward the head, then his answer is non-responsive to Specter's question. He is refusing to tell Specter where a wound 14 cm below the mastoid would be, and is telling him instead that, from what he observed, the trachea wound was above the throat wound, and the "missile" (which can be taken as an indication he's still not convinced it was a bullet) MUST HAVE come from above. If so, and this is indeed what Perry is stating, then it follows that he knew a wound 14 cm below the mastoid would not be well above the throat wound, as suggested by the autopsy doctors, and is trying not to put his observation into the record.

In any event, Perry's statements to Moore, Specter, and Weisberg make it clear he knew the Rydberg drawings were gross misrepresentations of Kennedy's wounds. His silence on this matter in the years prior to 1978, when the drawings were officially debunked, is, therefore, disappointing. In 1967, when Dr. Humes went on TV and told the nation that the autopsy photos showed the back wound to be exactly as depicted in the Rydberg drawings, Perry (and no doubt dozens of other curious doctors) most certainly knew that the wound depicted in the drawings was inconsistent with the autopsy measurements, and that, therefore, either Humes' autopsy measurements were incredibly inaccurate, or he was lying to the nation. And yet, as far as I can tell, not one of these doctors said anything about this to the media! No. Not even when Dr. Lattimer moved the back wound in the Rydberg drawings--already far too close to the mastoid process to be in agreement with the autopsy measurements--INCHES CLOSER to the mastoid process in the drawing he created and published in article after article, year after year, (while still touting in personal letters that "the wound on the back of the neck that I described was certainly the one 14 cm. below the mastoid process") did anyone break their silence, and point out to their colleagues that Lattimer was dishing up manure.

As a result, I can't decide if the AMA is AMAzingly gutless, or AMAzingly brainless, but it is certainly AMAzing and missing something of vital importance.

If the Rydberg drawings were deliberate misrepresentations, of course, it suggests a larger conspiracy than previously discussed. Since the 67 inspection and Clark Panel inspection were both performed for the Justice Department, and under its direction, and both told the same demonstrable lie about the back wound being higher than the throat wound, the finger points directly at the Johnson Administration. Orchestrating a cover-up, of course, does not prove guilt of the initial act. But one should question why such a reckless and politically dangerous cover-up was performed, if not to cover-up something even more sinister.

I better stop here before I start sounding like one of those dreaded "conspiracy theorists."

Chapter 12b: Bullshit and Beyond

A micro-scopic look at the most recent televised depictions of the single-bullet theory. It seems false advertising isn't restricted to the commercials.

Untru TV

In 2003, Court TV, which would later change its name to Tru TV, offered its own depiction of the Kennedy assassination bullet trajectories. A little dramatic license appears to have been taken. The animators had the limousine driving along the white line before the first shot (as seen at left).

Then, just in time for the second shot, they had the limo swerve to its left, thereby aligning Kennedy with Connally for the single-bullet shot (as seen at left).

The limo then swerved to its right, aligning JFK with the crack on the windshield, just before the head shot (as seen at right).

An AP photo taken between these two swerves, however, shows the limo still driving along the white line (as seen at left).

For reasons beyond my grasp, the first image in each chapter sometimes fails to appear. If there's nothing up above, don't despair; you can still see the image [here](#)

Untru TV

In 2003, Court TV was guilty of gross misrepresentation. During the Forensic Files episode entitled JFK: Investigation Reopened they jumped on the deceptive animation bandwagon and defended the feasibility of the single-bullet theory. Of course, to do this they had to lift the back wound above the shoulder line.

They had a few other tricks up their sleeve, as well. The animated segment of the limousine on Elm Street began with the limousine driving straight down the right side of the middle lane. A moment later, however, just as the shot purported to hit Kennedy and Connally was fired, they portrayed the limousine swerving sharply to its left, briefly crossing the white lines of the lane. This brought Connally's armpit in line with the trajectory of a bullet fired from the sniper's nest and exiting Kennedy's throat. The car then swung back in the other direction. This allowed them to better align the location of the crack on the windshield with Kennedy's head and the sniper's nest at the moment of the head shot.

As no one testified to these swerves and as these swerves are not visible on any of the films, the creators of the animation, Hatchling Studios, were clearly of the mind-set that it was more important to

have the shots line up than to accurately depict the path of the limousine. In an online press release dated November 17, 2003, Marc Dole, president of Hatchling Studios (AKA M2-3D), explained: "By combining the film with other data sources, including *personal interviews with local JFK experts*, we were able to create multiple animations-in only eight days-to yield an extensive recreation of downtown Dallas on that day. Now, for example, you can see a head-on view of the president's Lincoln in the motorcade, and you can draw a straight line from the sixth floor of the book depository to the back of Kennedy's head. We also produced a view of the president's limo from Oswald's perspective. It's dramatic, even a bit spooky, but it's also very useful and instructive data." One can only wonder who these "local JFK experts" were, and one can only guess who they believed fired the three shots heard in Dealey Plaza.

In 2007, Court TV changed its name to Tru Tv. As Tru Tv's new motto is "Not Reality. Actuality." I anxiously await their defense of the "actuality" of their animation.

BULLSHIT!

At left, CE 903, the Warren Commission's depiction of the single bullet trajectory, with the bullet descending 17 degrees from the sniper's nest. Due to the angle of the camera, the rod appears to descend at 20 degrees.

So why did the producers of the TV show Bullshit depict the rod descending 15 degrees? (Above) And why did they use a big fuzzy line that disguises that the back entrance at the bottom of the line and throat exit at the top of the line fail to align with the wound in Connally's armpit? (Top line at left) And why did they fail to tell their viewers that the entrance used in the "FBI Recreation" was subsequently found to be two inches too high, and that a trajectory using the corrected entrance and angle from the sniper's nest would exit the Kennedy stand-in's chest? (Bottom line at left) Were they "Bullshitting" their audience?

Bullshit!

Another program to deceive its audience was the Showtime program appropriately entitled Bullshit. While this series normally debunks marginal beliefs by shining a little logic in their direction, in its 2005 episode "Conspiracy Theories" the producers opted to lump all conspiracy theories together and conclude they all are bullshit. While this is ludicrous on its face, as conspiracies have been known to exist and as each theory should be judged on its merits, the producers out-did themselves by trying to prove that Oswald acted alone. Not that cable TV programs are under any obligation to reveal the

lineage of their creators, but they failed to tell their audience that the producer of their show, Mark Wolper, is the son of David Wolper, the producer of *Four Days in November*, an Academy Award-nominated film on Kennedy's assassination, made with the cooperation of the Johnson Administration.

To demonstrate that the single-bullet theory works, the program used a photo from Arlen Specter's May 24, 1964 test of the theory. Knowing full well that Specter and the Warren Commission had little credibility with their audience, they hid their involvement by inaccurately describing the photo as an "FBI re-creation." Even worse, they failed to tell their audience that the back wound location used in that photo was not only higher than the mark originally put on the JFK stand-in's jacket, but later determined to have been two inches higher than Kennedy's actual wound. In addition, the angle of descent in their depiction was too small. In short, they fed their audience bullshit.

Unfortunately, such misrepresentations are so commonplace these days they're barely even noticed. In 2003 a Discovery Channel program entitled "The JFK Conspiracy Myths" attempted to show that Oswald had enough time to perform the shooting by having a sharpshooter on a scaffold shoot at watermelons riding in a remote-controlled limousine. That the sharp shooter hired by the program, Michael Yardley, was able to hit a moving target 3 times in 7.87 seconds (longer than the Warren Commission's favored scenario) was supposed to prove that Oswald, who hadn't fired his rifle in months, if ever, and who had never been trained in shooting at a moving target from an elevated perch, would have been able to accomplish a similar feat. While the program mentioned that Yardley fired six other sets of three shots, and that four of these proved successful, with the other two marred by equipment failure (the rifle jammed 5 times in 21 tries), they failed to mention the timing of these other sets. This leads one to suspect the other sets took longer than the already too long 7.87 seconds quoted in the program. Even worse, when it came time to test the accuracy of Yardley's shooting, they provided him with a rifle hooked up to a laser switch. As a laser beam travels at the speed of light, making it dramatically easier to hit a moving target, and as a laser beam suffers no bullet drop or wind resistance, and as a laser rifle offers no recoil, making it easier to shoot and re-aim, this was akin to playing with a stacked deck.

As if the clear but unacknowledged point made in the program--that the shooting of Kennedy by Oswald was possible, but not likely--needed any clarification, its sharpshooter Michael Yardley wrote a short article on his experience entitled "Who Shot John F. Kennedy? It was me" that was published in his native England. While claiming he believed Oswald had indeed "fired three shots from the depository," he expressed serious doubts that these were the shots striking Kennedy, as he also claimed that the head shot, "if taken from the Grassy Knoll, Badgeman or Walkway positions (all positions forward of the presidential vehicle) would have been much easier" and that "practical experience of the second gunman positions leads me to suspect that there could well have been another shooter." He then closed his article with "Of what can one be certain? That Oswald was a patsy." Of course, none of this was mentioned in the program.

Still, as deceptive as the Discovery Channel (more like the Conceal Channel or the Mislead Channel) was in 2003, it was only warming up.

“Beyond the Magic Bullet” Magic

All exhibits from JFK:
Beyond the Magic Bullet

“Beyond the Magic Bullet” Magic

In 2004, the Discovery Channel began running a new program entitled JFK: Beyond the Magic Bullet. While appearing authoritative, using scientists and experts to simulate the shooting in Dealey Plaza, the program was rife with errors and/or distortions. Ultimately, it demonstrated reasons to disbelieve the magic bullet theory, but then turned around and claimed the opposite!

They simulated the shots from the sniper's nest by placing their shooter on an elevated platform, at a distance of 180 feet, the distance they claim the HSCA claimed for the second shot. Well, there are two problems with this: one is that the HSCA claimed the shot came at around Z-190, which according to the Warren Commission's recreation, would make it roughly 160 feet, and two is that the Dale Myers animation they used as evidence depicted the shot at Z-224, which would make it roughly 190 feet. It's unclear where they derived their 180 foot measurement, but the Warren Commission, which failed to pick an exact moment for the shot, estimated the length of the shot to be 180 feet.

They then shot through a gelatin block simulating Kennedy's back and neck to see if the exiting bullet would leave an elongated entrance like the one they claimed was on Connally. (Following the well-worn path of Dr.s Lattimer and Baden, previously discussed, they incorrectly believed the bullet was traveling sideways upon impact with Connally). When the bullet headed straight through the gelatin

with scarcely a wobble, they decided to add rope into the gelatin to better simulate the "dense sinu" of the human neck. There is a huge problem with this: Dr. Humes et al testified that the bullet striking Kennedy's neck passed between the strap muscles, and not through them. Their second try, not surprisingly, created the wound desired. They then expanded their test to include two gelatin blocks representing Connally's chest, and were similarly pleased with the results.

They then began to shoot at simulated human torsos. After shooting on some empty shells, they placed a target on a fully-simulated torso of the President at a point several inches to the right of the wound seen on the autopsy photos. They claimed this placement came after "triple-measurement." What they failed to mention was that the autopsy measurements reflected the distance from the shoulder and from the back of the head and that their torso had no head. The HSCA and Clark Panel made estimates as to the distance from the spine, which they clearly ignored. Even so, the shooter missed this target and actually hit the torso very close to where the wound is depicted on the autopsy photos. (See Exhibit 1 on the slide above.) I'd like to think this "miss" was on purpose.

But this was just the beginning of their troubles. Since their "magic bullet," after traversing simulated torsos of both Kennedy and Connally, failed to explode the simulated wrist to the extent Connally's was damaged and actually bounced off the simulated thigh, they had to look for it in the surrounding brush. They found a clearly deformed bullet several yards to the right of the torsos. (See Exhibit 2 on the slide above.)

During a slow-motion replay of the shooting, moreover, the narrator stated as a matter-of-fact that the bullet "struck Kennedy in the neck." Someone should have told the writer that that particular lie, although an all-time favorite, died with the HSCA. At this point, the direction of the program became obvious. While one of the great controversies surrounding the single-bullet theory is whether or not a bullet striking Kennedy in the back from above would exit his throat as purported, the program failed to show a close-up of the bullet's exit from the Kennedy torso. Nevertheless, the profile shot of the bullet's path made it clear the bullet exited from the Kennedy torso's chest, and not its throat. (See Exhibit 3.)

They then conducted a post-mortem to see what went wrong with their simulation. After taking the Connally torso to a doctor for a cat-scan, they concluded that the bullet struck two of Connally's ribs instead of the one struck by the "magic bullet" and that this was why their bullet was more damaged. Still, the cat-scan revealed more than the producers of the show could possibly have desired.

The cat-scan (Exhibit 4 above) revealed that the two damaged ribs on the Connally torso were the 8th and 9th ribs, some distance below the entrance on Connally's 5th rib. This demonstrated once again that the bullet trajectory from the sniper's nest didn't quite line-up with Kennedy's and Connally's wounds.

But this wasn't all the cat-scan revealed.

Astonishingly, (and as seen in Exhibit 5) it also revealed that the simulated ribs on the Connally torso were not even connected to the sternum! This meant that there was no bones in the front of the Connally torso to slow or damage the "magic bullet" before it struck the simulated wrist.

Since the purpose of the simulation was purportedly to see if a bullet creating Kennedy's and Connally's wounds might emerge as undamaged as the "magic" bullet, CE 399, removing bone from the purported path of the bullet was undoubtedly deceptive and dishonest.

At this point, I ran a quick replay. I went back to the beginning of the program where they created the torsos and noticed this time that the Kennedy torso had no spine, and that neither torso had shoulder blades. While these bones may have been left out because the producers believed the real "magic" bullet missed these bones, the exclusion of Connally's front ribs, where the bullet made its exit, was inexcusable. That this was no mistake is confirmed by the statements of their wound ballistics expert.

When they were preparing for their torso shoot by shooting at two gelatin blocks simulating Connally's chest, he said "The thorax is not one piece of muscle. It is a piece of muscle, some bone, then an airspace--the lung--and then another piece of tissue after that." It's almost certain he knew perfectly well that the bullet exiting Connally's chest exited through his fifth rib, and not through just "another piece of tissue".

It then became clear. Rather than testing if a bullet hitting the President in the assumed location would go on to hit Connally in his armpit, wrist and thigh, and come out largely unblemished, the program's creators were testing if such a bullet, *after missing Kennedy's spine*, which is doubtful, *after exiting Kennedy's throat*, which is doubtful, and *after hitting Connally's ribs in only one place*, which is doubtful, would go on to create the other wounds and appear unblemished.

As if that wasn't bad enough, the program's creators neglected to tell their audience the significance of that which they did discover. That the tumbling bullet in their re-enactment hit two ribs while the bullet striking Connally stuck but one suggested that the bullet striking Connally was not tumbling. This supported the statements of Dr. Robert Shaw, Connally's doctor, who said the entrance wound was only 1.5 cm long. It was, however, in direct contradiction with all too many single-assassin theorists, including the HSCA's Dr. Baden, who cite the fact (which is not a fact) that the bullet was tumbling as evidence that the bullet first struck Kennedy. These single-assassin theorists, and the Discovery program under their influence, repeat like a mantra that the entrance in Connally's armpit was 3 cm, the size of a bullet traveling sideways, and ignore Shaw's statements that the wound was but 1.5 cm and the inconvenient fact that the corresponding tear in Connally's jacket was only 1.7 cm. (As discussed in the Ovoid? Oy Vey! section of chapter 11.)

In any event, instead of telling the audience the significance of the bullet hitting two ribs, the Beyond the Magic Bullet program cut to some supposed expert stating that their simulation had taken the "magic" out of the "magic bullet".

But the program wasn't over. For their final act they took an autopsy report reflecting the wounds incurred by their simulated torsos to an L.A. County Coroner. Surprisingly, the face sheet created for the Kennedy torso revealed that the bullet exited not from the torso's throat but from its left chest, and that it probably would have hit its spine (if it had one) and must have hit its sternum (if it had one). (Exhibit 6 above.) Even worse, a probe poked through a skeleton by the doctor to depict the path of the bullet exploded the program's assertion of replicating the magic bullet, as the probe passed *below the clavicle and first rib*. (Exhibit 7.) A bullet traveling on such a trajectory would not have bruised the President's lung, but pierced it, and would have exited far below his throat.

And that wasn't even the worst of it. A close-up on the autopsy report reveals that the simulated Connally back wound, in which two ribs were struck, measured 50 mm x 45 mm. The doctor then describes it as a "keyhole" entrance. This is a far cry from the reportedly "ovoid" entrance on Connally, measuring roughly 38 by 16 mm (1.5 X 5/8 inches), and more than suggests that the bullet striking Connally was not tumbling as the bullet in the re-enactment, and that the magic bullet theory is suspect.

In conclusion, one might state that the Discovery Channel did recreate the magic bullet, if one is to acknowledge that magic is deliberate deception designed to create the illusion that fantastic events have taken place.

Dr. Zimmerman's Magic Bullet

X-ray depicting the location of the marker while the stand-in was standing.

HSCA Figure 24: red stars reflect the positions of the marker before and after the stand-in sat down. Blue lines reflect the level of the collar at right and level of entrance, above.

X-ray depicting the location of the marker while the stand-in was sitting

All images except HSCA Figure 24 borrowed from JFK: Beyond the Magic Bullet

The lateral x-ray after the throat marker was added. The ruler reflects a 17 degree descent.

A quick comparison of the lateral x-ray with the HSCA's trajectories, with matching descents of 30 degrees.

The angle of descent presented at the close of Zimmerman's segment. Now only 13 degrees.

Dr. Zimmerman's Magic Bullet

In March 2006, after being told for the third time in as many months by a friend or relative just how impressed they were by Beyond the Magic Bullet, I re-watched the program for the third time. Well, maybe the third time's the charm, because on this viewing I noticed that one of the worst segments in the program involved a man with whom I'd come in contact via the alt.assassination.JFK newsgroup: Dr. Chad Zimmerman. I decided to review the segment and note its inaccuracies and/or deceptions, and record Dr. Zimmerman's responses to my observations. I thought it might prove informative to those wondering just how deceptive TV programs get made and how suspicion and distrust can be spread by these programs.

At the beginning of his segment, Dr. Zimmerman attaches a marker 4 inches from the collar of a striped shirt. This represents the entrance on Kennedy's shirt. Dr. Zimmerman then x-rays his JFK stand-in while the man is supposedly wearing this shirt. Problem: the shirt is now a solid color. When asked about this, Dr. Zimmerman explained that it was the same shirt but that the camera couldn't pick up the stripes from more than a few feet. On this I suspect he is correct. On 3-14, however, he volunteered: "We took many takes of almost everything we did. Let me explain further. For instance, when he (the director) asked me to glue the marker to the shirt, I didn't know he just wanted me to act as though I was. I actually did it. So, to retake the shot, he had me use a portion of the tail of the shirt in close up

to get a shot of me marking the shirt.” Thus, while the casual viewer would assume that the marker on the x-rays is the marker they just saw placed on the shirt, this is not so. The marking sequence has been re-staged. There is, in fact, nothing to indicate the marker on the shirt has been placed 4 inches down from the collar. The only shot of the stand-in getting x-rayed in this sequence shows the stand-in from the front with a jacket over the shirt.

Dr. Zimmerman then shows the result of this x-ray. The marker rests at the level of T2/T3, far down Kennedy’s back. This supports that Dr. Zimmerman has indeed placed the marker 4 inches down from the collar. He then has his stand-in sit down in a chair and elevate his elbow in an attempt to replicate Kennedy’s position in the car. Things get strange, however, when he x-rays the stand-in in this position and puts the x-ray up on the light box. For when the camera zooms in on Zimmerman examining the x-ray, it appears to be a different x-ray than the one he just put up on the light box! Furthermore, the marker on the x-ray has jumped from T2/T3 on the “standing” x-ray to C6/C7 on the “sitting” x-ray, a difference of more than two inches! Does it make sense that the clothing in the middle of a man’s back would rise almost 2 inches higher than the flesh beneath it, just by his lifting his elbow a bit? (The Anatomy of Deception slide will examine this more closely.)

Dr. Zimmerman then announces that the marker has been lifted to the “very lower cervical or neck portion of the spine. This is the same point that the House Select Committee on Assassinations placed the entrance wound.” Oh really? Dr. Humes’ autopsy report, to which Zimmerman usually defers, asserted that the wound was in “the upper right posterior thorax.” (Thorax means “the part of the body *between* the neck and the diaphragm”, last I checked; thus, by definition it is *not* the neck, but *below* the neck). Furthermore, the HSCA medical panel never wrote that the bullet entered in the lower neck and all the drawings they created showing the back entrance, HSCA Figure 24, HSCA Exhibit F-46 (Figure 12 in the final report), and HSCA Figure 65 depict the wound on the thorax, at the level of T1. When I pointed this out to Dr. Zimmerman, he responded “The entrance, imo, was at the junction of the neck and upperback-C7-T1. Conceivably, one could say lower neck or upper back to reduce confusion to the viewer/reader. This is based on the known autopsy findings and the x-ray findings.” Wishing doesn't make it so. There is no report of a C7-T1 entrance on any of the HSCA radiology reports that I can find. Doctors McDonnell and Davis both note air in the tissues around C7-T1 and a fracture of the T1 transverse process, but never mention observing an entrance at C7/T1.

Back to the program. At this point, the “standing” and “sitting” x-rays are shown side by side, demonstrating how far the marker has climbed with the slight lift of an elbow. But there’s a problem. The “after” x-ray is not the one Dr. Zimmerman just examined, but the one he originally put up on the light box. (This is discussed in more detail on the Pareidolia slide.) Dr. Zimmerman then attaches a marker to his stand-in’s throat. While his stand-in appears to have a longer neck than Kennedy, the placement of this marker appears to be accurate. Dr. Zimmerman then attaches (or appears to attach) a marker on the outside of the stand-in’s jacket. The stand-in’s hand blocks us from seeing whatever Zimmerman is doing. In any event, when next we see the jacket, there is a large piece of tape across its back. Zimmerman then takes a lateral x-ray of his JFK stand-in in the sitting position. (This is discussed in more detail on The Anatomy of Deception slide.) He then places a ruler below the locations of the jacket, shirt and throat markers on this x-ray. The ruler is at a 19 degree angle on the TV screen. The x-ray, however, is at a 2 degree angle on Zimmerman’s light box, meaning the downward trajectory on the x-ray is really only 17 degrees.

Zimmerman then says “If we were to draw a line on those 3 points we would get a line consistent with a trajectory published by the Warren Commission Report, and in a very similar portion of the neck.” As Zimmerman says this, however, the x-ray he’s discussing is inverted and presented side by side with a drawing from the HSCA’s trajectory analysis! This is undoubtedly confusing. The only depiction of the single bullet theory in the Warren Report, CE 385, depicted a 13 degree descent; the HSCA

trajectory analysis, on the other hand, portrayed a much steeper 25 degree descent. Even worse, with the inversion, Zimmerman's x-ray has been compressed laterally, so that the 19 oops 17 degree descent has now become a 30 degree descent. Even stranger, the HSCA trajectory drawing is depicted at an angle, so that its 25 degree descent now appears to match the x-ray's 30! When asked what he meant by saying that the x-ray matched the trajectory published by the Warren Report, Zimmerman responded "I never said it was the same as they drew. It was very close to the angle published in the WC from the sniper's nest at frame 225. I wasn't citing a drawing as proof of anything. The angle measured and published by the WC was 20 degrees. Subtract 3 for the decline of Elm St. and you get 17 degrees, which is very near what the x-ray demonstrated. Certainly, there is an allowable degree of error since we weren't trying to exactly duplicate anything. That would be impossible." When I asked him why the program's creators over-dubbed his comment about the Warren Commission onto an HSCA trajectory, he responded "Talk to them. I didn't have anything to do with the editing process. Not sure that it really matters, it appears to be quibbling over minutae (sic)."

(Years later, on March 25, 2008, when asked by Robert Harris the simple and relevant question of why the producers didn't show the back of the shirt or jacket as the stand-in sat down, so that the audience could see the upward movement of the marker for themselves, Zimmerman had a similar response: "Bob, perhaps you should write the Discovery Channel a letter. I wasn't doing the directing or filming, nor did I have anything to do with editing. Do you understand that?" When a persistent Harris countered by asking why such a "complex ritual" was performed to show the lifting of a marker as a man sat down, Zimmerman once again deferred "Ask the producer, Bob. I didn't have anything to do with the filming whatsoever.")

Zimmerman's segment then comes to a close. While a downward angle is drawn across a photograph of Kennedy, the narrator declares: "The angle of trajectory is clearly downward. It fits with a shot that came from the sixth floor of the depository." The problem with this is that the angle of descent drawn across Kennedy's photograph is 13 degrees, only slightly smaller than the 17 degree descent indicated on Zimmerman's uncompressed x-ray, but far smaller than the 30 degree descent just shown. Even worse, the back entrance depicted in this photo is just below Kennedy's collar, and almost on his neck. This is confusing when one considers that the program began with Zimmerman telling the audience that the entrance was 4 inches BELOW this collar. When I asked Dr. Zimmerman about this 13 degree trajectory, he was dismissive of its relevance. He wrote "Again, does that really matter that much? Not really."

Throughout our exchanges, he continued to defend the program, first writing about how good it was, and then, when I was able to point out how inconsistent it was, writing that these inconsistencies didn't really matter. On 3-8, he wrote "Trying to replicate something exactly is almost impossible. However, they've taken the closest look at it that I've ever seen and it certainly appears feasible, if you actually look at all the factors that explain why something happened on the show the way it did." On 3-13, he continued to defend the program, but in more muted tones, stating "They were just illustrating a concept of a downward trajectory." When I asked if he felt the mistakes and/or deceptions were deliberate, he said "Mistakes, probably. All programs have them. Deceptions? That is up to the viewer. Your (sic) quibbling about a couple of degrees here and there...I seriously doubt that anything was done to intentionally mislead the viewer. After all, how many are going to sit with a protractor and measure angles? Perhaps just you." He could very well be right on that point.

The Anatomy of Deception

Perhaps Zimmerman's right. Perhaps I'm quibbling over minutiae. But there are segments in the program and Zimmerman's segment in particular that just look wrong to me. So let this be a test. I'll present some things that look wrong to me, and I'll let you be the judge if I'm being too picky or not. This slide then can serve as either an examination of Beyond the Magic Bullet's deliberate deceptiveness, or my own susceptibility to self-deception, depending on your perspective.

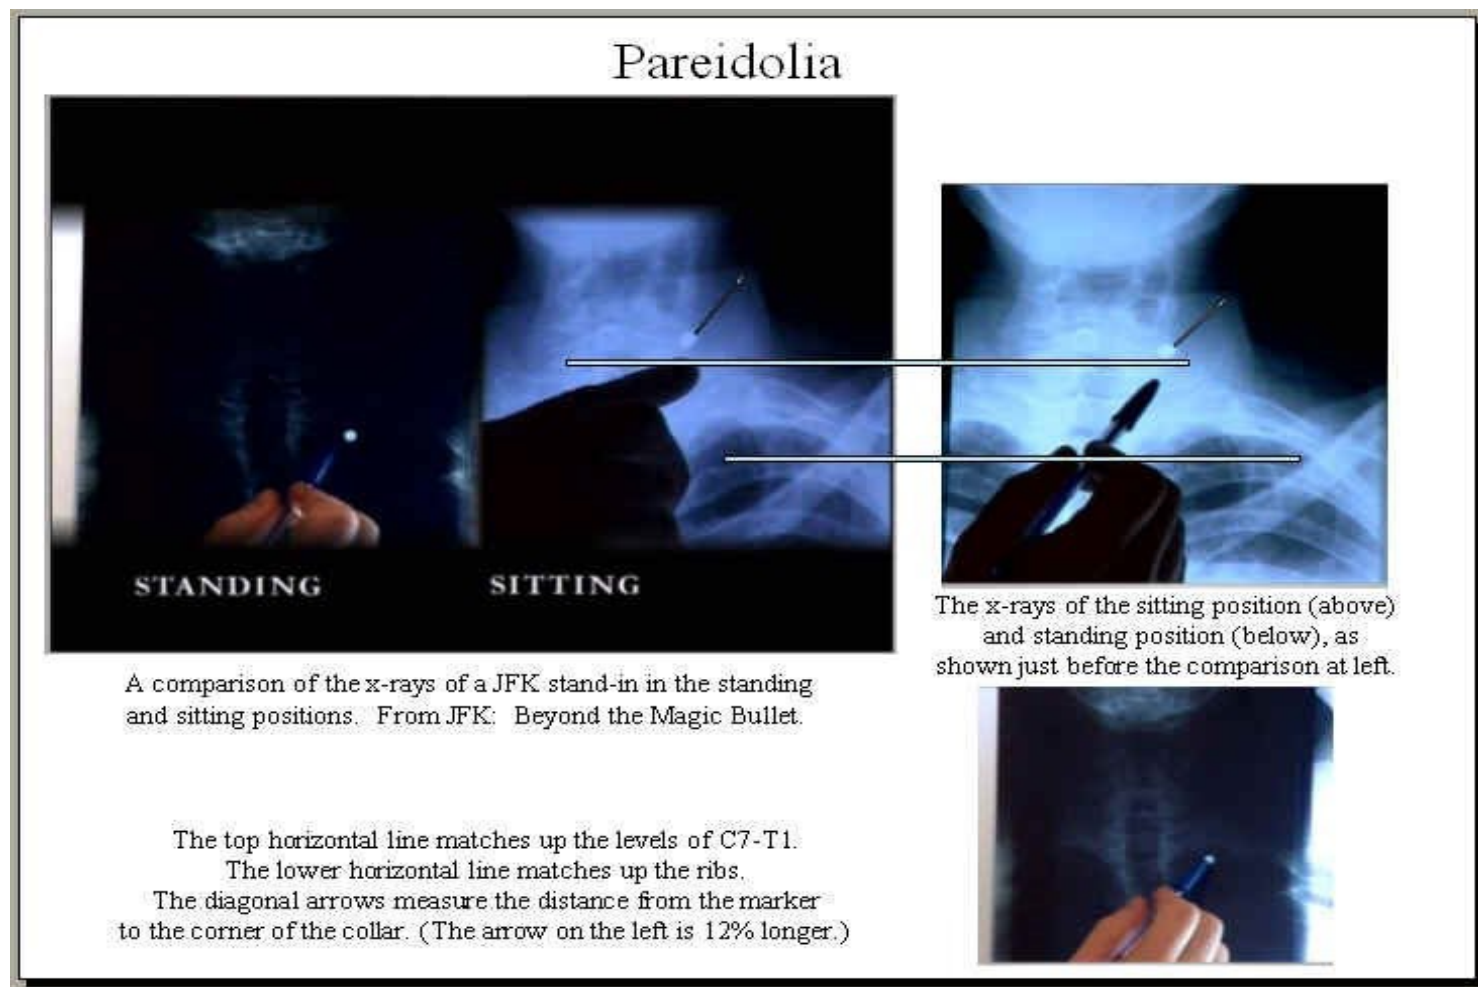

Possible deception #1: when I compare the image of the JFK stand-in preparing to receive the lateral x-ray, with the actual x-ray, my smoke and mirrors detector goes off. While the pre-x-ray photo depicts the stand-in at a slight angle, and the stand-in's back is slightly closer than his front to the camera, the resultant distortion should be relatively minor. When one compares the distance from the collar to the middle of the tape in the photo to the distance from the collar to the marker visible on the x-ray, however, it seems clear that the marker is either above the tape or near the very top of the tape; it is certainly not in the middle. When I project the 5 3/8 inch distance from the top of the collar to the bullet entrance onto the stand-in's jacket, moreover, it appears that the entrance on the clothing should, in fact, be near the *bottom* of the tape. Meanwhile, the throat marker appears to be the marker aligned with the middle of the tape. If this is so, then this is an indication that there was a flat trajectory through Kennedy, with the exit on his throat at the same approximate level as the entrance on his back. This was, of course, the finding of the HSCA medical panel. Did Dr. Zimmerman and the producers of JFK: Beyond the Magic Bullet "re-interpret" their results? Is the unnecessarily large piece of tape a device to fool us into believing the marker's beneath the middle of the tape? Or am I deceiving myself?

Possible deception # 2: when I compare the A-P (front to back) x-ray of the JFK stand-in in the sitting position, with the lateral x-ray of him in this same position, my smoke and mirrors detector goes off once again. Here we have two x-rays purportedly taken with the Kennedy stand-in wearing the same clothes and in the same position, and yet the collars apparent on the x-rays reside at drastically different levels. While the A-P view depicts the top of the collar at roughly C-5, the lateral view depicts it at C-3. From this one might assume someone pulled the collar up to the stand-in's hairline for the lateral view. In the set-up of this x-ray, Dr. Zimmerman is shown standing directly behind the stand-in, with his hands on his shoulders. When I asked Dr. Zimmerman about the variations in collar level between the two x-rays, he explained: "we filmed several series of setups and they did not show the same setup series as was x-rayed, hence the difference between them. However, I don't recall the collar being up in the hairline." I asked about x-rays and he answered about set-ups. Even so, is Zimmerman really admitting that the jacket didn't always "bunch" up the same distance, and that this distance varied from set-up to set-up? Doesn't that undercut the credibility of Zimmerman's experiment? Or am I deceiving myself?

(A 3-25-2008 discussion on the alt.assassination.JFK newsgroup confirmed that, at least in this instance, I'm not deceiving myself. When Robert Harris asserted that Zimmerman's marker and x-ray experiment, if performed by someone else, would have had a different result, Dr. Zimmerman readily agreed, admitting "The little metal marker didn't only have two locations that it could snap into. We weren't using Lego markers, Bob. Therefore, depending on any particular take, it could've ended up at a near infinite amount of locations from about C6 to T2-3. Do you actually believe that there were only two spots that the marker could end up?" By admitting to such a wide range of marker locations, Zimmerman thereby undercut the value of his experiment. Perhaps, in Zimmerman's mind, his experiment was designed to show only that it was *possible* to elevate the amount of clothing necessary for the single-bullet trajectory to align. But this was not communicated in the program, which implied the amount of clothing elevation depicted was the *expected* result.)

Possible deception #3: when I compare the marker in the two "sitting" x-rays, something smells wrong again. Even though the collar in the A-P x-ray rests at C-5, and the collar in the lateral x-ray rests at C-3, the markers are each at C-7! How can this be, if the position of the marker is related to the upwards

“bunching” of the collar? When one considers that the marker in the A-P x-ray resides but a vertical inch or so below the collar, and that this marker is purportedly 5 3/8 inches BELOW the top of the collar, then one should rightly wonder if this marker is even attached to the jacket. For how can 5 3/8 inches of material be crammed into 1 inch of vertical space while draped along a sitting man’s back, without the material doubling over? (We know the material didn’t double over because Kennedy’s shirt and jacket each had but one hole.) When one looks at the clip of the stand-in in this position, moreover, there is no “bunching” of material at the back of his neck visible. Either what appears to be a collar on the A-P view is not in fact a collar, or the marker was not 4” below the bottom of the collar. Some sort of deception has occurred. Or am I deceiving myself?

Pareidolia

Pareidolia is, according to The Skeptic’s Dictionary “a type of illusion or misperception involving a vague or obscure stimulus being perceived as something clear and distinct.” When I compare the “sitting” x-ray examined by Zimmerman on Beyond the Magic Bullet with the “sitting” x-ray shown side by side with the “standing” x-ray, I notice clear and distinct differences: the collar in the x-ray used in the comparison is at a much greater angle; the marker in the x-ray used in the comparison is slightly higher and of a different shape; the marker on the comparison x-ray is also further from the corner of the collar, proving that the x-rays are not the same x-rays seen at a different angles; furthermore, when one rotates the x-rays to make the collars match, one finds that the lower ribs no longer align with one another. The question then is whether these differences are real or purely in my mind. Perhaps the

appearance of a pen in the photo of one x-ray but not the other set off my suspicious nature, and led me to micro-inspect the x-rays, and notice things that simply aren't there.

When I mentioned on alt.assassination.JFK my suspicion that these x-rays were not the same, researcher Anthony Marsh commented that this was "Misdirection." Dr. Zimmerman then responded to Marsh that "The truth is Pat doesn't really know what he is talking about here." Later, he responded directly to my suspicion by stating "Again, this is the difference of distance and the automatic controls of the camera. We took one AP neutral and one AP with the arm raised. They are the same film. However, the MA on the machine was different between the two exposures and one turned out lighter than the other. This produced problems with the camera when looking at the both of them. There was no trickery with the x-rays." When one compares the "standing" x-ray shown earlier in the program with the "standing" x-ray used in the program's comparison, one can see to what Dr. Zimmerman was referring: the comparison x-ray was indeed darker than the other. But this doesn't explain why the *content* of the two "sitting" x-rays differs, does it? The two "standing" x-rays, outside of the difference in contrast, appear to be identical. When one looks at them closely, however, one notices something else that is suspicious: there is no collar visible on this x-ray. Is this just a coincidence? Having a collar visible on the "standing" x-ray in a nearly identical location as the "sitting" x-ray would certainly have undercut Dr. Zimmerman's assertion that the jacket material bunched up two inches with the change in position...

On 3-14 2006, Dr. Zimmerman responded once again to my prodding. Apparently confusing my assertion that the collars in the AP and lateral "sitting" x-rays were at different levels (as discussed in The Anatomy of Deception section above) with my assertion of there being two AP "sitting" x-rays, he wrote "Since I don't have the films handy, I am not sure what you are talking about. However, clothing moves, Pat. That was the point of the demonstration." When I pointed out that I was not referring to the different collar levels of the AP and lateral x-rays, but to the differences between two separate AP "sitting" x-rays, he wrote "I don't know what you're talking about. We didn't take a plethora of x-rays. My guess is you aren't interpreting something correctly." When I asked if the producers took multiple takes of him examining the x-rays, some with a pen and some without, he responded: "I would assume so. We took many takes of almost everything we did.... As far as I recall, we only took a total of 4 x-rays. 2 AP—one neutral and one with the arm raised, 2 lateral films, one with the clothing bunched and one without. The one that did not have the clothing bunched was not used as we were testing the bunching theory." If Dr. Zimmerman had honestly forgotten what procedures he performed for a TV program only a few years before, then we should all be skeptical of the specific memories of the many witnesses to the President's body, both in Parkland and Bethesda. If, however, you believe, as he does, that the two "sitting" x-rays are the same, there's a word you can use to describe my contention that they are not...

Pareidolia: a type of illusion or misperception involving a vague or obscure stimulus being perceived as something clear and distinct.

The Zimmerman Confirmation

At right: the trajectory of Robert Artwohl. Zimmerman uses this same trajectory, in which the bullet entered at level of C-5.

Location of nut after
Location of nut before

Location of nut before
elbow was raised

Location of nut after
elbow was raised.

Image at left from Zimmerman's own website. It refutes his claim that the trajectory below depicts a bullet entering at the level of C-7. Note also that the bullet passes the spine at T-1.

Images borrowed from the website of Dr. Chad Zimmerman.

The Zimmerman Confirmation

Since Marquette University political science professor John McAdams, creator of Google's favorite website on the assassination, endorses Dr. Zimmerman's work on the single-bullet theory, writing "Zimmerman has done some very interesting and informative work on this issue," I decided to go to Zimmerman's website and read all his articles on the subject. I was surprised to find, however, that the articles were filled with as much misleading information as his TV appearance. In fact, when one looks closely at these articles purporting to support the single-bullet theory, one finds they make a better argument *against* the single-bullet theory. That McAdams and other defenders of the single-assassin theory fail to see this is undoubtedly discouraging.

In Zimmerman's 2004 article *The Shirt Experiment*, for example, he details how he attached a nut to the back of his shirt at the approximate distance from the collar of the bullet entrance found on Kennedy's shirt. He then took an x-ray of himself and found that this nut rested at the vertical level of his second thoracic vertebra (T2). Zimmerman then raised his arm into the position he assumed Kennedy's arm was in and found that the nut now rested at the level of the seventh thoracic vertebrae (C7). This means the nut was lifted an inch and a half or more simply by Zimmerman's raising his elbow a short distance. (Clearly, these results impressed the producers of *Beyond the Magic Bullet* and led to Zimmerman's appearance on the program.)

A related experiment was conducted for the HSCA. The HSCA trajectory analysis report says that forensic anthropologist Dr. Clyde Snow conducted "laboratory tests on men of similar build" as Kennedy and that "Because the Zapruder film showed that Kennedy had raised his right shoulder slightly as to place his elbow on the side of the limousine, the resulting movement of skin at the in-shoot location was also assessed. It was found that the wound was approximately 0.1 centimeter higher

and 0.2 centimeter closer to the midplane than the post-mortem photographic observations by themselves indicated.” Taken in conjunction with Zimmerman’s experiment, then, we can use Snow’s results to safely assume that while the lifting of Kennedy’s elbow *may* have lifted his clothing, so that the bullet entrance *may* have been as high as C7, this entrance would have overlay an entrance on the body 0.1 cm lower and .2 cm further from the spine at autopsy than the bullet’s actual trajectory.

Zimmerman’s experiment thereby confirmed that the bullet hole on Kennedy’s body, if consistent with the holes on his clothes, would have been at the very highest the level of C7. In Zimmerman’s 2002 article Anatomy of the Back Wound he asserted that the wound was most likely at the C7/T1 level but appears slightly higher in the autopsy photos due to rigor mortis. Okay. To me the wound is clearly more in line with the T1 theorized by the HSCA pathology panel than C7, but we’ll play along.

Zimmerman runs into a heap of trouble, however, when he attempts to prove that an entrance at this level supports the single-bullet theory. In his 2004 defense of the theory he introduces a profile of the neck taken from an anatomy book. He places an arrow descending at 22 degrees across this profile. Zimmerman writes “A bullet entering at the C7-T1 level of the spinous processes, at a downward angle of 22 degrees, will cross just below the C7 disc and out of a point in the neck and exit at the T1 disc.” This description doesn’t match the trajectory on the profile, however, as the arrow on the profile crosses the spine at T1 and exits just below T1. Even worse, this profile only shows the front half of a person. When one projects Zimmerman’s 22 degree angle back from the exit through a complete profile, one finds that the entrance of Zimmerman’s trajectory is really at C5, considerably higher than where Zimmerman’s analysis of the back wound placed the wound and considerably higher than where Zimmerman’s analysis of the bullet holes in the clothing placed the wound.

If you fail to believe that Dr. Zimmerman’s 22 degree trajectory actually tracks back to a C5 entrance, and not C7, you should consider that it was Dr. Zimmerman himself who convinced me of this. In his 2003 article The Case of the Bunched Jacket, Dr. Zimmerman presents Kennedy’s left profile autopsy photo (inverted) with a 22 degree trajectory through the neck. He does us the favor, furthermore, of adding in the levels of the cervical vertebrae. These demonstrate that the entrance proposed by Dr. Zimmerman, as well as our old friend Dr. Artwohl, is on the horizontal plane of C5/C6.

Somehow, he failed to notice this. Instead, beneath his proposed trajectory through Kennedy he writes “This wound track measures a downhill angle of 22 degrees, similar to a shot from the sniper’s nest in the TSBD building. An entrance at C7/T1 is easily conceived and fits perfectly with the description of the wounds in the autopsy report.” What? While one can “easily conceive” that this 22-degree trajectory entered at C7/T1, and not C5/C6, one can not do so without lowering the exit to Kennedy’s chest. And why, if Zimmerman wants his readers to conceive of a C7/T1 entrance, does he have his trajectory start at C5/C6? Is he being deceptive? Or is he actually contending that this C5/C6 entrance is at C7/T1?

Another intriguing aspect of Zimmerman’s shirt experiment is the left-right movement of the nut on his x-ray. While the photo with the nut at the T2 level shows the nut to be near the middle of Zimmerman’s spine, the x-ray of the nut in this position shows the nut to be noticeably further to his right. As the x-ray depicting the level of the nut after Zimmerman lifted his elbow demonstrates beyond a doubt that the nut was pushed closer to Zimmerman’s spine as his shirt “bunched” (a movement confirmed by his segment in Beyond the Magic Bullet), one can only wonder where the nut in the original photo would have moved. This makes me suspect that Zimmerman took the photos and the x-rays and then re-did the x-rays when the nut in the initial experiment ended up directly over his spine. After all, if the dramatic “bunching” of Kennedy’s clothes that Zimmerman asserts took place would also have lifted the entrance hole on the clothes to a spot overlying Kennedy’s spine, it destroys Zimmerman’s contention that a bullet entering at C7 could have exited Kennedy’s throat without striking bone.

Zimmerman Vs. Zimmerman

Images from Zimmerman's "The Case of the Bunched Jacket." Light blue lines added for ease of comparison.

How does C-4 on one Zimage end up as C5 on another Zimage and C-7/T1 on yet another Zimage?

Approximate trajectory of bullet

Blue arrows represent 17 and 22 degree trajectories through C7/T1.

According to Zimmerman, the pink line at left represents the level of C4. Within the same article he presents the images above and submits that Kennedy was hit at the "C7/T1 area of the back/lower neck." The lower blue line represents the actual "C7/T1 area".

Above: close-up of the middle image at top, demonstrating that the actual entrance in this trajectory is at C5.

Zimmerman Vs. Zimmerman

There are still other problems with Zimmerman's The Case of the Bunched Jacket.

In the beginning of the article, when Zimmerman is attempting to demonstrate that a man's collar rests higher up on his neck than is often believed, he performs a study of various pictures of Kennedy, with blue lines representing the approximate level of the second cervical vertebrae and pink lines representing the approximate level of the fourth cervical vertebrae (C4). Later, he presents the (inverted) left autopsy photo with inserted levels of the cervical vertebra. This image demonstrates that a 22 degree trajectory would need to enter near C5/C6 to exit from Kennedy's throat wound. A few pages later, so he can show where the approximate entrance was on the jacket, Zimmerman presents this autopsy photo with a super-imposed jacket. Zimmerman then writes "With the base of his collar near the C4 level, about 3 inches of fabric would be between the base of the collar and the entry (the bullet entry on the clothes). However, we see that some 4 inches are needed. If the fabric had bunched up only an inch, which is highly probable given the photos we see of Kennedy in the motorcade, then it can be expected that the bullet would go through the suit some 4 inches below the collar and impact at the C7-T1 level."

Well, what's wrong with that, you ask? Only that Zimmerman's "C7-T1 entrance" on his trajectory, which he acknowledges is 3 inches below the collar at C4, is at the same level as the level of C4 and C5 on his other images! When one looks at the Kennedy profile with the inserted cervical vertebrae, moreover, one can project an entrance just below the C7 level onto Kennedy's clothed autopsy photo and see that a bullet descending at 22 degrees and entering at the C7/T1 level would exit from Kennedy's chest, inches below his throat. Not coincidentally, this is where the bullet exited from the Kennedy torso in the re-enactment performed for Beyond the Magic Bullet. The argument can be made,

therefore, that Zimmerman's work and *Beyond the Magic Bullet* jointly demonstrate beyond any doubt that the single bullet trajectory does not work and can only be made to work if Kennedy was leaning forward to a greater degree than can be supported by the photographic evidence.

What's so upsetting about Zimmerman and his inconsistencies is that his website (which strangely went down as my report s on his inconsistencies went up) and TV appearance have deceived tens of thousands of people with an interest in the case, and have driven the two sides of the conspiracy issue further and further apart.

The Problematic First Rib

Above: Zimmerman pointing out the throat exit on *Beyond the Magic Bullet*. Blue arrows represent Zimmerman's trajectory (top) and the HSCA's Forensic Pathology Panel trajectory (bottom). Both head straight towards the first rib.

At left: HSCA Exhibit F-65, portraying the medical panel's conclusion that the bullet passed the spine at T-1. Note that there is no depiction of the first rib.

Above: a demonstration of the single-bullet trajectory by Dr. John Lattimer in his book *Kennedy and Lincoln*. The first rib appears to be missing, even though Lattimer proposes the bullet passed above it.

The Problematic First Rib

Well, why would Zimmerman consistently misrepresent the level of the back wound in his writings and on his trajectories? Why not just pretend there was no problem with an entrance at T1, and that Kennedy was slumped forward when shot, a la the HSCA Forensic Pathology Panel? Well, as discussed in the last chapter, on *The Portable Hole* slide, such a trajectory smacks right into Kennedy's first rib.

Zimmerman undoubtedly knew about this rib, and almost certainly understood its significance. At one point, in his segment of *JFK: Beyond the Magic Bullet* he points to the exit location on a skeleton in his office. And there it is...right in the path of a trajectory heading from an entrance at the level of T1, the first rib. (That a bullet traveling this trajectory could not have passed lateral to this rib is confirmed by

HSCA Exhibit F-376, as well as every other reasonable depiction of a human skeleton.) Zimmerman, a chiropractor by trade and thus one well familiar with the spine and ribs, certainly knows the impossibility of this trajectory, and would find it necessary to believe the bullet entered above this rib before he could let himself get seduced by the single-bullet theory. (Thus, his constant assertion of an entrance at C7/T1 when the HSCA's exhibits make it clear the entrance was at T1.)

Apparently, Dr. John Lattimer was of a similar mind. In his book, *Kennedy and Lincoln*, Dr. Lattimer used a skeleton to depict his single-bullet trajectory. Strangely, however, the skeleton seems to be missing the problematic first rib. Just as curious, this would not be the only time problematic bones disappeared from a Lattimer simulation.

In 1994, Dr. Lattimer wrote an article for *The American College of Surgeons* in which he claimed to have duplicated the lapel bulge apparent on Governor Connally's jacket at frame 224 of the Zapruder film. He described an exacting re-enactment using a simulated neck for Kennedy, a clothed rib cage for Connally's chest, and an "array of radiuses (arm bones), encased in simulated forearms." He fired a 6.5 mm Mannlicher-Carcano bullet through these figures, filmed Connally's jacket bulging outwards, and compared the exiting bullet with CE 399, the so-called "magic" bullet. They appeared quite similar. He compared the damage to the rib cage and wrist of Governor Connally to the damage to his simulated rib cage and wrist. They were also roughly similar. He then fired a bullet through the "Connally jacket and thorax preparation without running it through the model neck first." Not surprisingly, he discovered that as this bullet exited the Connally torso, the bullet did not tumble and the jacket did not bulge. He took from this that in order for Connally's jacket to bulge as it did in Z-224 the bullet would first have had to have struck Kennedy. He then concluded "The bulge and the lapel eversion of the jacket worn by Governor Connally, starting in Zapruder frame 224, does indeed establish, beyond any shadow of a doubt, the exact moment when bullet 399 went through him...It also permits us to establish that there was plenty of time (three and one-half seconds) between the first two shots (frames 160 and 224) and even more time (five seconds) between the last two shots (frames 224 to 313), for Oswald to reload, reacquire his target (the head of President Kennedy) plus two full seconds to lock onto it."

Lattimer was grossly overselling his results, of course. For one, as demonstrated in chapters five through nine, there is nothing to indicate the first shot was fired at frame 160. For two, Lattimer is clearly insinuating he's proved the likelihood of the Single Bullet Theory merely because he shot straight through a clothed rib cage and its jacket didn't bulge! There's no evidence that either of the bullets striking the rib cage in Lattimer's experiment struck it in a manner similar to the bullet striking Connally. In fact, as Connally's rib was shattered for 10 cm and as the first bullet fired in Lattimer's experiment shattered only 4.5 cm, it would appear they did not.

Lattimer's description of the second shot offers further confirmation of his simulation's inaccuracy. He writes: "With the bullet going straight ahead, wounds to the rib, shirt and jacket were punctuate and the rib fragments were not enough to bulge out the front of the jacket." This "punctuate" entrance is a clear indication that the bullet was *not* fired in an effort to recreate Connally's wounds, as a bullet striking Connally at the angle required for a bullet to travel along his rib, as proposed by his doctors, the WC, and the HSCA, would not be "going straight ahead" and would be unlikely to create a "punctuate" entrance under any circumstances. It's clear, then, that Lattimer had no idea whether a bullet striking Connally *in the manner he was actually struck* without first striking Kennedy would have created a visible bulge on his jacket, and had no desire to actually find out.

Final support that Lattimer's article was designed to sell the single bullet theory without actually testing it comes from his description of the simulated neck: "A size 16 neck simulation was created, using fresh pork muscle, *with the bone removed* and the skin still in place." Thus, having the right-sized neck was important, but accurately representing the internal structures of the neck was not. Perhaps

Lattimer was afraid of a bone even more problematic than the problematic first rib: the spine.

But as deceptive as Lattimer's work and Zimmerman's work have been, they come in a distant 2 and 3 to the number one myth-maker of recent times, and the number one salesman for the single-bullet theory: animator Dale Myers.

Chapter 12c: Animania

Searching for Truth in Dale Myers' House of Mirrors

Murder by Cartoon: Old Crone Analysis

Above: Kennedy's actual profile on Elm Street in the Towner photo. His chin is over his chest. At right: Myers' 2003 depiction of Kennedy at Z-224. Here his chin is over his lap.

Above: Myers' 2004 depiction of Kennedy and Connally. Note the drop in Kennedy's collar from 2003. Note also that Kennedy's neck is 20% or more longer than Connally's. Is that accurate?

Across bottom: three different faces of the back entrance, all by Myers. Above image from early 2003.

Above and at right: 2004. Note the moving collar.

For reasons beyond my grasp, the first image in each chapter sometimes fails to appear. If there's nothing up above, don't despair; you can still see the image [here](#)

Murder by Cartoon: Old Crone Analysis

In recent years, the work of digital animator Dale Myers has repeatedly been used to demonstrate the feasibility of the single bullet. The problem: his work is deliberately deceptive at best, and an absolute fraud at worst. Since his animation has so effectively re-invigorated the single bullet theory for so many, we need take a closer look at his work, and clearly demonstrate its deceptiveness.

We'll start by examining what appears to be a contradiction. On the 2003 version of his website, before he decided to single-handedly turn the single-bullet theory into what he has since called the single-bullet fact, Myers portrayed the back wound above his animated figure's shoulder line, in the discredited location of the Rydberg drawings. He even acknowledged he derived this location by projecting Connally's wounds back through Kennedy's throat wound, and that this entrance didn't match the location of Kennedy's back wound on the autopsy photos. Within the next year or so, however, around the time he began supplying ABC with animation for their Beyond Conspiracy special, Myers' website was changed to state that the back wound location used in his animation had

been established through exact measurements, etc.

Now this was not surprising, seeing as the views of Kennedy from behind in Myers new animation demonstrated beyond any doubt that the back wound was now on the back.

When one compares the animation of the moment of the single-bullet's impact created by Myers for 2003's Beyond Conspiracy, with the animation of this moment he created for 2004's Beyond the Magic Bullet, however, there is a surprise. In 2003's Beyond Conspiracy on ABC, a program which, horrifyingly, received an Edward R. Murrow Award for best documentary, Myers' animation depicted Kennedy's collar bunched up at his hairline. In 2004's Beyond the Magic Bullet on the Discovery Channel however the collar was well below the hairline and not bunched up at all. Even more surprising, in 2004's Beyond the Magic Bullet, Myers depicted the bullet entering well down from the collar in one segment and just below the collar in another. So much for consistency.

Murder by Cartoon: Birth of the Crone

Above: Warren Commission CE 385 with its discredited bullet entrance on the base of the neck. The HSCA proved the bullet entrance was 2 inches lower.

Above: Myers' interpretation of the bullet entrance and exit. Although he lifts the back wound from the HSCA entrance, he nevertheless agrees with the HSCA that the entrance was at the same level as the exit, or lower.

HSCA Exhibit F-46, showing the forward lean necessary to have Kennedy's wounds project back to the sniper's nest.

Above: Kennedy in Z-225, with his head erect.

Above: the Myers solution: Kennedy's neck is leaning forward, but not his head! Compare the neck of this Kennedy to the neck of the profile above.

Murder by Cartoon: Birth of the Crone

And so much for accuracy. On his website, on a depiction of the back wound location beneath the

clothing, Myers depicts the back wound above Kennedy's shoulder line, at the base of the neck, exactly where it was in his original animation, the animation he'd openly admitted was inaccurate.

This location is clearly inconsistent with the back wound location used in his depictions of the shooting.

There is an even more surprising aspect to the single-bullet theory depicted on Myers' website. Unlike the majority of neo-single-bullet theorists, he acknowledges that the back wound was at the same level or lower than the throat wound, and that the bullet did not descend within the body. He even depicts this on his animated model of Kennedy. So how does he get around this? How does he have a bullet descending twenty degrees or more through the air enter Kennedy's back and exit his throat at the same level? As this bullet is, in Myers' estimation, the near-pristine CE399, it couldn't have struck bone. Furthermore, as the Zapruder film showed Kennedy's head to be upright within a tenth of a second of the moment Myers believes Kennedy was shot, Myers can't just pretend Kennedy was simply leaning forward at the moment of the shot. So how does he make it work?

Well, he distorts Kennedy's body into the body of a crone, so that Kennedy's neck is leaning forward, but not his head. This distortion can be demonstrated by comparing a photo of Kennedy in Dealey Plaza with Myer's figure of Kennedy, and by comparing Myers' figure of Connally with Myers' figure of Kennedy. (This was demonstrated on the previous slide.) The angled neck of the Kennedy figure is not apparent in any photo of Kennedy that I am aware of, nor is it seen in the Zapruder film. This Myers invention, not surprisingly, lifts the location of Kennedy's back wound considerably above his throat wound, and makes it appear possible for a shot to hit Kennedy in the shoulder line from the sniper's nest and still come out somewhere near his throat. (Myers' exit, in fact, seems to be from the very bottom of Kennedy's throat, a half inch or more below the actual exit.)

But this was not the end of his deceptions.

Murder by Cartoon: Midget Analysis

At left: Zapruder frame 226

At right and below: Dale Myers' animation taken from the Discovery Channel program JFK: Beyond The Magic Bullet.

To Dal-Tex?

Black line represents trajectory if Connally sized to match Kennedy.

Red bars added to demonstrate relative sizes of Kennedy and Connally.

Below: photograph showing the actual size of the two men.

Murder by Cartoon: Midget Analysis

As Dale Myers' animation depicts Kennedy stooped forward at the moment of the magic bullet's impact, in the approximate posture of an old crone, one would think an overhead shot of this pivotal moment would show his head out in front of his body. But once again, Myers' animation fails the consistency test. The overhead view of Kennedy in 2004's *Beyond the Magic Bullet* shows him to be sitting straight up, with his head barely forward of his back. What me, consistency?

When one looks closer at this overhead view, the integrity of Myers' work is once again called into question. When viewed from above his characters seem to have entirely different proportions than the real Kennedy and Connally. Clearly, Myers uses different measurements for his animated figures depending on how he wants them to be seen. How else can he explain the fact that Connally, who was 6'2" 205 lb.s to Kennedy's 6'0" 170 lb.s, is depicted as a much smaller man than Kennedy? It certainly appears to be more than a coincidence that by depicting Connally as a midget Myers was able to place Connally's armpit, the site of the bullet entry, several inches further in from the side of the car, and more in line with the pre-determined trajectory from the sniper's nest through JFK.

While Myers has done some valuable research, particularly when it comes to the head wound trajectories and the Tippit shooting, his deception regarding the single-bullet theory is simply inexcusable. He would have to know that when people see computer simulations they believe the proportions are consistent from angle to angle—otherwise it's just a cartoon. By changing the body

shape of Kennedy to accommodate the bullet trajectory through his body, and by shrinking Connally 20% or more to accommodate the bullet trajectory in the car, Myers moved on up to the high rent neighborhood of Thomas Canning: deliberate deceptionville.

His depiction of Kennedy's position in the car is also in error. While the Zapruder film shows Kennedy's arms inside the car, as there's no shadow on the side of the car, Myers' animation always depicts Kennedy's right elbow hanging over the side, a position Kennedy had abandoned seconds before. Not surprisingly, this misrepresentation by Myers puts Kennedy more in line with the pre-determined sniper's nest—JFK--Connally trajectory.

In sum, while it may have been created to accurately depict a murder, the only murder accurately depicted in Myers' cartoon is the murder of the truth.

(NOTE: so that no one stopping here is deceived. As we progress in this chapter, I include a number of responses by Myers, in which he offers explanations for the diminutive Connally. He eventually offers one that makes sense (well, sorta). He admits the images used in *Beyond the Magic Bullet* were distorted, but insists this was done inadvertently. He insists as well that this has no bearing on the feasibility of the single-bullet theory. Read on and decide for yourself.)

Murder by Cartoon: Birth of the Midget

On his website, Dale Myers acknowledges the bullet at Z-224 came into the car at a 10 degree angle. But does his animation accurately portray this angle?

Above: Dale Myers' animation in 1998's *Live By the Sword*. Below: his animation in 2004.

Gold star represents the bullet entrance if Connally was the correct size. Added line is at a 10 degree angle to the car. Myers' line is at a 6 degree angle.

Above: Warren Commission Exhibit CE 883, a surveyor's plat of Dealey Plaza. Blue line depicts the view of Zapruder along the edge of the Stemmons Freeway sign. This establishes Kennedy's position at Z-224. Gold line reflects the center-line of the limousine at Z-224. Red line reflects the 10 degree angle from the sniper's nest. Insert: HSCA Figure II-19, with the 10 degree angle from the sniper's nest added.

Murder by Cartoon: Birth of the Midget

In June 2006, while looking through a website devoted to debunking the film JFK, I noticed yet another inaccuracy in Myers' animation. In a section of the website devoted to proving that Oliver Stone was a liar was an early Myers depiction defending the single bullet theory that grossly misrepresented the single bullet theory. This same depiction was featured in Gus Russo's 1998 book, *Live by the Sword*, a book devoted to the "Oswald-did-it" theory. Precursing ABC News and the Discovery Channel by a full 5 years, Russo grossly overstated the value of Myers' work, and grossly oversold its accuracy. The caption to Russo's depiction reads: "when the car blueprints, body sizes, surveyor's maps, and exact measurements are considered, it is clear that Connally's wounds track back through JFK to Lee Harvey Oswald's perch in the Book Depository, as the Myers computer renderings clearly demonstrate." When one looks closely at this Myers "computer rendering," however, two inaccuracies are abundantly clear: 1) the bullet goes from Kennedy to Connally in a straight line within the car; and 2) the car is driving directly away from the school book depository! Well, a close look at the surveyor's plat of Dealey Plaza that Myers is purported to have studied will show you that this did not happen. Elm Street has not curved that far to the left by frame 223, when Myers claims the shot was fired. Consequently, I decided to see if Myers had corrected this mistake on his website. Sure enough, when discussing his analysis of the limousine's location at frame 223 of the Zapruder film, Myers confirms "The result shows the bullet moving at a 10 degree angle, right to left, relative to the middle of the limousine."

When I double-checked Myers' words against the overhead view he created in 2004 for the Discovery Channel, however, I found out his words were rather hollow. On the overhead view, already deceptive due to its "shrinking" of Connally and the resultant moving of his armpit closer to the middle of the car, the right to left angle within the car was but 6 degrees! I also noticed at this time that the car itself was angled 2 degrees in the overhead view, creating the appearance that the bullet trajectory was coming in at 8 degrees. It seemed obvious from this that Myers, aware that his early depictions were incorrect, tried to straighten the car up on Elm Street, so that a bullet heading into the car at a 10 degree angle would hit Connally in the armpit. Apparently unwilling to simply slide Connally over in his seat, ala the HSCA trajectory analysis, Myers instead began to tweak things a little. First, he down-sized Connally to move his armpit in a little. Then, he minimized the angle of the bullet coming into the car so that the bullet could strike paydirt in Connally's newly pint-sized armpit.

If I'm reading too much into this, I apologize to Mr. Myers. It's certainly possible I am mistaken or that his mistakes were honest mistakes. But take a look for yourself and see what you think. It seems obvious to me that an honest depiction of Connally's size, when coupled with an honest projection from the wound in his armpit back through Kennedy's wounds, would point back to the Dal-Tex Building, and not the sniper's nest. Based upon the behavior of Arlen Specter, the Warren Commission, and the HSCA, it seems that this thought is unthinkable. If Myers has been deliberately deceptive on this issue, he's but one of the latest in a long line of deceivers, many of whom have been honored and rewarded for their deceptions..

As we've seen, the Discovery Channel built an entire program around such deceptions.

The Defense of Dale Myers

(In February, 2008, I discovered that Myers has indirectly responded to a number of my criticisms. On his website, he asks himself a question, and then responds by discussing how such awful questions get asked in the first place. In the interest of fair play, I include his response. In the interest of what I perceive to be the truth, I include my response to his response.)

Myers responds by asking: "Isn't it true that you admitted a key flaw in your recreation: the incorrect positioning of the president's back wound?"

Myers answers: *"No. One critic has repeatedly made this false claim on number of Internet newsgroups. The charge stems from a preliminary 1995 version of my computer recreation which employed generic humanoid figures to represent Kennedy and Connally and determine the locations of their bullet wounds. When a trajectory line was connected from the entrance wound at the back of Connally's right armpit with the exit wound on the front of Kennedy's throat, and projected rearward, that line passed a bit high of the presumed location of the entrance wound on Kennedy's upper-right back. I explained that the generic nature of the humanoid figures, which were not exact matches of either man's physique, was probably responsible for this visual effect. I also pointed out that because the medical evidence shows that Kennedy had only one bullet wound in his upper-right back, and the projected trajectory nearly intersected that exact location, there could be little doubt that the discrepancy was attributable to slight inaccuracies in the generic models.*

In the recreation broadcast on ABC Television in the fall of 2003, I used new human skeleton models to more accurately pinpoint the wound locations in both men and also used new high resolution human models, though still generic in physique, to "skin" the underlying skeletons. Both of these model upgrades resulted in more accurate wound placement and improved trajectory analysis which effectively demonstrated that the earlier inaccuracies were in fact due to the generic models, as I surmised."

My response: nonsense. As demonstrated by his depiction of the back wound location, included on the Birth of the Crone slide above, Myers has clearly moved the back wound well above the back wound shown in the autopsy photos and measured by the HSCA Forensic Pathology Panel. His assertion that his cartoon characters are based on high resolution human models, and that this improvement in technology led to his discovery that the actual wound was where he assumed it to be to begin with is garbage of the smelliest kind. While he is telling the truth when he notes that he attributed the discrepancy in his earlier work to "slight inaccuracies in the generic models," he is not telling the whole truth. As of 9-20-2003, his website claimed "The minimal discrepancies between the renderings and the photographs are anticipated in a model of this type and are due to (a) the use of generic humanoid models that do not necessarily match the muscular physique of the victims, and (b) the potential errors (up to 2 degrees at Z223) inherent in positioning computer models based on the Zapruder film." It's not at all funny how Myers now forgets his acknowledgment of an "up to 2 degree error" in his positioning, and blames the earlier discrepancy entirely on those darned generic 1995-era humanoid models.

Myers responds by asking: "Isn't it true that you distorted the size and position of your models of President Kennedy and Governor Connally in order to fit your simulation to the single bullet theory?"

Myers answers: *"No. One critic charged that "Myers depicts Governor Connally's body as considerably smaller than JFK's body" - 25% according to one of this critic's measurements, and later 15% smaller, after a second measurement - and that "by depicting Connally as a midget it allowed Myers to place Connally's armpit, site of the bullet entry, at a point several inches further in from the side of the car, and more in line with the predetermined trajectory from the sniper's nest through JFK." According to this critic I also distorted Kennedy's size and position, writing "In order to make the trajectory work, however, Myers had to distort Kennedy's body shape. Kennedy suddenly had a crookneck, which curves forward and then up, like the neck of an old crone. This is not apparent in any photo of Kennedy. This Myers invention made it possible for a shot to hit Kennedy in the shoulder line and still come out his throat. When viewed from above, however, this distortion should have been obvious, with Kennedy's head a half-foot forward of his shoulder. In the Discovery Channel program Beyond the Magic Bullet Myers' animation was shown both from behind and above, and the two depictions of Kennedy's shoulders and his back wound were completely at odds with one another. Clearly, Myers uses different measurements for his animated figures depending on how he wants them*

to be seen."

The critic also charged that "While the Zapruder film shows Kennedy's arms inside the car, as there's no shadow on the side of the car, Myers' animation always depicts Kennedy's right elbow hanging over the side...Not surprising, this misrepresentation by Myers puts Kennedy more in line with the pre-determined [single bullet theory]. When JFK is put in his proper position the trajectory traces back to the Dal-Tex Building."

What does the critic conclude from all of this? "While Myers has done some valuable research...this deception regarding the single-bullet theory is inexcusable...He lures you into thinking that because he's using a computer the proportions and angles are the same from frame to frame and shot to shot when they're not...I've come across three different depictions by [Myers] of the single-bullet shot which move the President's position and the wound itself depending on what would look plausible to the viewer from that angle...It's all smoke and mirrors...[H]is animation is blatantly dishonest and demonstrably inaccurate...The bottom line: it's okay to misrepresent the evidence as long as you do it to PROTECT the government."

Hogwash. This is a common refrain from critics of my computer work. The truth, of course, is that my computer reconstruction of the Kennedy assassination is based on a single model put in motion. The mistakes this particular critic made in his analysis of my work are numerous.

First, his claim that the relative sizes of Kennedy and Connally change according to the angle at which they are presented is apparently based on the critic's measurement of the final rendered image. Performing an analysis in this manner fails to take into account photogrammetric effects as well as the size distortions produced by the computer's virtual camera. Photogrammetry describes how three-dimensional spatial relationships can be extracted from two-dimensional photographs or images. Without taking into account these relationships, accurate interpretations of two-dimensional images are impossible. In short, you cannot simply draw or overlay lines on a two-dimensional image (as this theorist has claimed) and extract three-dimensional measurements. This is a common amateur blunder. In addition, each rendered viewpoint is generated by a virtual camera whose focal length characteristics are akin to real-world cameras. For instance, a wide angle focal length in both virtual and real-world cameras will produce images in which identical-sized objects appear at different sizes depending on their relationship to the camera. In the case of my computer reconstruction, wide angle overhead-view renderings of Kennedy and Connally in the limousine will produce images in which the model of Kennedy appears slightly larger than the model of Connally if the virtual camera is positioned closer to the Kennedy model. Clearly, this was the case in the rendered images used by this critic for his "analysis".

Second, the critic's claim that I distorted Kennedy's neck in order to produce a position favorable to the single bullet theory is equally invalid. The computer model of Kennedy was matched to the position dictated by the Zapruder film - the only complete filmed record of the event. This filmed record records the three-dimensional position of Kennedy's head, neck, shoulders, upper torso, arms and hands relative to his surroundings. The computer reconstruction tracks the dimensional changes of Kennedy's body as recorded by Zapruder's camera. Those positional changes are not "inventions" created by me in order to validate the single bullet theory. Rather, the Zapruder film, and consequently my computer reconstruction based upon it, are a definitive record of what actually occurred in Dealey Plaza.

Third, the critic's charge that my computer reconstruction falsely depicts Kennedy's right elbow hanging over the right side of the car, while the Zapruder film shows Kennedy's arm inside the car, and that this "misrepresentation" puts Kennedy more in line with the single bullet theory is also invalid.

The critic apparently bases his claim on the fact that the Zapruder film doesn't show Kennedy's arm casting a shadow on the car. The critic fails to consider whether a shadow from Kennedy's arm would even be visible on the limousine's surface given the quality of the film and the highly reflective nature of the limousine body. More importantly, despite the critic's claim, the position of Kennedy's torso, as determined by the shoulder-line, and the length of his upper arm, make it a certainty that Kennedy's right arm would have extended over the side of the limousine. In fact, numerous photographs of the Kennedy motorcade show this to be true. Incidentally, the critic never offers any facts to support his claim that positioning Kennedy properly in the limousine would result in a trajectory that traced back to the Dal-Tex building.

Finally, the overall charge that I re-positioned Kennedy and Connally and the location of their wounds from rendered sequence-to-sequence in order to validate the single bullet theory and/or hide the truth about their actual positions during the shooting is completely false and without foundation. I find it quite entertaining that critics of my computer work are perfectly comfortable embracing the portions of my work that support their own theories (this particular critic agrees with my reconstruction of the trajectory of the fatal head shot), while rejecting those portions they disagree with. Evidently, it's okay to use the work of a "blatantly dishonest" individual as long as you can pick and choose your own truth."

My My My My-rebuttal: I'm sorry. I didn't mean to hurt his feelings by agreeing with him some of the time. I'll be sure and disagree with him on everything in the future. No, seriously, he makes a valid point in that it's best to criticize the integrity of someone's work without passing judgment on their character. It's just hard for me to do so under these circumstances, when his depiction of the single-bullet theory is so incredibly misleading. As for his assertion that I "use" his work, he should get over himself. When his findings correspond with my own, I pass this information on to the reader, so that the reader can better judge what is evident to researchers on both sides of the fence. I fail to see how this amounts to my "using" his work. If the reader disagrees, please let me know.

As for his explanation on why Connally appears to be under-sized, it leaves a lot to be desired--chiefly, the truth. By stating that Connally only appeared to be a midget due to blah blah blah photogrammetry blah blah blah, he is as much as admitting that his overhead depiction of the left-right trajectory between Kennedy and Connally was deceptive. Did he forget that I didn't cherry-pick an image from his animation, and claim he used this image to say Kennedy and Connally were in alignment, but instead analyzed the image HE chose to "demonstrate" the alignment between Kennedy and Connally? And why, if as he states, *"you cannot simply draw or overlay lines on a two-dimensional image (as this theorist has claimed) and extract three-dimensional measurements. This is a common amateur blunder"* did he use a three-dimensional image to demonstrate the bullet trajectory? I mean, why not just use a schematic, free of distortion? He was using a computer. How hard could it have been? And is it really possible that he fails to realize that by asserting his image was distorted by his use of a wide-angle "virtual" camera, he was as much as admitting that his demonstration was a charade? And does he really expect us to believe that his use of a "virtual" camera would distort the size of Connally's head, less than 2 inches below Kennedy's head, but not Kennedy's feet, several feet below? I mean, why are Kennedy's feet not only proportional to his head but so much larger than Connally's, when they're on the same floor as Connally's feet, and are the same distance from this ultra-high-tech "virtual" camera? Methinks he's blowing smoke.

The uncomfortable feeling of having smoke blown in my direction, led me to take an even closer look at the smoke-blower. And I didn't like what I saw.

Shadows and a Doubt

Images from *Beyond the Magic Bullet*, at left, and *Beyond Conspiracy*, at right, demonstrate Myers' use of shadow to suggest Kennedy's right arm was above the side of the limousine.

But was it? Myers image at far left, from *Beyond the Magic Bullet*, shows shadow on the side of the limousine at a point where Myers acknowledges no shadows can be seen in the Zapruder film (as seen at left).

Shadows and a Doubt

When I looked back at Myers' animation, I found he was right about a few things. First, he was right about the shadows I thought should be apparent on the side of the limousine should Kennedy's arm be extended over the side of the limousine. Myers stated "*The critic fails to consider whether a shadow from Kennedy's arm would even be visible on the limousine's surface given the quality of the film and the highly reflective nature of the limousine body.*" What Myers failed to understand, however, is that it was his animation that made me believe the shadows should be apparent in the first place. That's right, Myers' animation invariably depicts the shadow of Kennedy's arm on the side of the limousine. Since Myers, by his response, now acknowledges that he didn't see these shadows, one can't help but wonder why he decided to include them in his animation. As many objects in the films are not depicted in Myers' animation (including Jacqueline Kennedy), one can't help but wonder why Myers decided to include something he admits he could not see.

Hmmm...could it be that the depiction of shadows corresponding to Kennedy's right arm on the side of the limousine helped sell that Kennedy was hanging over the side of the limousine?

Have a Cigar!

At left: Warren Commission Exhibit CE 895, showing the view from the sniper's nest at Z-225. At right: Myers' near-lateral depiction of the single-bullet theory, about 1/10th of a second before Z-225. Why are the crosshairs at left below the impact on Connally at right?

Above: a lateral view of the single-bullet theory, with a full-sized Connally at right. Does the bullet exit Kennedy's throat, or chest?

Images above and at left from Beyond the Magic Bullet. (Red lines added on the lateral view.)

Why did the identical bullet trajectory lead to Connally's armpit in the animation, but the middle of his back in the tests?

Have a Cigar!

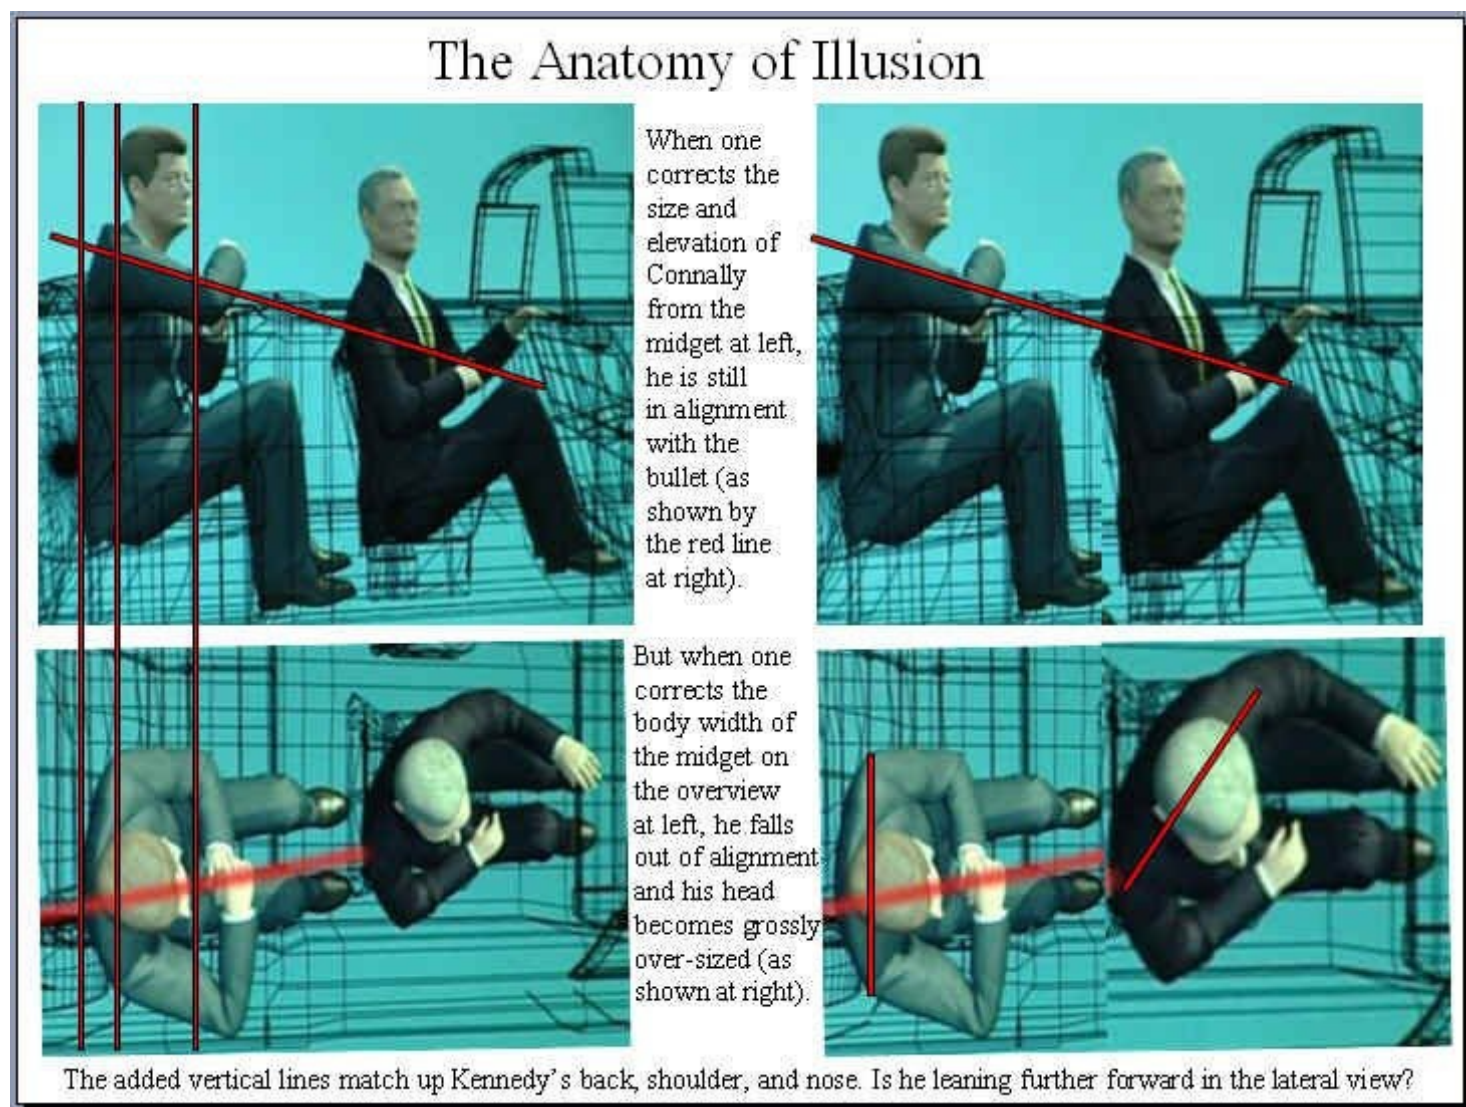

Myers is correct on another point as well. In earlier versions of this webpage, when I discussed the overhead "midget" view, I asserted that Connally was not a midget on the lateral view, but only became one when the angle changed to looking straight down on the limousine. This was incorrect. Myers, in fact, depicts Connally as a midget on the lateral view as well.

At first, I thought his depiction of a lateral midget was designed to lift the wound from the Connally figure's back up to its armpit. The sniper's nest view at frame 225 published by the Warren Commission, and the trajectory of the bullet in Beyond the Magic Bullet, after all, demonstrated that a bullet leaving Kennedy's neck at the moment of Myers' proposed single-bullet event would go on to strike Connally's middle to lower back, and not his armpit. Ultimately, however, after correcting the size and position of the Connally model, I found that the bullet still hit Connally in the armpit.

If this is so, I wondered, why did Myers shrink his Connally model on the lateral view? If, as Myers asserts, Connally appeared to be smaller than Kennedy on the overhead view because he used a wide-angle "virtual" camera and Connally was 2-3 inches further from this lens, then why doesn't Connally appear even smaller on the lateral view, when he was six inches further from the side of the limousine than Kennedy? Did Myers "change lenses" deliberately as the cyber camera panned from the lateral shot to the overhead shot? If so, why?

The thought occurred that Myers had picked his cyber lenses and "virtual" camera locations to create the illusion of consistency, without his actually being consistent.

I asked my girlfriend, a photographer well-familiar with the effects of wide-angle lenses on an image, if it was possible that Myers had used wide angle "lenses" to create this illusion and she immediately responded in the negative. She said that a lens so distorting the size of Kennedy in comparison to Connally, when Kennedy was at best 2-3 inches closer to the lens in one view, and 6 inches closer to the lens in the other, would have grossly distorted other elements of the image as well. She disputed that such a "lens" was used in either the overhead view or lateral view and suggested instead what I'd already surmised--that Connally was deliberately down-sized in both images. (Input from other photographers welcome.)

The Anatomy of Illusion

It then occurred to me that one could lift the the bullet trajectory hitting Kennedy and Connally from the middle of Connally's back (where it impacted in the WC and Discovery re-enactments) up to Connally's armpit simply by having Kennedy lean forward off the back of his seat. A close look at Myers' animation confirmed that, yes, indeed, he has Kennedy leaning forward, with his back off the seat, at the moment of impact. As the films and photos taken just before Kennedy went behind the sign

in the Zapruder film show him leaning back in his seat, one must ask Myers at what point did Kennedy lean forwards?

While looking at Myers' depiction of Kennedy's forward lean, I once again grew suspicious that his overhead view fails to depict this lean. On the slide above, I attempt a comparison of the overhead and lateral views of the single-bullet theory presented by Myers in *Beyond the Magic Bullet*.

While performing this comparison, I decided to correct the size of Connally on the overhead view and see if this confirmed my earlier suspicions. Sure enough, I found that making Connally's shoulders full-sized brought the entrance on his back several inches further to his right than the trajectory through Kennedy. This trajectory now entered Connally squarely on his back, probably on his shoulder blade, and headed straight for his heart.

Also intriguing was that, by correcting the size of Connally's shoulders to match Kennedy's, one made his head far larger than Kennedy's. This demonstrated that the head on the Connally midget was disproportionately large in comparison to the rest of his body, but that the head on the Kennedy model was not. One can only suspect that this was done to conceal that Connally's body width had been down-sized.

At this point it occurred to me that, even though the Connally figure had been down-sized, it still appeared to fill up its seat. This meant the seat had also been shrunk. And yet Myers' animation had a series of straight lines on the floor of the limo, suggesting that all was in perfect alignment with the back seat.

Seat of Government

Above: HSCA Exhibit II-19, with the limousine used in *Beyond the Magic Bullet* super-imposed. The added red line represents the right edge of Connally's seat back on the schematic, the added pink line the inside of the door. Was Kennedy really hanging that far over the side of the limo? With not only his arm over the side, but his shoulder?

Above: Warren Commission Exhibit CE 353, a photograph of the limousine taken on the day following the assassination. The "jump seat" is 2.5 inches in from the door, as on the schematic for the limousine (by number 1 at left).

When one super-imposes Dale Myers' overview of the limousine onto the HSCA's schematic, some of Myers' improvements become clear. (2) The jump seats are smaller. (3) The Governor's seat is closer to the back seat. (4) The sides of the limo are tapered.

Seat of Government

At this point I went back to Myers' website, to see what he'd used to determine the size of Connally's seat. Myers claims "The original body draft of the modified 1961 Lincoln convertible, prepared by The Hess & Eisenhardt Company, served as a guide in modeling the presidential limousine." He later claims "The presidential limousine began as a digitized model of a 1961 Lincoln convertible. The resulting computer model was then modified to match the dimensions of the presidential limousine's original body draft, provided by Hess and Eisenhardt. Details were created based on a multitude of photographs taken during the 1963 Dallas motorcade. Particular attention was paid to the seating arrangement as depicted in photographs taken by the Secret Service and FBI in the White House garage the night of November 22, 1963."

The problem is that the HSCA printed this "body draft" as Exhibit II-19, and a close comparison of this exhibit with Myers' overhead view reveals that the actual jump seats occupied by John and Nellie Connally on 11-22-63 were approximately twice as large as the seats depicted by Myers. This supports my suspicion that Myers shrunk the seats to disguise that he'd shrunk Connally. This comparison also reveals that the Governor's seat is slightly closer to Kennedy's seat in Myers view than on the "body draft." Along with the forward lean of Kennedy depicted by Myers, this helps explain why Myers' proposed bullet trajectory through Kennedy aligns with Connally's armpit when the Warren Commission re-enactment photo of the alignment a split second later shows it aligning with his lower

back.

Equally disturbing, a close look at Exhibit II-19 reveals that Connally's seat was but 2.5 inches in from the right door. This short distance is confirmed by the Secret Service photos purportedly relied upon by Myers. In Myers' animation sequences in both *Beyond Conspiracy* and *Beyond the Magic Bullet*, the seat is shifted 6 inches inboard from directly in front of Kennedy, in order to put it into its "actual" location. While the Connally seat back in Myers' overhead view appears to be around 2 1/2 inches from the door, the seat bottom at this point is nowhere to be seen, suggesting the position of the seat back is an illusion created by Myers' use of a wide-angle "virtual" camera. Equally alarming, if the seat is really only 2 1/2 inches from the door, then Myers' Kennedy model is dangling over the side of the limousine, with not just its elbow resting on the side of the car, but its shoulder. This inspired me to take a closer look.

A Tale of 2 1/2 Inches

The Powers film, above, and Myers' own animation, at above right, suggest that JFK's backwound location was at least 5 inches inside the limo at the moment of impact. And yet, the impact on Connally on Myers' over-view, at bottom left, is only 4 inches in from the edge of a seat that is purportedly 2 1/2 inches in from the side of the door... 6 1/2 inches.

When we project 10 degrees back from this impact location, as at bottom right, it becomes clear the impact on Kennedy would occur about 1 1/4 inches inside the door. This suggests that Connally's seat at left is really more than 2 1/2 inches in from the door.

A Tale of 2 1/2 Inches

Since Myers depicts the impact location on Connally about 20% across the width of his seat, and since Myers claims the seat is 20.5 inches wide, it seems fair to assume the bullet strikes 4 inches in from the edge of his seat on Myers' animation. Since Myers claims this seat was 2 1/2 inches in from the right door, moreover, we can venture, should Myers be telling the truth about this seat being 2 1/2 inches

from the door, that he believes the bullet impacted 6 1/2 inches in from the door.

I decided to put this to a test, and see if Myers could possibly have believed this. I decided to project back 29.36 inches (74 cm...the HSCA's 14 cm distance through Kennedy's back/neck plus the HSCA's 60 cm distance from Kennedy's throat to Connally's back) at 10 degrees (Myers' accepted horizontal angle of trajectory from the sniper's nest to the limo at Z-224) from 6 1/2 inches from the door, and see where this would impact on Kennedy. While the Dave Powers film of Kennedy in the motorcade suggests the impact on Kennedy was 8-10 inches in from the side of the limo, and Myers' own animation suggests the impact on Kennedy's back was about 5 1/2 inches (the distance from his shoulder tip to the back wound) in from the side of the limousine (which would make it about 4 3/4 inches in from the side of the door, which appears to be about 3/4 of an inch inboard from the right side of the back seat on the schematic), the impact on Kennedy would have to have been about 1 1/4 inches in from the side of the door, if Connally's seat was really 2 1/2 inches in from the door. This meant that Myers had placed Connally's seat around 3 1/2 inches too far inboard, and confirmed for me that he'd placed it 6 inches in from the door, and not 2 1/2, as on the schematic.

So how does Myers explain this mistake?

If 6 Were 2 1/2

Presto Chango! In Beyond the Magic Bullet, Myers slides his Connally model inboard six inches to reflect his "actual" position (as shown in the images above). He now insists that Connally's seat "was correctly located 2.5 inches in from the inside of the right hand door" in the second image. If so, the seat in his first image was 3.5 inches OUTSIDE the inside of the door. Does that make any sense? (The added red lines demonstrate the location of the right edge of Connally's seat in each image, and thus the distance of the inwards shift.)

Image at right is a depiction of a full-sized Connally, sitting on a seat 2 1/2 inches to the right of the door, with a bullet exiting Kennedy's throat on a true 10 degree R-L trajectory. (This is, in other words, an overhead view after Myers' "mistakes" have been corrected.) The bullet doesn't hit Connally in the armpit.

If 6 Were 2 1/2

On his website, Dale Myers asks: "Isn't it true that you incorrectly modeled the presidential limousine, positioning Connally's jump seat six inches from the inside of the door rather than the actual distance of 2.5 inches?"

Myers answers: *"No. One critic claimed that I "used the incorrect limo measurement of a 6 inches clearance between JBC jump seat and door. The actual measurement was 2.5 inches. So whatever trajectory [Myers] thought he proved was not what 'a single bullet' could have taken."*

"This particular criticism stems from a comment made during the ABC News broadcast. At one point in the program, a computer animated sequence compares a diagram of how conspiracy theorists believe Kennedy and Connally were seated in the limousine with how they actually were seated as seen in the Zapruder film. Peter Jennings notes in voiceover narration that Connally was not seated directly in front of Kennedy, as some conspiracy theorists believe, but was "six inches" to Kennedy's left. However, the six inch figure mentioned in narration did not refer to the distance between the jump seat and the inside of the limousine door, as presumed by this critic, but instead referred to the distance between the center of Kennedy and Connally's body. Kennedy was seated to the extreme right side of the limousine. Connally was turned to his right and had shifted left on the jump seat in front of Kennedy. Projecting an imaginary line forward from the center of the both men shows that the difference between their two center points is six inches. Connally's jump seat, which was about 20.5 inches wide, was correctly located 2.5 inches from the inside of the right-hand door."

Godzilla! I'd accepted the possibility that Myers felt his animation was "close enough" and had, step by step, made it more and more convincing, without his fully realizing that it was now yards if not miles away from an accurate depiction of the shooting. But I hadn't fully expected him to LIE in such a manner. I figured he would say that he'd mistakenly trusted the Warren Commission testimony of Secret Service Inspector Thomas Kelley, but that this mistake was of no importance.

After all, on June 4, 1964, during the sworn testimony of Thomas Kelley (5H129-134, the same Arlen Specter-orchestrated testimony in which Kelley falsely stated that CE 386 was used to mark the back wound during the re-enactment), the following exchange took place:

Mr. SPECTER. On the President's car itself, what is the distance on the right edge of the right jump seat, that is to say from the right edge of the right jump seat to the door on the right side?

Mr. KELLEY: There is 6 inches of clearance between the jump seat and the door.

When blaming his mistake on Kelley, moreover, Myers could also have pointed to the 1979 HSCA trajectory report, in which Thomas Canning claimed : "Connally, on the other hand, was seated well within the car on the jump seat ahead of Kennedy; a gap of slightly less than 15 centimeters separated this seat from the car door." (As Canning was a NASA scientist, and meticulous in the presentation of his findings, his representation of a gap of 2.5 inches (roughly 5 cm) as only "slightly less" than 15 cm (roughly 6 inches) is thoroughly out-of-character and suggestive that he, or the committee itself, was trying to hide that Kelley had testified incorrectly to the Warren Commission.)

But no, Myers never even mentions these deceptive assertions in his response. Apparently, we're to believe it's just a coincidence that Kelley falsely testified that the seat was six inches in from the door, Canning helped cover up that Kelley falsely testified, and that Myers' animation just so happened to shift Connally's seat inboard 6 inches to its "actual" location.

Even more troublesome is Myers' own deceptive assertion that he bears no responsibility for the inaccurate perception that he placed the seat six inches from the door. No, he claims, it stems not from anything he'd said or done but from a misinterpreted voice-over by the now-deceased Peter Jennings on

2003's Beyond Conspiracy.

Nothing could be further from the truth. When discussing Oliver Stone's movie JFK, Jennings says: "In the Stone film diagrams have Governor Connally sitting directly in front of the President, facing forward at the time of the second shot. Not true. Governor Connally was sitting 6 inches inboard of the President, and turned sharply to his right." (During this pronouncement we see an animated Governor Connally sitting in front of an animated President, then slid inboard, and turned to his right.) Now compare this to Myers' exact words from Beyond the Magic Bullet, a year later. (Note: he's looking at the overhead view on the slide above): "Here's the position that most critics believed they were occupied at the time of the single bullet, with Connally directly in front of Kennedy. But that's not true. Actually, Connally's seated about six inches inboards (Here, he slides Connally over, as depicted on the second image in the slide up above). And turned to his right."

It is therefore Myers who is responsible for the mis-perception that his animated jump seat was six inches inboard of the door, and not Jennings!

Even worse, and as already discussed, it is not actually a mis-perception! When one compares the edge of the jump seat in Myers' overhead views of the seat before and after he slides it inwards, it's absolutely and devastatingly clear that he slides the SEAT inwards six inches in both Beyond Conspiracy and Beyond the Magic Bullet. He does not slide the middle of Connally's body over six inches on the seat. He slides the seat. Unless one is to believe that Connally's seat, in Myers' first image, is actually 3 1/2 inches outside the interior of the limousine, it is strikingly clear that Myers moves the seat 6 inches in from the door, and not 2 1/2. This fabrication by Myers--blaming his own deception on a dead man--in my opinion, marks a new low and reveals the depths that he will travel before he will admit the obvious--that his animation deceptively depicts an under-sized Connally model on a seat 3.5 inches further from the door than the seat occupied by the flesh and bone Connally, and that, when these mistakes are corrected, the bullet exiting Kennedy's neck strikes Connally in the middle of his back.

In Myers' defense (I can't believe I'm doing this) it's clear he's in a trap. He can't admit his "mistake" without risking all he's worked for. He sold his animation to large entertainment corporations under the assurance it was accurate. He then snowballed this success to become a semi-visible ghost writer for Vincent Bugliosi's Reclaiming History. In the acknowledgments section, in fact, Bugliosi writes "no one helped me as much as Dale Myers, the Emmy Award-winning computer animation specialist...Dale helped me in the writing of several sections of Book One." Included in Book One is Bugliosi's section on the single-bullet theory. Not surprisingly, he (or Myers) condemns conspiracy theorists for assuming that Connally was sitting directly in front of Kennedy by writing "In fact, Connally's jump seat not only *was situated a half foot inside* and to the left of the right door, but also was three inches lower than the backseat." This assertion has a footnote. As one might guess, it refers back to the inaccurate testimony of Thomas Kelley on June 4, 1964.

Such a mistake would be bad enough, but Bugliosi ended up compounding this mistake during the 2007 promotional tour for his book. In appearance after appearance, from a video interview put online in April 2007 through the many interviews that followed, Bugliosi accused conspiracy theorists of telling an "unbelievable lie" when they depicted Connally sitting directly in front of Kennedy on drawings designed to discredit the single-bullet theory, and then told his audience, over and over, the all-too believable lie that Connally was actually "seated on a jump seat 6 inches in from the door."

By 8-20-07, Bugliosi was still engaging in this embarrassing regurgitation of misinformation. On that day, he echoed his earlier statements and told George Mason University's History News Network:

"If you start with an erroneous premise, everything that follows makes a heck of a lot of sense. The only problem is that it is wrong. There's no question that Connally was not seated directly in front of

*Kennedy in the presidential limousine. He was seated to his left front. I have a photograph in Reclaiming History showing exactly where they were seated, and right along side of it I show sketches that they put in conspiracy books, [with Connally] right in front and the bullet is making a right turn and a left turn. But he was seated to [JFK's] left front **in a jump seat a half-foot in** so the orientation of Connally's body vis a vis Kennedy's was such that a bullet passing on a straight line, through Kennedy, would have no where else to go, except to hit Governor Connally."*

Should we tell Bugliosi that his defense of the single-bullet theory was in large part based on the "erroneous premise" that the jump seat was 6 inches inboard of the door? Or should we assume that Myers, who, after all, was on Bugliosi's payroll, has already set him straight?

Bugliosi Vs. Myers

A comparison of Myers' Beyond Conspiracy overview, at left and above, with the single-bullet trajectory in Vincent Bugliosi's Reclaiming History, at left, demonstrates that at least SOMEONE working with Bugliosi knew the jump seat was 2 ½ inches from the door. The red lines illustrate the bullet trajectory. The pink lines illustrate the distance between the two jump seats. The dark blue lines illustrate the inside of the door. The green lines illustrate 2.5 inches in from this door. Note how much further inboard Myers places the seat than Bugliosi's illustrator. Note also how both animators have JFK's right shoulder draped over the side of the limo, when, as shown above, photos of the motorcade show it to have been well inside the limo.

Bugliosi Vs. Myers

Maybe someone has already told Bugliosi that the seat was only 2 1/2 inches from the door, but he forgot. When looking back through his book, in order to learn more about his connection to Myers, I came across yet another depiction of the single-bullet theory, this one courtesy Animation of Arizona. This depiction differed both from his semi-visible ghost-writer and "Emmy Award-winning computer animation specialist" Dale Myers' animation, and the text of Bugliosi's book, in that it presented the jump seat in its proper location, 2 1/2 inches from the door.

It differed in other ways as well. While the first part of Bugliosi's book describes a 4.9 second gap between the second and third shots, roughly 90 frames, and this indicates the second shot came around frame 223, 90 frames before the head shot at frame 313, the illustration section declares: "No one knows the exact Zapruder frame at which the president and Governor Connally were hit by Oswald's second bullet, but it was somewhere within a split second of frame 210. This is a three-dimensional overhead rendering of Kennedy and Connally as they were seated in the limousine at approximately frame 210, with the single-bullet's trajectory." This image, as demonstrated on the slide above, depicts Kennedy hanging over the side of the limo. This, in my opinion, is totally inconsistent with the motorcade photos depicting Kennedy's position in the limo. These show his elbow to be resting on the side of the limo but his shoulder to be well inside. And it's not just my opinion that Kennedy jerked to the left by 210. Let's recall that the HSCA photographic panel concluded:

70) At approximately Zapruder frame 200 , Kennedy's movements suddenly freeze; his right hand abruptly stops in the midst of a waving motion and his head moves rapidly from right to his left in the direction of his wife. Based on these movements, it appears that by the time the President goes behind the sign at frame 207 he is evidencing some kind of reaction to a severe external stimulus.

So where does Bugliosi get off pretending that Kennedy's draped over the side of the limo at 210? First, Kennedy's behind the sign and no one can tell exactly where he is, and second, when last seen his head was moving from right to left. There's absolutely no reason to believe he's in the position depicted.

Which brings me to a related point. In Dale Myers' TV appearances, and on his website, he preaches the gospel of Connally reacting to a shot at frame Z-224. (I pretty much agree.) He even claims Kennedy and Connally were in a position to receive their wounds for but a split second, between frames 217 to 224. So how could he have sat by while Bugliosi dismissed or ignored his evidence for this hit, and pretended instead that the shot could have come as early as frame 210? It must have been extremely frustrating for him.

Something tells me it was. In the acknowledgments section of Reclaiming History, where Bugliosi lavishes praise upon Myers and thanks him for all his help, he writes "*Even though he worked with me for a relatively short part of my long journey, no one helped me as much as Dale Myers.*" David Lifton, whom Bugliosi praises in Reclaiming History for his thorough research, while at the same time criticizing him for his unorthodox conclusions, decided to do some digging on this previously secret Bugliosi/Myers connection.

On March 11 2008, on historian John Simkin's Education Forum, Lifton reported:

With the 1998 ARRB releases, and the advent of the Internet, Bugliosi needed assistance to complete his project. This brings us to the second phase.

ENTER Ghostwriter #2 –DALE MYERS

Bugliosi (and/or his publisher) hired another writer--this time, one with expertise in the area of the shots, the medical evidence, and the acoustics. Dale Myers—the JFK researcher who appeared with Bugliosi on a Discovery Channel documentary—was solicited, and agreed. Once again, as was the case with Haines, a formal contract was drawn up. Furthermore, it was agreed that the credit for the book would now read "by Vincent Bugliosi," but "with Dale Myers."

Unfortunately for Bugliosi (and perhaps because both of these fellows have outsized egos), the collaboration between Dale Myers and Bugliosi didn't work out. Consequently, and similar to a marriage that doesn't work, a "literary divorce" now had to be arranged (i.e., another contract had to be drawn up—this one spelling out the terms of their "separation.") One of the provisions of this second

contract was that Myers agreed that he would never divulge the existence of the original arrangement, or its dissolution. In other words, Myers is bound by contract not to talk about the writing he did for Bugliosi, what he contributed, how much he was paid for his contribution, or the circumstances of their "divorce."

Consequently, Dale Myers has TWO contracts with publisher W. W. Norton:

--the first, when his writing deal was originally formalized, and the book was to be published with the authorial credit reading by Vincent Bugliosi "with Dale Myers";

-- the second, when their collaboration didn't work as planned and their separation had to be formalized.

So now, addressing the issue of ghostwriting and counting up the signed contracts for ghostwriting, here's where we stand: there's one (and probably two) with Fred Haines (one for the original arrangement, and one for the separation); similarly, there were two contracts with Dale Myers—one for the original arrangement, the second for the "literary divorce."

Since single-assassin theorists routinely criticize conspiracy theorists for 1) trying to make money off the assassination, and 2) not having a uniform theory, it's more than a little ironic that Bugliosi and Myers, possibly the two highest-profile single-assassin theorists of recent times, couldn't see eye to eye and develop a uniform theory, and had to get Bugliosi's publisher to pay Myers off.

Modeling 101

Above: a comparison of the single-bullet theory over-view on Beyond the Magic Bullet (blue) with the limousine model on Myers' own website (gray). The jump seats on Beyond the Magic Bullet are under-sized, and Connally is further inboard on the program than he would have been had Myers used his original model. A comparison of the jump seat on HSCA Exhibit II-19 (white) and Myers's model is at bottom right, revealing that his original model was reasonably accurate.

Modeling 101

When I looked back at Myers' website, to see what else I'd missed, I noticed that he illustrated his schpiel about the construction of his limousine model, quoted back in the Seat of Government section, with an early version of his limousine model. When I compared this early version of his model with the completed model used in Beyond the Magic Bullet, it confirmed once again that he had shrunk Connally's seat for his single-bullet theory depiction. When I compared this early model to the schematic purportedly used in its creation, however, it held a few surprises. Surprise number 1 was that the schematic was not drawn to scale, as the space between the seat and the door purported to be 2.5 inches, was much larger than that when compared to the seat, which was purportedly 20.5 inches wide. (The measurements are considered to be definitive, and not the schematic itself.) Surprise number 2 was that, even though Myers depicts the seat on this model too far from the door, he depicts the door thinner than on the model. This puts the seat at almost the exact same spot, relative to the outside of the limo, as on the schematic. (As the 2.5 inch distance from the door on the schematic is inaccurately depicted as only slightly more than 2.5 inches, relative to the size of the seat, Myers' seat is probably within an inch of the seat's actual location.)

This brings up the question: if Myers' early limousine model depicted the seat (almost) in the right place, why'd he move it for his finished animation? Well, when one puts Beyond the Magic Bullet's

Connally model on the jump seat of Myers' early limo model (as on the slide above), one can see the probable answer. The bullet hits Connally in the back, and not his armpit. While this was already demonstrated on The Anatomy of Illusion slide, it has to be considered more than significant that Myers' early models demonstrate that this is true, and not just my correction of his finished model. It's hard not to conclude from this that Myers deliberately fudged his animation to portray what he knew to be untrue.

(NOTE: so that no one stopping here is deceived. As we progress in this chapter, I include a number of responses by Myers, in which he offers explanations for the diminutive Connally. He eventually offers one that makes sense (well, sorta). He admits the images used in Beyond the Magic Bullet were distorted, but insists this was done inadvertently. He insists as well that this has no bearing on the feasibility of the single-bullet theory. Read on and decide for yourself.)

Squeezing Out the Truth

A close look at a single-bullet theory over-view found on Myers's website (at left), confirms not only that the jump seats used in his televised over-views are deliberately under-sized, but that his trajectory originally hit Connally in the middle of his back, and not in his armpit.

At right: a comparison of the bullet trajectory from 2003's Beyond Conspiracy (at right) with 2004's Beyond the Magic Bullet (at far right). The angle changes, the side of the limo gets tapered, Connally gets closer to Kennedy, and the bullet impact moves from Connally's back to his armpit. (The matching pink lines demonstrate the distance from JFK.)

Incredibly, when one compares the grids on the limo's floor (as at bottom left), it becomes clear that the square behind Connally's seat in 2003 had become a rectangle by 2004, and that Myers had compressed his image laterally to move Connally closer to Kennedy and change the impact location (as further demonstrated at right). (The matching red lines demonstrate that the width of Kennedy's shoulders had not changed.)

Squeezing Out the Truth

On this visit to Myers' website I also found a small overhead image depicting the single-bullet shot. Not surprisingly, this early depiction had a full-sized Connally sitting on a full-sized seat, and the bullet heading into the middle of his back. This gave foundation to my suspicion that Myers created his

simulation using an incorrect seat location, saw that it still didn't support the single-bullet theory, and then "fine-tuned" it by shrinking his Connally model, and tapering the side of the limo to make an 8 degree trajectory look like a 10 degree trajectory, etc.

A few days later, while watching Myers' animation on Youtube, I came to an even more surprising realization. When one compares his single-bullet theory over-views on Beyond Conspiracy, from 2003, and Beyond the Magic Bullet, from 2004, it becomes clear that it was not until the latter program that he changed the impact location from Connally's back to his armpit, and that, to do so, he had moved the bullet trajectory coming out of Kennedy's neck a few inches to its right, and compressed the overall image, bringing Connally closer to Kennedy.

Assuming that Myers "squeezed" his image to make the bullet trajectory he believes is true more palatable to the public, we should ask ourselves, at what point does making the truth more believable become an outright lie? At what point does squeezing out the truth become an exercise in deception, with no truth left to squeeze?

These questions finally squeezed some "truth" out of Myers...

Of Fast Food and Emmy Awards

Images at left and right are from JFK: Beyond the Magic Bullet. (2004)

At right: Myers' over-view from Beyond Conspiracy, with a 10 degree line drawn back from Connally's armpit. It runs to the right of Kennedy's throat wound.

Myers now contends the distortion of his animation in Beyond the Magic Bullet was caused by the camera crew's filming it at an angle (as seen above) But if that is true than the trajectory line (at top right) was a deliberate deception.

Of Fast Food and Emmy Awards

On May 1, 2008, in an email posted on a newsgroup, Myers responded to some of my criticisms. He attempted to cut off my criticism of his squeezing his image by explaining that the image in Beyond the Magic Bullet was filmed on a monitor at an angle. This took me by surprise. Before, Myers had explained that the distortion of the images was caused by photogrammetry blah blah blah but now he was saying it was the fault of the Beyond the Magic Production team. Here is his email and his explanation:

You're obviously referring to the website and rantings of Pat Speer, one of many conspiracy theorists who pretend to know the truth about my reconstruction work on the Kennedy assassination. The only thing obvious about these folks is their distain for the truth and honest research. As you noted, Mr. Speer has made no attempt to contact me and get answers about my work from the only source who could answer him - which should tell you all you need to know.

As Mr. Speer himself has noted on his website, I pointed out the fallacy of his arguments on my FAQ page. He has failed to address those fallacies and continues promoting falsehoods about my work which include the newly minted, ridiculous assertions you mentioned. For instance, he continues to claim that the Connally (JBC) figure was shrunk (as was the jumpseat) to accomodate the SBT. He now uses images of my work culled from the Discovery Channel program "Beyond the Magic Bullet" to promote this nonsense. Even a cursory look at the images should tell anyone with a brain that the images used by Mr. Speer are at an angle to the viewer (i.e, the right side of the image is falling away from the viewer). This is due to the fact that the images are being filmed directly off my computer monitor and that the camera filming these images is viewing the monitor at a considerable angle. This can be seen in any of the wide angle shots in which I am visible alongside the monitor (none of which, BTW, are included in Speer's presentation). If Mr. Speer had shown his viewers those wide angle views, it would be obvious that the reason JBC (and the jumpseat) appears smaller is because of the camera/monitor relationship.

Mr. Speer compounds this nonsense by overlaying the images from the Discovery program with those culled from the ABC/History Channel program and claiming that because they do not align I have made wholesale changes on a frame-by-frame level in order to sell a "lie" to the networks and the American public. This is obviously false.

Mr. Speer also attempts to demonstrate his theories about my work by drawing lines on two-dimensional images I have produced and pretending that these lines of "alignment" can be projected into three dimensional space. This is false, as I have already demonstrated on FAQ page when addressing equally silly accusations made by self-proclaimed photo expert Bill Miller, another conspiracy theorist who's concept of photo interpretation is equally bankrupt.

None of these self-proclaimed experts have retracted their false accusations about my work (on the contrary, they act as if their methods haven't been shown to be false and irrational), nor do I expect them to in the near future. If it isn't Mr. Speer or Miller perpetuating these myths, it would be someone else. Who has time for all this nonsense?

Mr. Speer's claims about the jump seat location have no bearing on the issue at hand - again, as I have already answered and addressed in my FAQ page. The figures of JFK and JBC were matched to the Zapruder film perspective, not to the location of the jumpseat. Frankly, you could eliminate the entire limousine from the reconstruction and the alignments of JFK and JBC would still be valid since their position in space is based on Zapruder's view of the scene and the relationship of JFK to JBC and their combined relationship to the TSBD and the surrounding buildings. In short, the position/size of the jumpseat has no bearing on the SBT. Mr. Speer might as well be arguing that the side mirror is misplaced, therefore, the reconstruction is invalid. How much sillier are all these accusations going to get?

The movements of JBC and the jumpseat (as shown in the ABC/ History Channel program and the Discovery Channel program), demonstrating the differences between prominent conspiracy-based illustrations and reality, were done in unison for clarity. Any charges to the contrary are false.

The differences in the height of the JFK and JBC were accounted for in the reconstruction. Again, any charges to the contrary are false.

The location of JBC relative to JFK (i.e. approximately 6 inches to the left of JFK's midline) and JBC's rotational position relative to the midline of the limousine (i.e. turned approximately 37 degrees to the right) as reported on my website at www.jfkfiles.com is correct. Any charges to the contrary are false.

The locations of the wounds of both JFK and JBC were marked according to medical data culled from the WC and HSCA (including photographs and X-rays) as reported on my website at www.jfkfiles.com. Any charges to the contrary are false.

Anyone who wants to pretend my reconstruction work is false or doesn't matter is free to do so. In the final analysis, the truth doesn't require anyone's belief.

I don't respond to posts on the many newsgroups because of the sophomoric nature of the vast majority of the postings (and I know many respected experts on the assassination who feel the same way). It is the insipid name-calling and disrespect for honest research that I (and others) find the most appalling. It is worse than a kindergarten sandbox. Too bad. The Internet promised to bring people of common interests together. Instead, it gives a global soap box and a megaphone to those who have the least to say.

I appreciate your thoughtful question - it is rare - and hope this answers your question.

Feel free to post my response, if you think it will help. Personally, I think you'll only see the nuts come out of the woodwork again. It's a never ending cycle of lunacy; one argument after another to see who can be the top fool.

"Best regards, Dale K. Myers" [April 2008]

Well, Dale, in the words of that old fast food commercial--have it your way. On the slide above, I've placed the "wide-angle" views of you from Beyond the Magic Bullet next to the close-ups of your animation.

That mission accomplished, I must admit I did not realize the close-up footage on Beyond the Magic Bullet was shot at an angle. I mean, why would they do that? Filming the trajectory from the side would both bring Connally closer to Kennedy and move him slightly inboard. While the interview portion with Myers was filmed at an obvious angle, I assumed this was so they could get his Emmy Award in the picture (real subtle, by the way). When they then moved in for the close-up, they cropped off the top and bottom of the screen. This made it hard to discern that one side of the monitor was taller than the other, and that the rectangular monitor was still being filmed at an angle. They also showed both Myers' left and right hands against the image. This gave the illusion the camera was over his left shoulder. As a result, there was little reason to suspect they were showing us a grossly distorted image taken from a "considerable angle".

Still, when one looks closely at Myers' hands, it's clear the camera was slightly to his left. But was this enough to grossly distort the image? I'm not sure.

What I am sure about is if, as Myers contends, the image viewed in Beyond the Magic Bullet was his original Beyond Conspiracy animation, only viewed at an angle, then someone--in the fast food lingo--sold us a Whopper.

You see, during Myers' appearance in Beyond the Magic Bullet, he glides his right hand over the image

he now admits is distorted, and a 10 degree angle follows. 10 degrees is the R-L angle from the sniper's nest into the limo at frame 223/224. On this distorted image the 10 degree angle connects Kennedy's throat wound and back wound, and hits Connally in the armpit. There is a huge problem with this. If you take this same 10 degree angle and place it on Myers' Beyond Conspiracy animation, and match it up with Connally's armpit wound, it's clear a bullet hitting Connally's armpit, as depicted on Beyond the Magic Bullet, would pass considerably to the right of Kennedy's throat wound. If you take this angle and have it exit Kennedy's throat wound, on the other hand, it hits Connally in the middle of his back.

As the angle on Beyond the Magic Bullet starts to the left of Myers' monitor, it's obvious it was added in post-production. This suggests that one of the following is true:

(a) The Beyond the Magic Bullet team added the trajectory in post-production, and it was just a coincidence that the trajectory connecting Kennedy's back wound with Connally's armpit wound, which, on an undistorted image, would have been 7 degrees, just so happened to be 10 degrees, the actual angle from the sniper's nest. (I suspect you'll agree this is doubtful.)

(b) Myers' original animation was consulted, whereby the Discovery team noted that it had the bullet entering Connally's back and proceeding into the middle of his chest. The Beyond the Magic Bullet producers then proceeded to "fix" this problem by having a properly-angled trajectory strike Connally in the armpit on an image shot from a specific angle, and distorted to their specifications.

(c) Myers himself was in on this deception, and collaborated with the producers in adding a 10 degree angle onto a distorted image in order to make his trajectory "work".

No matter what, someone sold us something that wasn't good for us.

Cutting the Crap

Above: since Myers now insists that his Connally model is exactly where Connally is in the Zapruder film, no matter where the seat was, he is not only admitting the seat in his animation is in the wrong location, but is proposing that Connally was slid way over on his seat (the blue lines), as above. When one projects the 10 degree cross-angle (the red line) he insists is the accurate angle on his animation, moreover, it projects towards the middle of the properly-placed seat, and Connally's heart.

Cutting the Crap

As part of his May 1, 2008 response to my criticisms, Myers asserted:

Mr. Speer's claims about the jump seat location have no bearing on the issue at hand - again, as I have already answered and addressed in my FAQ page. The figures of JFK and JBC were matched to the Zapruder film perspective, not to the location of the jumpseat. Frankly, you could eliminate the entire limousine from the reconstruction and the alignments of JFK and JBC would still be valid since their position in space is based on Zapruder's view of the scene and the relationship of JFK to JBC and their combined relationship to the TSBD and the surrounding buildings. In short, the position/size of the jumpseat has no bearing on the SBT. Mr. Speer might as well be arguing that the side mirror is misplaced, therefore, the reconstruction is invalid. How much sillier are all these accusations going to get?

As he was now asserting that the limousine model had nothing to do with his positioning of Connally, only measurements taken from the Zapruder film, I decided to put the seat in (as near as I could determine) the correct location on Myers' undistorted over-view, and see how it matched up with Connally. Not surprisingly, he has Connally scooted way to the left in his seat, so much that his left leg is draped off the left side of the seat.

I also put a 10 degree trajectory on this over-view to see how it all lined up. Sure enough, it hit Connally near the middle of his seat, several inches to the left of his right armpit. Sure enough, it projected into the middle of Connally's chest, through his heart, inches to the left of its actual trajectory along the right side of his rib cage. Myers has Connally so far to his left he's falling off his seat, and it's still not far enough.

Myers undoubtedly knows this. Which fuels my suspicion that the distorted animation used in Beyond the Magic Bullet was no "mistake".

The Defense of Dale Myers II

On May 8, 2008, my ongoing suspicion that Myers was party to a deliberate deception brought about the following response, posted on his website. It was subsequently posted on the alt.assassination.jfk newsgroup by David Von Pein.

Con Job: Debunking the Debunkers (by Dale Myers):

"It's been thirteen years since I released my preliminary computer-generated JFK assassination reconstruction and five years since an updated version was broadcast world-wide, although you'd never know it given the frequency with which the History and Discovery Channels re-broadcast the two programs my work appeared in.

And consequently it's no wonder that conspiracy theorists continue to hammer at my work in the hopes of convincing mainstream America that my computer reconstruction is nothing more than a carefully constructed sham designed to further a supposed cover-up in the murder of President Kennedy.

The newest crop of debunkers push their warped ideas about my work with graphic illustrations and self-produced YouTube videos which purport to show the "obvious" lies and distortions these theorists have supposedly discovered among sequences of my work aired by the History and Discovery Channels.

One of the more vocal and equally off-base debunkers is Patrick J. Speer, a self-acknowledged wanna-be poet, turned wanna-be-musician, turned record buyer for the music industry who eventually became "obsessed with recent American history."

Mr. Speer's graphic intensive website promises "a new perspective on the Kennedy assassination" and while some newcomers to the subject may be impressed with the eye-candy, there's nothing really there that rises above the same old, tired arguments and misinformation kicked around by conspiracy theorists for better than four decades.

It's the same old shoe with new laces.

There are plenty of identical websites that offer up the same kind of misinformation for those who don't know any better and if visitors to these kinds of websites are willing to get their facts about American history from wanna-be poets and the like, who am I to spoil the party?

In fact, I've largely avoided confronting this army of wackiness, outside of addressing a few of their more frequent allegations, because doing so proves time and again to represent a colossal waste of time.

It doesn't take long to figure out that one could waste a lifetime attempting to hammer a little common sense into these people who for one obsessive reason or another find it their calling to opine about something they know very little about, or in the case of Mr. Speer, know absolutely nothing about.

I'm referring of course to the multitude of vile and reckless charges concerning my computer

reconstruction of the Kennedy assassination which are featured as part of Mr. Speer's "new perspective" on the case.

Utilizing screen grabs lifted from the two television programs I participated in, Mr. Speer pretends to debunk my work using graphic overlays that break every rule of photogrammetry accompanied by childish headlines like Dale Myers' House of Mirrors; Murder by Cartoon; and Cutting the Crap.

I pointed out Mr. Speer's photographic follies on my FAQ page over three years ago (without using his name in order to save him embarrassment), yet Speer continues to use the same deceptive photographic techniques to – get this – claim that he has evidence of my deception.

For instance, Speer uses overlays of images taken from two different angles and claims that because they don't align I am being deceptive; or, Speer draws lines of trajectory on a two-dimensional image of a three-dimensional scene and claims that because the two-dimensional line doesn't line up with the three-dimensional scene (an impossibility due to the basic rules of photogrammetry) that I am being deceptive.

Forget about convincing Mr. Speer that one cannot draw a rational conclusion from an irrational premise; I've tried. Suffice it to say that Mr. Speer prefers to live in a land of illusion where physical realities don't hold a candle to obsessive conspiracy theories.

I'm not going to spend a lot of time here pointing out the ridiculous nature of each and every one of Mr. Speer's goofy assertions. But here are just two to make the point, as well as the truth of the matter:

Charge: Myers shrunk the model of Governor Connally and his jumpseat 25% in order to get the single bullet theory to work.

Truth: Mr. Speer used a frame grab from the Discovery Channel's "Beyond the Magic Bullet" to make his point, but failed to note that the image he used was taken from a portion of the program in which my computer work was being displayed on a computer monitor which was at a significant angle to the camera – the effect being that the computer images of Kennedy and Connally were compressed horizontally and consequently the Connally image appeared smaller than the actual model.

When Mr. Speer was informed that wide-angle sequences from the Discovery program showed the relationship of the computer monitor to the program camera (and therefore the fallacy of his argument), he wrote on his website, "I must admit I did not realize this footage was shot at an angle. I mean, why would they do that?" Believe it or not, Mr. Speer then proceeded to claim that the producers of the program and I conspired to deceive viewers (and presumably the hapless Mr. Speer) about the true alignment of the single bullet theory by purposely shooting the monitor on an angle!

Can it get any sillier? I'm afraid it can.

Charge: Myers misplaces Connally's jumpseat in order to ensure the alignment of the single bullet theory.

Truth: The location of the jumpseat has no bearing on the alignment of any trajectory plotted in my computer reconstruction. The figures of JFK and JBC were matched to the Zapruder film perspective, not to the location of the jumpseat. Frankly, you could eliminate the entire limousine from the reconstruction and the alignments of JFK and JBC would still be valid since their position in space is based on Zapruder's view of the scene and the relationship of JFK to JBC, and their combined relationship to the TSBD and the surrounding buildings. In short, the position and size of the jumpseat has no bearing on the single bullet theory.

All of this means little to Mr. Speer who now writes, "As he is now asserting that the limousine model had nothing to do with his positioning of Connally, only measurements taken from the Zapruder film, I

decided to put the seat in the correct location on Myers' undistorted over-view, and see how it matched up with Connally...."

Does it matter that Mr. Speer cannot really move the jumpseat to the "correct" location within my computer rendering (i.e., move a two-dimensional image in three-dimensional space)? Apparently not, because Mr. Speer then proceeds to once again break the Cardinal Rule of photogrammetry (i.e., draw two-dimensional lines on a three-dimensional image) to "demonstrate" that Connally doesn't align with the single bullet trajectory, concluding, "Myers undoubtedly knows this. Which fuels my suspicion that the distorted animation used in 'Beyond the Magic Bullet' was no 'mistake'."

One can only feel sorry for Mr. Speer after reading such nonsense. The only one being conned by such addled thinking is Mr. Speer himself who despite all efforts is determined to prove just how thick-headed conspiracy theorists can truly be.

Anyone who wants to pretend my reconstruction work is false or doesn't matter is free to do so. As I've said before, in the final analysis, the truth doesn't require anyone's belief.

I don't respond to posts on the many Internet newsgroups because of the sophomoric nature of the vast majority of the postings (and I know many respected experts on the assassination who feel the same way). It is the insipid name-calling and disrespect for honest research and work that I (and others) find the most appalling. It is worse than a kindergarten sandbox.

Too bad. The Internet promised to bring people of common interests together. Instead, it gives a global soap box and a megaphone to those who have the least amount to say.

On occasion, I feel the need to defend my work against these childish armchair detectives if only to plant a little sanity in a field of nonsense. Unfortunately, whenever I speak up, it only seems to bring more nuts out of the woodwork for yet another round.

It's a never ending cycle of lunacy; one ridiculous argument after another to see who can be the top fool.

Congratulations, Mr. Speer! You're TOPS with me."

-- Dale K. Myers; May 8, 2008

On May 10, 2008, Myers responded again, by adding on to the above message. This response was once again posted on the alt.assassination.jfk message board by David Von Pein.

"In a recent post on the UK's Education Forum, Mr. [Patrick J.] Speer writes, "No one to my knowledge, including Myers, until this response, had ever suggested the images were distorted because the animation – the animation shown round the world to convince people the single-bullet trajectories worked, mind you – was shot at an angle from a computer monitor."

Mr. Speer doesn't seem to understand that in the real world there is no need to acknowledge something that is self evident--namely, that Discovery Channel viewers were watching a presentation being given from a vantage point that was not perpendicular to the presentation screen. This is obvious from the Discovery program sequences that show a wide-angle view of the studio in which the presentation was being given. Mr. Speer failed to note that fact and now claims that the Discovery Channel and yours truly conspired to deceive everyone about the single bullet theory.

The so-called distortions Mr. Speer refers to are of course the unintended result of the Discovery Channel photographing the presentation monitor at an angle and have nothing to do with the alignments depicted in the actual images appearing on the monitor. And the trajectory path superimposed over the videotaped sequence by Discovery editors after the fact has no more relevance

or accuracy to the images below it (other than to illustrate, in very broad terms, the path of the bullet) than Mr. Speer's own attempts to project two-dimensional lines into three-dimensional space.

It's unfathomable to me that anyone could swallow Mr. Speer's illogical rationale for dismissing the breadth of my work on the single bullet theory, but in the world of conspiracy theorists bent on embracing anyone and anything critical of the single bullet theory, such idiocy is common place. (The UK's Education Forum's administrator, John Simkin, applauded Speer writing, "Congratulations. I am sure all members have been very impressed with your work in this area.")

[Later....]

Mr. Speer further complains that the animated sequence I produced in which Connally is shown sitting inboard of Kennedy by six inches is equally deceptively because it shows Connally and the jumpseat moving in unison. I explained in a recent email that Connally and the jumpseat were moved as one for clarity.

According to Mr. Speer, "This is as good as a confession that Myers knew the jumpseat was not 6 inches in from the door when he created animation showing it to be 6 inches from the door... I wonder how many [millions of viewers] would feel deceived to find out that Connally's sitting comfortably in the middle of his seat was merely a Myers invention designed to 'clarify' things for them? Some might call this an out-and-out fraud perpetrated on the public."

I don't know how many ways to say it, but Connally was situated six inches inboard of Kennedy at the time they were both hit. Connally's jumpseat, however, was fixed to a track in the floor of the limousine, the outside edge of the jumpseat cushion measured at 2.5 inches from the inside door panel, according to body drafts produced by Hess & Eisenhardt Company.

To demonstrate the difference between a rather common (and inaccurate) drawing purporting to show Connally seated directly in front of Kennedy at the time of the single bullet shot and their actual positions as deduced from the Zapruder film and other photographs, the models of Connally and the jumpseat were moved as a single unit during presentations for ABC News and the Discovery Channel.

The relationship between Connally and the jumpseat are identical in both positions. Moving Connally and the jumpseat in unison was simply easier than moving the two separately given the television time available – especially given the fact that the position of the jumpseat had absolutely no bearing on the single bullet theory.

But for Mr. Speer, focusing on inconsequential minutia is better than acknowledging his own obvious mistakes in photographic analysis and logic. It also allows him to play the martyr for his fellow conspiracy theorists and pretend he has actually proven something."

-- DALE K. MYERS; ADD-ON SECTIONS TO HIS MAY 8TH ARTICLE

Let's recall here that, on Myers' website, he defends the accuracy of his animation by stating:

Connally was turned to his right and had shifted left on the jump seat in front of Kennedy. Projecting an imaginary line forward from the center of the both men shows that the difference between their two center points is six inches. Connally's jump seat, which was about 20.5 inches wide, was correctly located 2.5 inches from the inside of the right-hand door."

Now let's point out that, as a response to my demonstrating that this last statement is untrue, and that the seat on his overhead views is in fact 6 inches in from the door, rather than refute my demonstration, Myers now claims:

The location of the jumpseat has no bearing on the alignment of any trajectory plotted in my computer reconstruction. The figures of JFK and JBC were matched to the Zapruder film perspective, not to the location of the jumpseat. Frankly, you could eliminate the entire limousine from the reconstruction and the alignments of JFK and JBC would still be valid since their position in space is based on Zapruder's view of the scene and the relationship of JFK to JBC, and their combined relationship to the TSBD and the surrounding buildings. In short, the position and size of the jumpseat has no bearing on the single bullet theory.

He has also offered this explanation for his placing the seat 6 inches from the door when, as he now admits, it was not:

I don't know how many ways to say it, but Connally was situated six inches inboard of Kennedy at the time they were both hit. Connally's jumpseat, however, was fixed to a track in the floor of the limousine, the outside edge of the jumpseat cushion measured at 2.5 inches from the inside door panel, according to body drafts produced by Hess & Eisenhardt Company.

To demonstrate the difference between a rather common (and inaccurate) drawing purporting to show Connally seated directly in front of Kennedy at the time of the single bullet shot and their actual positions as deduced from the Zapruder film and other photographs, the models of Connally and the jumpseat were moved as a single unit during presentations for ABC News and the Discovery Channel.

The relationship between Connally and the jumpseat are identical in both positions. Moving Connally and the jumpseat in unison was simply easier than moving the two separately given the television time available – especially given the fact that the position of the jumpseat had absolutely no bearing on the single bullet theory.

So...according to Myers, it was "easier" to depict Connally incorrectly on the middle of his jumpseat, than to depict him sitting leftward in his seat, where Myers insists he was actually sitting. That this deliberate misrepresentation deceived people into believing Kennedy and Connally were in "perfect" alignment for the single-bullet theory to be true, was, according to Myers, never a consideration. Apparently, he believes an overhead view demonstrating the single-bullet theory with Connally sitting on the left side of his seat would be just as believable to the viewers of Beyond Conspiracy and Beyond the Magic Bullet as an overhead view of Connally sitting comfortably in the middle of his seat.

Myers, who claims to have studied the Zapruder film intensely, and to have figured out Kennedy's and Connally's locations in the film with precision, never even offers us the frame number in which Connally suddenly slides to the left in his seat. If he had isolated such a moment, one would think he would mention this on his website or on his television appearances.

Methinks the boy's been caught with his hand in the cookie jar.

Lost in the Trees

Above: Myers' depiction of the sniper's nest view circa 160, courtesy a Youtube video claiming his animation as proof the first shot would have been deflected by a tree.

PHOTOGRAPH THROUGH RIFLE SCOPE

Above CE 888: a photo taken by the FBI through the scope on Oswald's rifle on May 24, 1964. This particular photo demonstrates the limousine's location at Z-161.

A close look at the Warren Commission's exhibits and testimony demonstrates that Myers' depiction of a first shot is a false one. Not only does he exaggerate the magnification of Oswald's scope, but he depicts the shot coming when Kennedy was well-hidden by the foliage of a tree. The Warren Commission held that Kennedy was, in fact, sitting 10 inches lower in the limousine than the stand-in used in their re-enactment, and that, as a result, Kennedy's back wound location was not obscured by foliage until frame 167.

Lost in the Trees

In March 2008, I came across yet another link on a Kennedy assassination internet forum to Myers' work, this one claiming that Myers' animation demonstrated that the first shot would have been likely to hit a tree and be deflected. After taking a look, I realized that the creator of the thread was right: Myers' animation DID present the first shot heading into a tree. But he was also wrong: this didn't demonstrate that the bullet would have been deflected, but that Myers is not a researcher but a propagandist, with little concern for the historical record or the truth.

Anyone claiming to have studied the shooting in the detail necessary to create a simulation would have to know that on May 24, 1964, during the Warren Commission's re-enactment of the shooting, FBI agents Robert Frazier and Lyndal Shaneyfelt took a series of pictures from the sniper's nest, through the Mannlicher-Carcano rifle's scope, and correlated these photos to exact moments in the Zapruder film. In *Beyond Conspiracy*, Myers articulates "Around frame 160 is approximately the time of the first shot." On May 24, 1964, the FBI took a picture of the limo at frame 161. This SHOULD have been the basis for Myers' animated depiction of the limo at the time of the first shot. This photo shows the President's stand-in just heading behind a tree. The FBI, in fact, concluded that Kennedy's back wound location was not obscured by the tree until frame 167. And yet, at the moment of the first shot in his animation, Myers has the limo almost completely hidden by the tree, all the way down to the

limousine's trunk. (It appears he also exaggerates the magnification of the scope.)

Even Myers' cohort Vincent Bugliosi knows this is a deception. On page 471 of *Reclaiming History*, Bugliosi writes, if the first shot "was fired between Z143 and Z160, it would not have hit any significant twig or branch of the oak tree (from the sniper's nest only a few leaves and branchlets are visible, at the edges of the tree, around frame 160) as some have theorized, since the bullet would have been fired before the limousine disappeared under the branches."

Myers' depiction of the limousine behind the tree at this point, then, convinces me that the *raison d'être* behind his animation was not to demonstrate anything but to SELL something, namely, that the magic bullet theory is the single-bullet fact. By having the first shot ring out when Kennedy was behind the tree, after all, Myers was able to explain why, according to the currently popular single-assassin scenario, the first shot missed and wounded James Tague on the other side of the plaza. Never mind that Kennedy was not yet behind the tree. Never mind that Tague felt he was hit by the second shot.

An article in the May 28, 2007 Provo, Utah Daily Herald about Vincent Bugliosi's book *Reclaiming History* quotes Myers extensively, and gives us some insight into his possible motivations. It concludes: "Myers points to a 'false history' encircling the assassination and says that, as a culture, we have already incurred 'tremendous damage, which has a bigger impact on this country than most people realize. We are now thoroughly and unthinkingly a conspiracy culture. We embrace conspiracy far quicker than we're willing to weigh facts. The Kennedy assassination has become the granddaddy of all conspiracies, and it saddens me. I wonder, really, if we'll ever get beyond it.'"

Presumably, just as he insisted that he misled people about the position of the jump seat "for clarity," Myers' additional misrepresentation of the facts has been designed to help people get beyond their unwillingness to weigh facts. Hopefully we can still "get beyond" the "tremendous damage" caused by his deliberate presentation of a "false history," but I have my doubts. I mean, when was the last time a major television network admitted that one of their award-winning programs was a deliberate deception? It just doesn't happen.

Dale and the Dal-Tex

Above: an over-view by Myers on his website. The trajectory cones mark his margin of error. Although Myers admits the R-L angle of the bullet into the car was 10 degrees the angle on his close-up is only 4 degrees. (A blue line, at 10 degrees, has been added).

When one looks closely at the limo on Myers' long view of the trajectory, at bottom left, other deceptions become clear. For one, Myers starts this trajectory from the middle of the limousine, and not its right side. For two, he has the limousine turned leftward in its lane. When these mistakes are corrected, as at right, the trajectory (black line) points to the Dal-Tex.

Dale and the Dal-Tex

In April 2008, one of Myers' supporters argued online that Myers has the jump seat in its proper location on an image on his website. Naturally, I took a closer look at this image. I concluded he was wrong. As shown on the slide above, the top of the jump seat is in line with the right side of Kennedy's neck, and the top part of Connally's arm. This would be unlikely if it was only 2 1/2 inches from the door.

While looking at this image, an overview of Dealey Plaza, showing Myers' trajectory cone of possible error projected back from the limo, with an insert of the overview within the limo, a few more deceptions became apparent. While one might wish to call them mistakes, it's truly hard to believe these "mistakes" were purely accidental.

Deception #1 is that the angle of trajectory on the inserted close-up does not match the 10 degree R-L angle Myers admits was the actual angle. The angle of trajectory appears to be more like 4 degrees. While the image appears to have been taken from slightly right of the limousine, the resultant distortion would make the angle appear greater than its actual angle, not significantly smaller. When one inserts a 10 degree line of trajectory onto this image, furthermore, the bullet striking Kennedy's back from 10 degrees to its right, impacts on the middle of Connally's back, and not his armpit. By now, this should hardly be surprising.

Deception #2 is that the angle on his over-view of the plaza starts off from the middle of the limousine, not its far right side, which Myers holds is the location of Connally's armpit

Deception #3 is that, not unlike Court TV before him, Myers has the limo swerving to its left just as the shot is fired. This swerve is not apparent on the Zapruder film, nor was it reported by any of the witnesses.

When one corrects the position of the limo within its center lane, and begins the trajectory from Connally's right armpit and not the center of the limo, the trajectory points back to the Dal-Tex Building. This is not surprising, and is precisely as concluded previously. (While some will no doubt claim I'm distorting the facts to push my own agenda that this shot came from the Dal-Tex, I don't believe that the bullet creating Kennedy's back wound and the bullet creating Connally's back wound were the same bullet, so the alignment of these wounds is relatively unimportant.)

Let's recall here that Myers, in his online defense to my criticisms, wrote:

Incidentally, the critic never offers any facts to support his claim that positioning Kennedy properly in the limousine would result in a trajectory that traced back to the Dal-Tex building.

That's right, Dale. I let you do it for me.

Myers vs. Myers

If the image at left, the basis for the trajectories below, is also the basis for the moment of impact in the completed shooting segment (at right), why is the back seat at a different angle? And what happened to Kennedy's knee?

And if the bullet is heading in a straight line left to right, why does the bullet travel parallel to the grid lines of the limo (as at left), and then change angles after exiting JFK (as at right)?

These images, from Beyond Conspiracy, lead me to doubt that Myers' animation is locked in space, and consistent from frame to frame. The white line added on to the image at bottom right is an attempt to demonstrate the angles of the trajectory heading into and out of Kennedy and that they differ slightly. They shouldn't.

Myers vs. Myers

When I re-watched my video of Beyond Conspiracy, to take a closer look at Myers' pre-distorted animation, I noticed something that made me suspect that Myers' computer models are not even fixed in space. On a view of the single-bullet shot from in front of Connally, in which one can see the exit location on his jacket, one can see Kennedy behind Connally, and slightly to his left. The problem is that in order for the trajectory from the sniper's nest to work Kennedy needs to be sitting to Connally's right. I've stared and stared at this image (in the top left corner on the slide above) and have been unable to convince myself the figure is to Connally's right. (If anyone reading this thinks I'm being daft about this, please let me know.) Even more confusing, however, is that when I watched the completed animation of the single-bullet sequence, it became apparent that Kennedy and Connally were in this same position, but that the back seat was now at a different angle. This led me to suspect that the Kennedy and Connally figures used in Myers' overhead trajectories were not fixed in space, and attached to the limousine model in a consistent manner.

With these doubts in my mind, I watched his animation again, and noticed other apparent anomalies. At one point in Beyond Conspiracy, it shows the single-bullet shot from above and to the right. The bullet trajectory runs parallel to the grid lines of the limousine. Since the bullet, by Myers' own admission, was heading 10 degrees right to left, this appeared to make no sense. Upon further reflection, however, I realized that the bullet's descent would, at certain angles, give the appearance of a left to right trajectory, and that there would be an angle where the descent would counter-balance the actual right to left trajectory, and make it all look like a straight line.

Just a split second later, however, I noticed something that I still can't explain. As the camera changes angles to view the shot from directly above Kennedy and Connally, the bullet trajectory heading into Kennedy, for just a brief moment, appears to be at a different angle than the bullet trajectory heading out of Kennedy. When I captured this image I found that the red line heading into Kennedy was indeed incongruent with the red line heading out of Kennedy. If the bullet was on a straight trajectory, as purported, this makes little sense.

As a result, I continue to suspect that Myers' animation was, in fact, a cartoon, with ever-changing angles and proportions, only designed to look consistent from frame and frame, and somehow scientific. People tend to trust technology. Remember that scene in the Wizard of Oz, where the wizard uses his machines to belch out smoke and fire, and tells everyone to never mind the man behind the curtain? I think that's Myers, only he's the...Wizard of Oswald. (Yeah, yeah, I know.)

It's the Shirt, Stupid

By stretching JFK's neck, and lifting the jacket to JFK's nose, as in the images at left and above, Myers was able to lift the jacket hole well above the throat exit. But what about the hole on the shirt? Why didn't he even try? (Images from Beyond Conspiracy.)

The above photo, by Phil Willis, shows JFK's shirt to be at the level of his jacket.

Well, perhaps Myers saw that his location for the backwound was still too high to align with the jacket hole, (as shown in the images above) and could never be made to align with the hole in JFK's shirt, well below his shoulders (as shown by the blue line).

National Archives photo of JFK's shirt.

In any event, by 2004's Beyond the Magic Bullet, Myers had given up and had lowered the jacket back down to match the shirt.

It's the Shirt, Stupid

As I re-watched Beyond Conspiracy, I noticed something else I hadn't noticed before, which led me to further doubt Myers' honesty. When showing the single-bullet trajectory from a point in front of Kennedy, the animation briefly becomes see-through, so that one can see the bullet trajectory in Kennedy's neck. The bullet on this trajectory impacts well below Kennedy's jacket collar. The problem is that Kennedy's jacket collar is depicted well above Kennedy's shirt collar, and the bullet appears to have entered just below Kennedy's shirt collar. This gave me pause.

The hole on Kennedy's jacket, as testified to by FBI agent Robert Frazier before the Warren Commission, was $5 \frac{3}{8}$ inches below the top of his jacket collar. The hole on Kennedy's shirt, as testified to by Frazier, however, was $5 \frac{3}{4}$ inches below the collar. This means there was more shirt above the bullet hole than jacket. Which means Myers' animation is clearly inaccurate on this point.

I tried to put myself in Myers' position. By stretching out the neck on his Kennedy model, and having the jacket creep up the back of the neck to almost the level of the nose, Myers had successfully lifted the bullet hole on the jacket to align with his proposed trajectory. But how could he do this with a shirt? How could he make the argument that Kennedy's shirt had slid inches upwards on his body, and that a bullet hole undoubtedly inches below the shoulder line on this shirt had in fact overlay the base of Kennedy's neck? I mean, how does one slide that much material up above Kennedy's shoulders,

without it becoming obvious, and appearing ridiculous?

One doesn't.

Myers almost admits this on his website, in his usual question and answer style.

Myers responds by asking: "Isn't it true that you blatantly misrepresented the shape of Kennedy's back to get the single bullet theory to work?"

Myers answers: *"No. Several critics have pointed out that Kennedy's posture appears distorted in the animation. One critic wrote, 'I still cannot figure out why Myers made JFK a hunchback. Was that the only way to achieve a downward trajectory projection between the back injury and the neck wound?' Another critic wrote, 'The blatant misrepresentation of the shape of the back is the sort of thing which makes me dismiss everything that Myers tries to 'prove' with his animation. If he's willing to lie to his audience to make his point, then he deserves no consideration whatsoever.'"*

This criticism stems from some modeling and animation issues that were not fully resolved at the time of the ABC Television broadcast. The issue is ultimately a cosmetic one and has nothing to do with the trajectory analysis or its conclusions, as these critics falsely suggest.

Photographs and films taken during the course of the motorcade show that the president's suit jacket had ridden or bunched up, making his shoulder line appear to be higher than it actually was. When shot, the president's elbows rose dramatically, increasing the effect. While animating the shooting sequence, the shoulders and collar of the president's computer generated "clothing" was raised off the shoulder line of the human model beneath to mimic what is seen in the film. Due to modeling constraints, the collar could not be returned to its proper position without affecting the shoulder line. To get the clothing to "look right," the model would have to be redone, a luxury I did not have time to complete given the production schedule. That's showbiz. While the position of the collar was not a perfect match with the film (in fact, it is too high in its current position), the shoulders, as defined by the "clothing," did fit better with what is seen in the Zapruder film. In the end, because of time constraints, it was decided to leave the "clothing," including the collar, in the raised position throughout the animated sequence. Contrary to the criticism levied by my detractors, the position of the president's clothing in the recreation has nothing to do with the validity of the single bullet theory. That's because the human model representing Kennedy, which is positioned beneath the "clothing," and therefore hidden from view, has not been moved. Only the "clothing" has been tugged around. As explained elsewhere on this page, it is the location of the wounds on the body, not the "clothing," that is the basis for defining the trajectory path of the bullets."

Note that Myers' doesn't even bother to pretend the entrance holes on the clothes of his Kennedy model are accurate.

Since Myers' 2004 animation in Beyond the Magic Bullet failed, for the most part, to even depict the bunching of the jacket collar, it seems apparent that he realized the futility of his situation and decided to just ignore the hole on the shirt and the uncomfortable fact that it casts doubt upon his theories.

The Head Snap That Never Was

Across the top, from L to R: Kennedy in 4 frames from Myers' cartoon.

Across the bottom: Zapruder frames 188, 198, 206 and 224.

When one compares the actual frames of the Zapruder film before and after Kennedy heads behind the sign to Myers' depiction of Kennedy during this period, one can't help but notice that something is missing. Myers fails to reproduce Kennedy's rapid head snap to his left between frames 193 and 198, and instead shows Kennedy leisurely turning to his left as he drops his hands. Still, look at Kennedy's hands in Myers' frame 224. This man is reacting to a hit.

The Head Snap That Never Was

Since Myers had admitted his lack of interest in accurately depicting the bullet holes on Kennedy's clothes, it occurred to me that he would deliberately ignore other aspects of the shooting as well, should they not fit in with his agenda. I decided to watch his animation in slow mo and see if it depicted Kennedy's head snap between frames 193 and 198 of the Zapruder film. Not surprisingly, it did not. The sequence of the film of which HSCA photographic panel spokesman Calvin S. McCamy had noted "At this point there is considerable blur, and by here, it appears as though his head is beginning to turn quite rapidly to the left. His head is now to the left. That is only one-eighteenth of a second from one frame to the next" was left off Myer's animated version of the shooting, and replaced by Kennedy smoothly waving to his right and calmly turning to face straight ahead just before being shot.

That's right. I wrote "smoothly waving." While one might try to explain Myers' excising the head snap by claiming he failed to notice it, and was convinced Kennedy's right ear in frame 198 was his nose, one cannot possibly defend his failure to note that by frame 198 Kennedy's right wrist and shirt have shot up out of his jacket. (This is readily apparent on the slide above.)

I re-read Myers' website to see if this incredibly obvious omission had an explanation. Like most people, I'd assumed he'd created his animation by drawing over the frames of the Z-film, and had meticulously compared his animation to the film in order to spot any inaccuracies. In his award-

winning program Beyond Conspiracy, Peter Jennings had, after all, spouted that "Myers has generated an exacting computer simulation of the Zapruder film. He began by constructing a 3-Dimensional scale model of Dealey Plaza...On top of the Zapruder film, he then animated the movements of President Kennedy and Governor Connally, frame by frame." Computer Graphics World, in January 2004, had, after all, said much the same thing, reporting: "After building the models and the background, Myers worked frame by frame..." and then quoting Myers' claim that, once he determined the precise positions of Kennedy and Connally in the car, and enlarged the portion of the film showing both men in center frame, "we had a frame-for-frame digital match of the Zapruder film."

And these were not the only claims that the film was re-produced frame for frame and was exact. In March 2004, Broadcast Engineering jumped on board, informing its readers that, as early as 1995, Myers' wire-frame models "matched each frame of the only real-time visual record of the event"...the Zapruder film. The importance of this "exactness" to the popular acceptance of Myers' work, and the programs in which it's been featured, moreover, can not be overstated. To this day, Tivo summarizes the program Beyond Conspiracy as "An exact computer simulation of the famous Zapruder film offers surprising results."

Well, it turned out that this "exactness", like so much of the hype about Myers' animation, was not exactly true. On his website, Myers admits:

"The clearest frames of the Zapruder film were sought for positioning JFK and JBC in order to minimize any errors. Key frame positions were generally placed at half-second intervals throughout the recreation, although tighter keying patterns (1-5 frame intervals) were employed during Zapruder frames 220-238, and 312-330.

The resulting animation was spot checked against the original Zapruder film to insure an accurate representation. Where "drifting" was detected, additional key frames were used to nail down the action.

It took six weeks to complete the key frame process, after which a test render was produced. The resulting animation was a computer generated "hand-held" version of the Zapruder film. In essence, the key frame process had created a motion file of Zapruder's camera in 3D space. Stepping through each frame of the animation revealed how Zapruder held his camera while trying to follow the limousine as it moved down Elm Street."

Yes, you got that right. Myers' supposedly precise re-creation was only compared against the film every nine frames (or "half second") prior to frame 220! My, ain't that convenient! The HSCA photographic panel said they believed Kennedy was hit just before he went behind the sign, well before frame 220, but Myers either never saw fit to intensely study this part of the film or deliberately avoided studying it because it would destroy the illusion he'd tasked himself with creating.

It's not as if Myers was unaware of the HSCA's conclusions. As pointed out by Milicent Cranor in her excellent essay on Myers entitled Lies for the Eyes, in 1994 Myers wrote an article for a magazine called Video Toaster User, and claimed "*The House Select Committee on Assassinations interpreted the blurry images between Z-189 and Z-197 as an indication that JFK had been shot... It appeared... that JFK's right hand 'froze' at this point. However, the computer re-creation reveals something else -- a sharp, abrupt continuation of JFK's turn to his right... it is clear that the president was tracking the women at curbside.*"

This is not only hard-to-believe, it is truly disgusting. Apparently Myers was so intent on studying individual frames of the film--Kennedy's right ear in frame 198 can indeed be confused with his nose--that he forgot to study the pictures in motion--which make it abundantly clear Kennedy suddenly turned to his left (and NOT right) at this point. That Myers attributed this non-existent turn to the right

to Kennedy's womanizing is, furthermore, suggestive of a dislike for JFK, and indicative that perhaps this dislike had clouded his vision and led him to conclude the HSCA photography panel had simply been seeing things.

Speaking of seeing things... Myers' discussion of his methodology makes it clear that he picked out a frame from sometime before Kennedy went behind the sign, and then another as Kennedy emerged, and created a nice, flowing, COMPLETELY IMAGINARY depiction of what happened in between. He then convinced the media that this depiction, pulled straight from his imagination, somehow debunked the HSCA's conclusion that Kennedy was hit before he went behind the sign. Simply incredible!

When one compares Zapruder frames 180 and 207, 1 ½ seconds apart, one can see that First Lady Jacqueline Kennedy has turned her head sharply to her right. When one inspects Zapruder frames 207-212, moreover, it's clear that she has looked directly at her husband, just after he has jerked to his left. What made her look at him? What did she see?

Follow the Bouncing Pink Hat

While discussing Myers' use of shadow in his animation, and noting that Myers used shadows that he admittedly did not see to demonstrate that Kennedy's arm was above the right side of the limousine, I mentioned that it seemed strange that Myers would include unseen shadows in his animation, and unimportant trees and bushes, while failing to depict Jacqueline Kennedy. An article about Myers in the January 2004 edition of Computer Graphics World reflects that he left the other limousine occupants off his animation for "visual clarity and to streamline the modeling/animation process." One might wish to believe him.

Upon closer study of the film, however, I believe that his omission of Mrs. Kennedy was no accident. When one studies the movements of the first lady as she heads behind the sign, including her behavior in frames 208-211, removed from the original film by Life Magazine, it is clear that she turns her head to look at her husband. This is, according to Myers, BEFORE Kennedy has even been shot.

In the October 1971 Journal of Forensic Sciences, Don Olson and Ralph Turner noted Mrs. Kennedy's movements during this period, and correlated it to the testimony of four witnesses.

They quoted Mrs. Kennedy herself (5H180): "I was looking this way, to the left, and I heard these terrible noises...So I turned to the right. And all I remember is seeing my husband, he had this sort of quizzical look on his face, and his hand was up...I used to think if I had only been looking to the right, I would have seen the first shot hit him." (Hmmm..."His hand was up." Is it a coincidence that Kennedy's hand--singular--is up as he heads behind the sign, but not after he comes out from behind the sign, when both hands are rising up to his neck?)

Olson and Turner also quoted three supporting witnesses. First, Phil Willis (7H496): "Mrs. Kennedy was likewise smiling and facing more to my side of the street. When the first shot was fired, her head seemed to just snap in that direction..." (This snap can be seen between frames 188 and 207.) Second, S.M. Holland (6H243): "about that time he went over like that and put his hand up, and she was still looking off...His right hand; and that was the first report I heard...she turned around facing the President and Governor Connally. In other words, she realized what was happening." (Again, with Kennedy's hand being up.) Third, Kenneth O'Donnell, riding in the follow-up car (7H449): "she appeared to be immediately aware that something had happened. She turned toward him."

In light of Mrs. Kennedy's recorded movements on the Zapruder film, and the eyewitness statements correlating these movements to the aftermath of a first shot hit, it seems mighty convenient that Myers left the first lady off his animation. After all, her appearance may very well have led some to think Kennedy was hit before Connally, and that his single-bullet "fact" is a sham. That Myers' animation leaves off both Kennedy's head snap, and Jacqueline Kennedy's turning to look at him just after this head snap, is undoubtedly suspicious. While I regularly argue against conspiracy theorists purporting that someone is a disinformation agent or some such thing, I find it incredibly hard to believe Myers never noticed Kennedy's head snap, or Jackie's looking at Jack, or that his animated back wound location is inches above the back wound location on the autopsy photo, etc.

On his website, Myers boasts:

"It is important to note the distinction between this computer study and other similar work done in this area. Past computer studies - produced by PBS/Nova and Failure Analysis Associates (FAA) - were illustrative renderings of various theories about the assassination. In other words, they demonstrate what might have happened in Dealey Plaza. This is the first computer study to examine Abraham Zapruder's filmed record in three-dimensions, allowing precise measurements of the motion recorded on film. In essence, this computer study allows us to examine the actual event with an incredible degree of accuracy never before possible. In addition, the dimensional nature of this project presents the opportunity to test various theories against the facts of the shooting as revealed by this study."

I find my standard response of "Hogwash!" to be grossly inadequate. I find my more active response of "Bullshit!" nearly as inadequate. Words simply fail me in the face of such toxic malarkey.

Yes, I find that Myers' animation and his assertions of its accuracy are truly BEYOND BULLSHIT.

In the interest of fairness, however, I'll let Myers have the last word. From his May 8, 2008, response to this website:

Forget about convincing Mr. Speer that one cannot draw a rational conclusion from an irrational

premise; I've tried. Suffice it to say that Mr. Speer prefers to live in a land of illusion where physical realities don't hold a candle to obsessive conspiracy theories.

Door to Door

And so it rested...until April 2012, when conspiracy theorist Anthony Marsh tried to convince me Kelley and Myers etc were not lying when they said the jump seat was 6 inches inboard of the door, but were simply incorrectly representing the reality that the door by the jump seat intrudes into the passenger compartment alongside the jump seat, and that, as a result, the right side of Connally's seat was 6 inches to the left of the right side of Kennedy's seat.

Well, this caught me by surprise. This wasn't how Myers had defended himself when this was all fresh in my mind. Myers had as much as acknowledged that Connally's seat was but 2 1/2 inches to the left of Kennedy's, but had insisted that Connally had slid to the left in his chair, so that he was sitting 6 inches to the left of Kennedy at the time of the shooting.

Still, curious, I just had to go back and take another look at HSCA Figure II-19, in which the measurements for the limo were provided. Well, for a second I was concerned. As demonstrated and explained on the slide above, the measurement across the jump seats is 6.75 inches less than the measurement across the back seat. This led me to briefly conclude that the door does in fact intrude into the passenger compartment to the degree claimed by Marsh. I then took another look, and realized I was comparing apples with oranges. The measurement across the jump seats measures the distance to the inside of the door, while the measurement across the back seat measures to the trim on the outside

of the limo, several inches outside the inside of the door.

This led me to conclude that the right side of Connally's jump seat, while being but 2.5 inches from the inside of the door, was about 3.75 inches to the left of the right side of the back seat.

While I briefly considered going back and changing all the slides in which I presented Connally's seat as being 2.5 inches to the left of Kennedy's seat to reflect this more accurate assessment, I soon decided against it. While I now believe Kennedy's seat extended 3.75 inches to the right of Connally's seat, I have never been convinced Kennedy availed himself of every last inch of this space. In fact, it's counter-intuitive to assume such a thing. I don't know anyone who sits in a car, of any type, with their butt slid all the way up against the side of the car. And I bet you don't either.

As a result, we can only assume this extra inch or two of space along the right side of the back seat was...dead space, unoccupied by the lower half of Kennedy's body, at least while he was alive.

Chapter 13: Solving the Great Head Wound Mystery **Making sense out of nonsense**

Warren Commission Exhibit CE 388/ Zapruder Frame 312 Comparison

Warren Commission
Exhibit CE 388

Warren Commission
Exhibit CE 388 corrected to
match Zapruder frame 312

For reasons beyond my grasp, the first image in each chapter sometimes fails to appear. If there's nothing up above, don't despair; you can still see the image [here](#)

Warren Commission Exhibit 388/Zapruder Frame 312 Comparison

While the early critics of the Warren Commission focused on discrediting the single-bullet theory, and using the location of the back wound on the clothing and face sheet to achieve this goal, by 1967 they'd begun questioning the official interpretations of the head wounds as well.

With perspective, it's easy to see that there was something suspicious about the head wounds from the get-go. To prepare for their testimony before the Warren Commission, the doctors who'd performed Kennedy's autopsy were asked to prepare drawings depicting the trajectory of the bullet through the President's skull. They did this by verbally describing the locations of the entrance and exit on the skull to medical illustrator Skip Rydberg, who then drew Kennedy bent over in the manner required so that his wounds could be connected by a straight line from above and behind. This drawing became Exhibit 388. What is wrong with this scenario is that the Warren Commission had blown up prints from the Zapruder film at their disposal, and Rydberg could have been given these in order to make his drawing as accurate as possible. Instead, the ever-wiley Arlen Specter, the Warren commission counsel leading this area of inquiry, flashed head autopsist Dr. James J. Humes the prints of Zapruder 312 and 313 in the middle of his testimony, after 388 was already entered into evidence, and asked him if the prints depicted Kennedy's head in "approximately the same position" as it had been in 388. To this, Dr. Humes replied "yes, sir." As if to drive home the Commission's lack of concern for accuracy, Commissioner Dulles continued in this vein moments later by asking Humes, who was never sworn in as a photographic expert, by the way, if the posture of Kennedy's head was "roughly the inclination that you think the President's head had at the time." To this, Humes repeated his response--"Yes, sir." Amazingly, there is no evidence anyone on the Commission thought to compare the drawing to the photos themselves.

The testimony of Dr. Pierre Finck was equally odd. As the wound ballistics expert on the autopsy team, his testimony was needed to shore up that the bullets came from above and behind. As the drawings presented by the doctors depicted the back wound much higher than the exit in the throat, it was not hard for him to say as much regarding those wounds. As the skull entrance was, by the doctors' own admission, lower than the exit at the top of the skull, however, there was no way he could reasonably assert that the fatal bullet would have to have come from above. When Finck testified that the exit wound was "so large that we can only give an approximate angle. In my opinion, the angle was within 45 degrees from the horizontal plane," Specter immediately saw that this opened the door for a shot from someplace other than the sniper's nest, even someplace on the ground. He immediately interjected "Is that to say that there was a 45 degree of declination from the point of origin..." to which Finck ultimately responded "I think I can only state, sir, that he was shot from above and behind." This echoed the autopsy protocol's over-zealous statement that "the projectiles were fired from a point behind and somewhat above the level of the deceased." On what purely medical basis could these claims be made? If one ignores the eyewitnesses, the Zapruder film, and the rifle found in the school book depository, none of which belonged in the testimony of a doctor unfamiliar with such evidence, there was no reason for Finck to say the fatal bullet came from above. That Finck himself was uncomfortable with his testimony on this point can be inferred from the fact his report to his superior officer General Blumberg stated simply "I testified that Kennedy was shot from behind."

But the lack of evidence indicating that the shot came from above didn't stop it from becoming part of the official myth, mind you, or the script repeated ad nauseum by Warren Commission defenders. In late 1966, as a response to Mark Lane's best seller *Rush to Judgment*, former Warren Commission Counsel Wesley J. Liebeler took to the lecture circuit. An October 19, 1966 article in the *L.A. Times*, however, suggests that, in defense of the Commission, Liebeler, a UCLA Law Professor, was willing to also assault the truth. Liebeler was reported to have told 650 students at a Stanford University law forum that "autopsy x-rays of assassinated President John F. Kennedy showed 'all shots' fired at him

were 'from behind and above.'" Well, if Liebeler actually said such a thing, he was full of malarkey. The x-rays gave no indication whatsoever that the shots were fired from above. No one testified to as much; in fact, Dr. Humes discussed a trail of fragments leading from low on the back of the head to high on the head, suggesting the exact opposite. So what was Liebeler talking about? Not only had the radiologist present at the autopsy, Dr. John Ebersole, not been asked to testify before the commission, but the doctors who were asked to testify were prevented from reviewing the x-rays beforehand. Such was the secrecy regarding these x-rays, in fact, that the doctors were not even allowed to study them while writing the autopsy report. By October, 1966, moreover, NO ONE had studied the x-rays beyond looking at them in hopes of finding missing bullet fragments. One can only conclude then that Liebeler was either grossly misquoted, or desperately making stuff up. I propose we suspect the latter.

But I digress. The point I've been trying to make is that, while few had questioned the Warren Commission's conclusions regarding the head wound prior to November 1966, it wasn't long before the former members and counsel of the commission felt the need to clarify and revise their findings. Researcher David Lifton had written an article, subsequently published in Ramparts Magazine in January 1967, expressing doubt that the descriptions of Kennedy's head wound made by those viewing him in Dallas--which placed the exit wound on the back of Kennedy's head--could "be reconciled with the findings of the Bethesda autopsy"--in which the bullet entered the back of his head, and exited from the top of his head. He had shared his reasons for coming to this doubt, moreover, with his college professor, former Warren Commission counsel J. Wesley Liebeler. This then led Liebeler to write an 11-16-66 letter to Warren Commission General Counsel J. Lee Rankin listing Lifton's reasons. Liebeler then mailed this letter to pretty much all the former counsel and members of the commission, along with a few other persons of interest, most significantly Acting Attorney General Ramsey Clark.

While Rankin ultimately responded to Liebeler, on 12-1-66, and made clear that no further investigation would be undertaken...by the former employees and members of the Warren Commission...it would be naive to accept that no response was forthcoming...by anyone.

Indeed, we should accept the opposite.

While the drawings created for the Warren Commission, consistent with Dr. Humes' testimony that skull fell to the table as he reflected Kennedy's scalp, depicted a large skull wound at the top of the head extending somewhat onto the back of the head, and while a report signed by Dr.s Humes, Boswell, and Finck in January 1967 confirmed the accuracy of these drawings, it wasn't long before someone decided something more supportive of Oswald's sole guilt, and more responsive to the points raised by Lifton, was needed. A May 29, 1967 memo written by Director of Public Information Cliff Sessions--outlining "talking points" that Dr. Humes should touch upon during his upcoming televised interview with Dan Rather--was sent to the Justice Department's Acting Assistant Attorney General Carl Eardley, and forwarded to Dr. Humes. Among these talking points was something new, that had not been previously touched upon; when asked about the bullets striking Kennedy, Dr. Humes was told to say that one of them "entered the back of the skull and exited through *the front*." The "front." The exit wound was no longer on the top of Kennedy's head, as depicted in CE 388, the drawing created for the Warren Commission under Dr. Humes' direction, but the "front" of the head. Dr. Humes was, in effect, being told to change his testimony.

So, did he follow his orders? You betcha. Loyal soldier to the end, when asked the location of the large exit wound by Rather, Dr. Humes said nothing about a wound on top of the head which could be an exit for a bullet entering from the rear *or the front*, and instead told the nation that the "exit wound was a large irregular wound to the *front* and side--right side of the President's head."

This verbal movement of the wound, however, proved too little, too late. With the publication of Josiah Thompson's Six Seconds in Dallas in late 1967, and its demonstration that the Zapruder film shows a

wound on the top of the head, and not the front of the head, as claimed by Dr. Humes months earlier, the problem with the bullet's trajectory reached an even greater audience.

There was an exhibit in Thompson's book that was particularly troubling. Thompson placed frame 312 of the Zapruder film, the last frame before Kennedy's skull exploded, on the same page with the Warren Commission exhibit depicting the supposed path of the bullet through Kennedy's skull, CE 388. The effect was devastating. From a comparison of these two images it was obvious that Dr. Humes' testimony was inaccurate, and that Kennedy's head was actually bent further forward in the drawing than in the film and that, when the drawing was corrected to the actual forward tilt of Kennedy's head, the path back from his exit wound through his entrance wound led to the rear trunk of the limousine, a long, long way from the supposed sniper's nest. This proved that either the bullet fired from above and striking Kennedy low in the back of his head suddenly and illogically exploded upwards, or that the entrance wound was not as reported.

This led the Justice Department, now functioning as a de facto cover-up department, to take even more drastic measures. Putting Dr. Humes on TV to tell the public what the government thought they should hear would clearly no longer suffice.

In late February 1968, even though it had been but a year since the autopsy doctors had signed a report saying the wounds in the autopsy photos confirmed the accuracy of the drawings they'd created for the Warren Commission, a four-man secret panel supposedly made of random experts but actually made of close colleagues (Dr. Alan Moritz had been a mentor to the panel's leader, Russell Fisher, at Harvard, and Dr.s Morgan and Carnes had been professors together at John Hopkins University) re-reviewed the photos and x-rays on behalf of Attorney General Ramsey Clark. This was supposedly done at the urging of the autopsy doctors themselves, but there is reason to doubt this is true. (Dr. Boswell's testimony before the ARRB suggests that he was, in fact, manipulated by Clark's assistant Carl Eardley--the same Carl Eardley who'd forwarded the "talking points" to Dr. Humes--into making this request).

This panel, commonly called the Clark Panel, then, not only made tremendous mistakes in its assessment of Kennedy's back wound location, which served to support the then-under-fire single-bullet theory, but also solved the problem of the head bullet's trajectory, by "finding" a wound of entrance high on the back of Kennedy's head that had apparently been missed by everyone who saw the President in Dallas and Bethesda, including the autopsy doctors. This new "find," moreover, made Thompson's comparison of CE 388 with Zapruder frame 312 irrelevant.

One might wish to think this a coincidence.

That this was not a coincidence was confirmed, moreover, by Clark panel ring-leader Russell S. Fisher when he told the Maryland State Medical Journal in March 1977 that Attorney General Ramsey Clark had seen the proofs of Six Seconds in Dallas, and that the Clark Panel report was released *"partly to refute some of the junk"* in the book. Apparently, their way of "refuting" Thompson's comparison of CE-388 and Z-312 was by confirming he was right and by declaring instead that their esteemed colleagues, Dr.s Humes, Boswell and Finck, were badly mistaken as to the actual location of the entrance wound on the back of Kennedy's skull, and were off by roughly 4 inches! Even more amazing, Fisher told the Maryland State Medical Journal that this was only a "minor error." What the??? One ponders what Fisher would consider a "major error" in such circumstances...

Or if he was just blowing smoke... When one considers that, in the March 13, 1970 edition of Medical World News, in which it was noted that the Clark Panel was convened "to allay public skepticism over the Warren Report," Fisher ran down a laundry list of excuses for the "errors" made at the autopsy, it seems likely he was more concerned about these "errors" than he would subsequently acknowledge.

These excuses, moreover, were not real excuses, but entirely false ones made up from either Fisher's incredible ignorance, or his fertile imagination. He told the medical world that, among the reasons for the "confusion" at the autopsy, were:

- *"The original x-rays and photos were not seen by the autopsy team in Washington or even by the Warren Commission until the time that our committee was convened..."* (While it's true the doctors were unable to look at the x-rays and photos while writing the autopsy report, they had inspected the x-rays and photos in November 1966 and January 1967, prior to the Clark Panel's inspection, and had publicly proclaimed that these inspections had confirmed both the findings of their report, and the testimony and exhibits provided the Warren Commission. As Warren Commission counsel Arlen Specter had similarly admitted in both U.S. News (in 1966) and the Saturday Evening Post (in 1967) to seeing a photo of Kennedy's back wound on the day of the assassination re-enactment, furthermore, Fisher was doubly in error.)
- *"skull fragments found on the street, which would have permitted a more accurate reconstruction of the skull and hence a clearer notion of the path of the bullet, were not seen by the Washington examiners..."* (This claim is equally bogus. The recovered skull fragments seen by Fisher were x-rays taken at the autopsy of fragments studied and handled by the doctors during the autopsy. It was beveling on the largest fragment, moreover, that convinced the autopsy doctors the bullet exited from the top of the head--the exact same conclusion reached by Fisher. While there were two fragments found in Dealey Plaza not returned in time for the autopsy, one being the Harper fragment, neither of these fragments were seen by the Clark Panel, and neither of these could have convinced the autopsy doctors a bullet entered high on the back of Kennedy's head, where Fisher claimed it had entered, as they'd both come from further forward on the skull.)
- *"for several hours the local coroner was not told that a tracheostomy had been performed at the place where one bullet emerged, and this helped to cloud the issue of how many bullets had been fired and from what direction."* (This claim is just strange. The confusion was not caused by the emergency room doctors' failure to tell Dallas coroner Earl Rose about the tracheostomy, but the autopsy doctors' failure to call the emergency room doctors prior to commencement of the autopsy, and the failure of anyone present at the autopsy to tell the autopsy doctors that, oh yeah, by the way, the emergency room doctors called a press conference this afternoon and told the world the president had a small bullet wound in his throat that appeared to be an entrance.)

In any event, the Clark Panel studied the medical evidence on February 26 and 27, 1968. Although their subsequent report would not be completed and signed by Drs Fisher, Morgan, Moritz, and Carnes until March 28, March 28, April 6, and April 9, 1968, respectively, Dr. Fisher admitted, in a March 4, 1970 letter to Harold Weisberg, that they'd actually "drafted" their report on February 27, and that the rest was just editing, and re-editing, and then mailing the report around and about to get signed. They never met, after February 27, to work on the report together.

Well, this suggests that they really studied the evidence ONCE, and only once, on February 26, without studying anything beyond the original autopsy protocol, and that February 27 was mostly taken up with the drafting of their report.

Now, note those dates. There is no record of which I am aware in which the planning for the Clark Panel's inspection is detailed. For all we know, it was put together in a hurry. It is undoubtedly intriguing then that on February 14, 1968--less than 2 weeks before the Clark Panel's inspection--Josiah Thompson's publisher, Bernard Geis, sent former Warren Commissioner John McCloy a copy of Thompson's *Six Seconds in Dallas*, along with some of the reviews it had garnered, and implored *"We earnestly hope that you will be moved to urge the formation of a Congressional body or an independent committee of scholars, critics, pathologists, and criminologists empowered to probe these hypotheses,*

refuting them if additional evidence warrants, or expanding upon the original report if that should prove necessary."

Hmmm. Did McCloy read the book, see its merits, and strong-arm Attorney General Ramsey Clark into setting up a secret panel to inspect the evidence, and *"refute some of the junk"* in the book? Was Fisher's claim Clark viewed the galleys of Thompson's book just a cover story put out by Clark? To hide that McCloy was really the one behind the inspection?

There is reason to believe so. Consider that barely a year before, McCloy had been asked by CBS to arrange an inspection of the evidence by the autopsists, and that he'd traveled to Washington that very day, and that an inspection had occurred within days.

Consider also McCloy's response to Geis' letter. Did he ignore it? No, not exactly. On July 15, 1969--almost a year-and-a-half later--he wrote Geis a letter saying he had *"not been impressed"* with the book's *"contents nor its conclusions."* He then sent this letter to Chief Justice Warren, asking for his input. Warren then responded by suggesting he not send the letter, as it could only be used to stir up controversy. The letter was not sent. (Geis' letter, and the letters of McCloy and Warren in response, can be found on researcher Denis Morrisette's website, jfkassassinationfiles.com.)

This raises a question, however. Why did McCloy wait so long to respond? Well, the thought occurs that he was waiting for something. Was he waiting for the public release of the Clark Panel's report, so he could cite it in his response? Perhaps.

Now, admittedly, this is a bit of a stretch... But it's undoubtedly of interest that, yes indeed, McCloy cited the Panel's report in his response. He wrote Geis *"The expert panel which examined the x-rays under the auspices of the Department of Justice last year clearly disprove the main Thompson contentions and certainly the original autopsy report even if it is somewhat less exacting and comprehensive than one might have wished it to be does so as well."*

Note that McCloy is deferential to the Clark Panel's report, yet somewhat critical of the original autopsy report. This suggests he knew the two reports were in conflict, a conflict un-reported in the press at the time. Hmmm... Had McCloy discussed the Panel's report with Clark? Or Fisher?

The timing of the report's release is also intriguing. It was released on January 16, 1969, just in time to throw a monkey wrench in Jim Garrison's trial of Clay Shaw. Garrison had been trying to gain access to the medical evidence for use in the trial, as he thought an independent study of the medical evidence by non-military medical experts might prove shots had been fired from multiple locations, and thus, more than one shooter. It appeared, moreover, that he was about to succeed in gaining access to these materials. This then led the Justice Department to offer up what could only have appeared to be a compromise--it would release an already-completed top secret study of the medical evidence by non-military medical experts--the Clark Panel's report from the year before.

That the timing of the release was no coincidence was confirmed, moreover, by Ramsey Clark himself. Within the HSCA's files is an outside contact report, summarizing a 5-6-78 phone call between Clark and an HSCA investigator. Well, it's right there in black and white--according to this summary, Clark admitted he was *"relieved"* when his *"experts corroborated"* the *"Warren Commission findings,"* but that he nevertheless *"delayed issuing"* their report, only to *"use"* the *"Garrison case"* as a *"vehicle"* for putting their report *"in the public record."*

And so it came to be: the January 16, 1969 release of the panel's report. The print media's ineptness and distaste for the whole matter is revealed in their headlines regarding the release of the panel's report, e.g. *"JFK Autopsy Facts Bared; Findings Claimed Correct;"* *"Autopsy Report Backs JFK Data."* I have yet to find one newspaper article about the release of this report to mention the amazing migration of the entrance wound on Kennedy's head.

This was apparently by design. In Harold Weisberg's 1975 book *Post Mortem*, he discusses the Clark Panel report in great detail, and re-prints a number of internal government memos he received in response to his many Freedom of Information Act lawsuits. One of these is a Jan 18, 1969 memo from Frank Wozencraft, of the Office of Legal Counsel, to archivist Marion Johnson of the National Archives. It is entitled "*Authentication of Autopsy Pictures*," and provides Johnson with a statement he is to give any member of the news media inquiring whether the photos and x-rays studied by the Clark Panel have been authenticated by the autopsists. The statement itself is not surprising, as it refers back to the November '66 inventory, and the signed statements by Humes, Boswell, Ebersole, and Stringer, that none of the photos or x-rays are missing. What is surprising, however, is the final paragraph, which reads:

"In addition, requests to see any documents which contain descriptions of the autopsy pictures should be denied on the ground that we agreed with Burke Marshall not to disclose such descriptions, for much the same reasons that the pictures themselves are not available for non-official access at this time."

This statement is quite interesting. There is nothing in the signed agreement between Burke Marshall, the Kennedy family's representative, and the government prohibiting the dissemination of *descriptions* of the autopsy photos. Such a provision, if actually considered, would have been of questionable legality anyhow. I mean, just think about it. Nellie Connally has testified to Mrs. Kennedy's holding President Kennedy's brains in her hands. Dr. Humes has testified to tearing Kennedy's skull apart in order to remove his brain. The autopsy report, in which the President's wounds are discussed in detail, has been part of the public record for years. So how can anyone justify withholding reports in which mere *photos* of the President's wounds are described?

They can't. So what was Wozencraft up to? Well, unfortunately the probability is that what he was up to was no good... Here, but a few days before the end of the Johnson Administration, is one of Johnson's top legal advisers pressuring the National Archives to withhold reports from the press in which the autopsy photos are discussed...under the guise that this would somehow be in poor taste. Never mind that these same legal advisers--the Office of Legal Counsel--have just released a new and improved report--the Clark Panel Report, in which these very photos are discussed in gruesome detail.

This, to me, is highly suspicious, and leads me to suspect that Wozencraft, and by extension the Johnson Administration Justice Department, were trying to keep from the press that the earlier descriptions of the photos both claimed a bullet entrance low on the back of the head was readily apparent...and that the Clark Panel reported no such wound, and was now claiming there was a wound high on the back of the head.

I mean, it seems more than a coincidence that, in the aforementioned 1970 article in *Medical World News*, neither Dr. Fisher, nor his fellow Clark panel member Dr. Moritz, mentioned their re-appraisal of the head wound location. Dr. Moritz's words, in fact, revealed a deliberate caution, as if he knew people would someday realize the location of the entrance wound on Kennedy's head had migrated, and didn't want them to think he was unaware of how disturbing this was. Here are his words: "*the findings of the Warren Commission are not inconsistent with the facts as presented to us.*" This is far from a ringing endorsement of the original autopsy report.

In any event, it was more than 3 years before the Clark Panel's drastic re-appraisal of the entrance wound location was reported. This second series of articles was written as a response to an address by Dr. Russell Morgan, the Clark Panel's radiologist, to a conference of fellow radiologists, and indirectly confirm the role of Thompson's book in the formation and conclusions of the panel. The articles below were found in the August 18, 1972 *Denver Post* and the August 19, 1972 *New Orleans States-Item*, respectively. This was but a few days before Dr. Cyril Wecht was to become the first Warren

Commission critic to view the autopsy materials. Perhaps Morgan wanted to lessen the impact should Wecht come out of the Archives and announce that the autopsy x-rays didn't show what the Clark Panel claimed, by putting on the record that they were over-developed and hard to read. Perhaps not. In a letter to researcher Harold Weisberg, Morgan claimed "I do not know why the press picked up my talk as a news item at this time. Apparently, they have nothing better to print."

(Sections indicating that Morgan in particular, and the Clark Panel in general, were far from unbiased in their analysis and had a clear-cut agenda to refute Thompson and derail Jim Garrison's trial of Clay Shaw are highlighted in **bold**.)

EXPERT AFFIRMS 1-BULLET VIEW

A radiologist who examined the X-rays of President Kennedy's fatal head wound said in Denver Friday they prove conclusively that only one bullet--fired from the sixth floor of the School Book Depository building in Dallas--caused his death.

Dr. Russell H. Morgan, dean of the medical school at John Hopkins University, said the films--could they be released by the Kennedy family--would effectively remove all doubt and controversy that the assassination may have been the result of shots from more than one direction.

However, because the films haven't been released for publication and because a report on their examination wasn't included in the Warren Commission study, the controversy has continued, Dr. Morgan said.

The medical school dean made his remarks in an interview prior to speaking to some 300 physicians, attending the 34th annual mid-summer meeting of the Rocky Mountain Radiological Society in the Brown Palace Hotel. The meeting, which began Thursday, continues through Saturday.

*Dr. Morgan was the only radiologist on a panel of four persons **asked by then Attorney Gen. Ramsey Clark to review the X rays because of controversies surrounding the autopsy report.***

But because the panel's report, released in April 1968, largely supported the conclusions of the Warren Report. Morgan said, it failed to receive much circulation. His talk here Friday on the subject was the first outside University organizations. The other members of the panel, all pathologists, have never spoken on the matter.

BULLET'S PATH

He said the X rays in conjunction with an analysis of the movie shot by amateur photographer Abraham Zapruder, show "rather conclusively" that the path of the fatal bullet--because the President's head was bowed and tilted to one side--was consistent with being fired from the sixth floor of the School Book Depository building.

***Further, he said, the X rays show the path of the bullet was strewn with thousands of bone fragments** and that no other bullets entered from either the right or left sides of the skull, as some critics of the Warren Report have maintained.*

Had other bullets entered the right or left side of the skull, they would have left paths of bone fragments, and no such paths were indicated. In addition, the entrance of a bullet is small, the exit point much larger, the doctor added, and both the entrance and the exit of the fatal bullet are characterized by this fact.

THEORY UNSUPPORTED

Morgan said his study of the X rays and the movie film also disprove the theory that another shot struck Kennedy from an overpass under which the president's car was preparing to pass.

The Zapruder film shows Kennedy's body lurching forward from one shot and then lurching backward, as though from a second.

Morgan said the backward lurch was a reflex action of Kennedy's shattered brain, which caused the president's muscles to tense, and react in a spasm. It was this sudden straightening of the body which was interpreted as being the result of a second shot, he declared.

The fatal bullet killed Kennedy instantly, Morgan said, and the subsequent emergency action at Parkland Memorial Hospital was in response to purely reflex activity.

ASSUMPTION CITED

Morgan speculated that the reason the X rays weren't included in the Warren Commission Report is that when doctors first examined Kennedy, they thought the bullet entered lower in Kennedy's head.

Had their assumption been correct, the bullet would have to have been fired from below the level of the presidential limousine, he said.

Morgan said the X rays can now be studied with permission of the Kennedy family, though the photographs of the injury, which he described as "pretty gory," are still closed to examination. He said he feels publication of the X rays has been prohibited because the Kennedy family equates them with the photographs.

SINGLE STUDENT

To date, he said, the X rays have been studied by only one person since being released for study last November, and that was by a urologist from Columbia University interested in the phenomenon of assassination.

Should the X rays ever be released for publication, he explained, great care and special techniques would be required before they would show the conclusive evidence, because they were produced in a hurry under extremely trying conditions and were over-exposed.

EXPERT SAYS 4-INCH ERROR LED TO FALSE SPECULATIONS IN JFK DEATH DENVER

(AP) — A leading medical expert says a four-inch mistake by a pathologist who examined the body of John F. Kennedy after he was shot to death in Dallas produced a series of false speculations about the assassination.

Dr. Russell H. Morgan said the bullet actually entered the president's skull some four inches higher than initially reported, but the Warren Commission's detailed report on the assassination failed to clarify this point.

Morgan, dean of the medical school at Johns Hopkins University, is the only radiologist to examine the X-ray photographs of the slain president's skull.

The matter became an issue of great importance in New Orleans between 1967 and 1969 when Dist. Atty. Jim Garrison was attempting to prove that the slaying of Kennedy was plotted here.

Garrison contended that Kennedy was shot from the front, rather than from behind as the Warren Report concluded, and that the X-rays would prove it. He made many legal attempts to gain access to the X-rays examined by Dr. Morgan, but failed.

The D.A.'s probe died after Clay L. Shaw was acquitted March 1, 1969, of charges of conspiring to kill the president, though legal maneuvering continued long after that and only recently did the U.S. Supreme Court uphold an injunction prohibiting further prosecution of Shaw by Garrison.

In an address to the 34th midsummer conference of the Rocky Mountain Radiological Society here, he gave X-rays the credit for finally revealing the pathologist's error and disproving many of the more extreme speculations spawned by the mistake, which is included in the Warren Commission report.

Morgan's four-year investigation of the photographs and the Abraham Zapruder film of the assassination led him to several conclusions, he said.

The most important finding was that one of the pathologists who examined Kennedy's body in Washington the night of the assassination erred in saying the fatal bullet entered the "occipital protuberance," or the bulge at the lower section of the back of the skull.

This statement, which Morgan said later proved to be false, was included in the Warren report. Critics of the report immediately noted a major inconsistency between that alleged entry point and several features of the Zapruder film which showed a frame-by-frame sequence of the shooting. Critics said the film showed the president's head in a near vertical position when the bullet hit and also showed him lurching backward, leading to speculation the bullet came from the front.

The angle of the bullet became controversial. Some contended it couldn't have been fired from Lee Harvey Oswald's rifle in the sixth floor of the Texas School Book Depository and entered the skull where the pathologist said it did.

Morgan said Friday the Warren Commission, which named Oswald as the assassin, made no effort to explain the contradiction, allowing it to provide controversy for several years.

When he was given two days to examine the X-ray photographs, Morgan found them of poor quality, severely over-exposed. Of the 14, he said, only three were of the head wound. He said one had pencil marks on the negative itself showing "where somebody thought the bullet had gone."

(The remaining paragraphs were found in the version of the article published by the Galveston Daily News the next day.)

The penciled line corresponded to the mistaken pathologists' conclusion that the bullet entered the base of the skull and exited at an upward angle out of the right of the forehead. But Morgan said he found the actual entry wound was 120 millimeters away from the penciled line, more than four inches higher on the back of the head.

The lurching of the president's body backward, he said, was caused by body spasms after the massive wound was inflicted.

Morgan said the Zapruder film, the ballistics tests, the projected line of fire and the angle of entry of the fatal bullet all were consistent with the explanation that a single shot fired from above and behind killed the president.

"The Warren Commission's diagnosis was correct," he, said, "even though the evidence cited was inconsistent."

Wounds of Contention

- An over-view of the President's ever-changing wounds. Significant changes highlighted. Measurements are recorded width by length.
- **The entrance wound in the back**
- 1963, the Autopsy: 7 mm x 4 mm, 14 cm in from a point on his right shoulder, 14 cm below the back of his head. Determined by insertion of finger to lead sharply downwards, at approximately a 45 degree angle.
- 1968, the Clark Panel: 7 mm by **10 mm**, 15 cm in from a point on his right shoulder, 5 cm to the right of his midline, 14 cm below the back of his head, 5.5 cm below a fold of skin on the back of his neck. With an abrasion collar on the upper and outer margins, indicating the bullet headed downwards.
- 1978: the HSCA Forensic Pathology Panel: 9 mm by 9 mm (measured against the photograph and not against the body), 4-.5 cm to the right of his midline (as per the HSCA trajectory analysis), 13.5 cm below the back of his head, 6 cm below the most prominent neck crease, 5 cm below the upper shoulder margin. (The trajectory analysis decided it was only 4 cm below the shoulder margin.) With an abrasion collar running from **1 o'clock to 7 o'clock**, and the lower margin abraded in an upward direction, indicating the bullet traveled slightly **upwards** upon entrance. (The trajectory analysis, after making adjustments for Kennedy's body position at Zapruder frame 190, decided the bullet traveled slightly downwards.)
- **The wound in the throat, believed to be of exit**
- 1963, the Autopsy: a few millimeters in diameter, or 3-5 mm (based on Dr. Humes' phone call to Dr. Perry the day after the autopsy and Dr. Perry's testimony), in midline or slightly right of midline (based on the testimony of Dr. Perry and Dr. Carrico), at the third or fourth tracheal ring (based on the location of the tracheotomy incision as reported by Dr. Humes.)
- 1968, the Clark Panel: no size given, no right to left location given, upper half of circumference **above** the tracheotomy incision, **9 cm below** the fold of skin on the back of his neck (which places the wound **3.5 cm below the back wound**).
- 1978, the HSCA Forensic Pathology Panel: **6-7 mm** (based on Dr. Perry's discussion with the Committee), **2.5-5 mm to the left** of midline (as per the HSCA trajectory analysis), lower half of circumference **below** the tracheotomy incision, (which is measured at 1.5 - 2 cm in vertical diameter, thereby **dropping** the wound **1.5-2 cm below** the site measured by the Clark Panel), **4 cm below** the shoulder line, which places the wound **1 cm above the back wound**, (the trajectory analysis says it was even with the back wound before making the adjustments for body position and 1.1 cm below it after the adjustments.)
- **The entrance wound in the back of the head**
- 1963, the Autopsy: 15 mm by 6 mm, 2.5 cm to the right and slightly above the bony protuberance on the back of his head or EOP.
- 1968, the Clark Panel: **6 mm by 15 mm**, 2.5 cm to the right and **10 cm above** the EOP.
- 1978: the HSCA Forensic Pathology Panel: **9 mm by 15-20 mm**, 1.8 cm to the right (as per the HSCA trajectory analysis) and 10 cm above the EOP (9 cm according to the trajectory analysis).
- **The large wound of exit above and in front of the ear**
- 1963, the Autopsy: 13 cm at greatest diameter (10 cm by 17 cm according to Boswell's drawing), involving chiefly parietal bone. (Measurements taken after reflection of the scalp.) No beveled exit apparent on the skull, only on a recovered bone fragment.
- 1968, the Clark Panel: massive fragmentation stretching from 25 mm past midline in the left parietal bone all the way into the right temporal bone (description based upon x-rays taken before reflection of scalp).
- 1978, the HSCA Forensic Pathology Panel: no measurement given for large defect. 2.5 cm exit for bullet itself approximated from study of largest recovered fragment. **Beveled semi-circular exit in the fronto-parietal region** of the skull is noted as well as on the largest fragment.
- **Is it just me or is something really wrong here?**

Wounds of Contention

Such was the Justice Department's own skepticism of the Clark Panel's conclusions, however, that Carl Eardley, who'd been working with the doctors on their reviews and reports for years, and who'd been one of the driving forces behind the Clark Panel, asked Dr. Boswell to participate in the autopsy of Dr. Martin Luther King. This was April 4, 1968, but 5 weeks after the Clark Panel had viewed the autopsy materials, and had questioned the competence of Boswell and his colleagues. Boswell, to his credit, refused. While one could make the argument that Eardley remained ignorant of the Clark Panel's findings until after it had been written up, reviewed, and signed, and that the last signature on the report was dated April 9, that still doesn't explain why Boswell's equally discredited colleague Dr. Finck was allowed to participate in the autopsy of Senator Robert F. Kennedy two months later, with no objection from the Justice Department. This also fails to explain why, even after the release of the panel's report, both Finck and Boswell were asked to help the government in the defense of Clay Shaw, and defend the Clark Panel's findings. Unless the government failed to fully trust the Clark Panel, there is a huge question as to why the government would continue to use Boswell and Finck as experts long after the Panel, in an official government report prepared on behalf of the Attorney General, had made them out to be total incompetents. For how else can one describe a doctor who mistakenly records a head wound high on the back of a man's skull as low on the back of his skull, creates a face sheet and autopsy protocol affirming this location, and then confirms this location again after reviewing the man's

autopsy photos...TWICE?

The possibility that Eardley and the Justice Department thought the autopsy doctors competent, but grossly mistaken on the location of the entrance into the skull, simply makes no sense in light of the doctor's subsequent reports claiming the autopsy photos supported their original findings. That is...unless...Eardley knew the subsequent reports were created for political reasons and not to be taken seriously. Hmmm...

An article in the 2-24-69 Manchester Union Leader helps shed some light on Eardley's mindset. The article reports that, while representing the government (in a hearing regarding Jim Garrison's quest to gain access to the autopsy materials), in which Dr. Cyril Wecht used the conclusions in the recently released Clark Panel report to question the competence of the original autopsists, Eardley snapped. He reportedly challenged Wecht: *"But you weren't at the autopsy, were you? Have you ever attended the autopsy of a famous person like the President? You never have been surrounded by Treasury Agents, FBI agents, Admirals, and doctors, all asking to have this thing over with? It makes a difference, doesn't it?"*

I'll give you a second to get over that one. Yep, the Justice Department, which from 1963-1969--the entire span of Lyndon Johnson's presidency--had insisted that Kennedy had received both an adequate and accurate autopsy, IMMEDIATELY changed tone after Johnson left office, and began touting that not only had the original autopsists made mistakes, but that these mistakes WERE NOT THEIR FAULT, but the fault of the Johnson Administration, which had failed to ensure the doctors were allowed the peace, quiet, and solitude necessary to distinguish a bullet entrance near the top of the head from one four inches away. What nonsense!!!

Of course, the Justice Department was not alone in pretending that one could both claim the original autopsy was authoritative and that the head wound location was incorrectly recorded, and off by four inches. They had plenty of support from an unsurprising source...former counsel for the Warren Commission. In May 1975, former Warren Commission counsel W. David Slawson and Richard M. Mosk wrote an article for the L.A. Times arguing that any re-investigation of the assassination be restricted to the behavior of the FBI and CIA, and that there was no need to re-investigate the actual crime. This was a flip from Slawson's position in 1966 that a re-investigation of the medical evidence could prevent an investigation of the behavior of the FBI and CIA. Anyhow, in this article the dynamic duo made the amazing claim that "The evidence concerning the wounds conclusively dispels the idea of shots from the front...The wounds both slanted downward from Kennedy's back. This is clear beyond doubt from the autopsy and from the photographs and X rays of the body...to doubt the evidence of the wounds is to label as liars the doctors who examined the body, the pictures and the X rays for the commission."

Well, this was more disgusting nonsense. Pure horseshit... 1) The wounds did not both slant downward. The head wound, as originally interpreted, slanted upward. The wound was then re-interpreted, and re-located, so that the wound could slant downward. 2) Claiming that doubting the medical evidence is to label the autopsy doctors "liars" is hypocrisy at its worst. Did Slawson and Mosk forget that the government itself doubted the interpretations of the autopsy doctors, and embraced a review of their work in which it was declared they'd incorrectly recorded and remembered the location of the fatal head wound? If not, then why did they not only not denounce this outrage, but embrace the review themselves, by claiming the head wound slanted downward? 3) Slawson and Mosk knew DAMN WELL that the doctors were forbidden from examining the body, pictures and X rays for the commission, and their pretending they were not is offensive. No, more than offensive. The rapid fire assault on the truth by these men is so brazen, in fact, that their own words label themselves as "liars" and hypocrites, for then and evermore.

And they were far from alone... A June 2, 1975 article in Medical World News on the Rockefeller Commission Panel included a few choice quotes from Dr. Fisher. On the possibility congress would open its own investigation of the assassination, and conduct a thorough re-examination of the medical evidence, he whined: *"I think it would be a waste of time and taxpayers' money...And it implies that people who did previous work were dishonest."* Wow. What a freakin' hypocrite! He had no problem second-guessing the autopsy doctors, and re-interpreting the location of the entrance wound on Kennedy's head, but felt insulted congress might not just take his word on it.

His campaign dragged on for years. The March 1977 article on Fisher in the Maryland State Medical Journal and a March 22 1977 article on Dr. Lattimer carried by the Ridder News Service revealed that although they each had come to conclusions contrary to those of the autopsy doctors while performing their own limited examinations of the medical evidence, they felt no further investigation was necessary. Even more disturbing, a September 17, 1977 article distributed by UPI reported that Dr. Russell Morgan had just spoken at Michigan State University, and had told reporters that "Mr. Kennedy's X-rays showed conclusively that a single-bullet fired from behind was the cause of death" and that "Congressional investigators should concentrate on other elements in their inquiry into the assassination."

Well, this is quite interesting. The last time Dr. Morgan had been quoted in the press about the assassination was but days before Dr. Cyril Wecht was to become the first non-government-affiliated pathologist to view the assassination materials at the archives, and in effect review his findings. And now, but 6 days before 6 members of the HSCA pathology panel were to review his findings, on behalf the government, no less, he re-appears, urging that no re-investigation be conducted. Should everyone to look at the autopsy materials in between these two appearances have confirmed his findings, that would be one thing...but in 1975, Dr. Fred Hodges, a Professor of Radiology at the John Hopkins School of Medicine, where Morgan served as Dean, was asked to study Kennedy's X-rays on behalf the Rockefeller Commission, and had provided them a report which directly contradicted Morgan's re-interpretation of the head wound location. Yes, in a little discussed report long withheld from the public, in a passage rarely if ever quoted before I started broadcasting it all over the internet, Hodges refuted the findings of the Clark Panel, noting instead that "a small round hole visible from the intracranial side after the brain was removed is described in the autopsy report in the right occipital bone, and many of the linear fracture lines converge on the described site." Even worse, for Morgan, was the next line: *"The appearance is in keeping with the colored photographs showing a large, compound, comminuted injury in the right frontal region, and a small round soft tissue wound in the occipital region."* Morgan, of course, had claimed there was no wound in the occipital bone on the X-rays or photographs, and had pushed the Clark Panel into concluding the wound was actually four inches or more higher on the back of Kennedy's skull, in the parietal bone.

Hodges' then still-secret report was thus bad news for Morgan. And seeing as Morgan was Hodges' boss, it was bad news that Morgan would almost certainly have discovered. It follows then that Morgan's urging congressional investigators to forget about the X-rays and focus on other matters may not have been so innocent, and was instead a plea designed to protect his own reputation. While this might seem a little harsh, let's remember Morgan's viewpoint but five years earlier. While he once was reportedly of the opinion that the X-rays were *"produced in a hurry under extremely trying conditions"* and were of *"poor quality"* and *"severely over-exposed,"* and that *"great care and special techniques would be required before they would show the conclusive evidence,"* he now claimed they *"showed conclusively that a single-bullet fired from behind was the cause of death"* and that no further investigation was necessary. Perhaps he'd simply changed his mind and no longer felt the cowlick entrance he'd thought he'd "discovered" was a necessary ingredient to the single-assassin conclusion, and worth verifying. Or perhaps he simply didn't care if Kennedy was killed by a conspiracy or not, as

long as his own reputation was protected.

While one might assume from all this that Morgan and the Clark Panel, in their zeal to refute Thompson, had made a mistake in moving the head wound, the HSCA pathology panel, which corrected the Clark Panel's misrepresentation of the back wound when compared to the neck wound, nevertheless confirmed the Clark Panel's new and improved location for the head wound.

This amazing migration is still much-discussed among students of the assassination...and largely ignored by most everyone else. Vincent Bugliosi, in his monster tome *Reclaiming History*, repeats without comment the claim by Dr. Werner Spitz, a colleague of Dr. Fisher's who served on both the Rockefeller and House Select Committee panels, that *"It's just a red herring. We know from the autopsy photos and X-rays that there was only one entrance wound to the back of the president's head. The only significance this matter has is academic. If the bullet had entered where the autopsy surgeons said it did—and we know from the photos and X-rays they were wrong—it would have been an unusual deflection for the bullet to have exited where it did. This was a military-type bullet and it is unlikely that it would be deflected so sharply upwards."* That Bugliosi—who prides himself on his cool-headed logic—lets Spitz get away with such nonsense is embarrassing. I mean, shouldn't he have noticed that Spitz, as Fisher and the Clark Panel before him, was working backwards—that his conclusion that the trajectory for a single bullet entering low on the head and exiting high on the head didn't work had led him to believe the bullet must have entered higher on the head, and reject the statements of everyone who'd actually seen the entrance? I mean, really, is it actually possible Bugliosi thinks such a massive dispute over the president's wound locations is merely "academic"?

I suspect not. It follows then that he was blowing smoke at his readers in his lawyerly manner and hoping they wouldn't notice that "Hey, something's wrong here!"

But at least Bugliosi talked to a doctor before claiming the migration was meaningless. In 2006, former detective Mark Fuhrman wrote a much-publicized book, *A Simple Act of Murder*, in which he investigated and dismissed the single-bullet theory using arguments similar to those provided in the previous chapters. He concluded, nevertheless, that Oswald acted alone. While barely dealing with the head wounds, Fuhrman mentioned in passing that the HSCA forensic medical panel, after viewing the autopsy photos and x-rays, concluded that the entrance wound on Kennedy's skull was *"four inches higher than originally believed by the Warren Commission."* In what has become a typical gesture among those claiming Oswald acted alone, however, he made up an excuse for this, and claimed that the Warren Commission had not actually seen the autopsy materials. This, of course, was nonsense. Not only had Justice Warren admitted viewing the materials, but the autopsy doctors had twice viewed the materials and confirmed the entrance wound location prior to Morgan and the Clark Panel's re-interpreting the wound location. Fuhrman's treatment of the head wounds was thus shallow and deceptive.

Which was pretty much par for the course...

HSCA Ida Dox Drawings

Form: 12.—Drawing depicting the posterior head wound. Note also the position "white mass," described later.

Above: HSCA Fig. 13

Right: HSCA Exhibit F-66

HSCA Ida Dox Drawings

With the re-opening of the investigation by the HSCA, there was great optimism that this time the medical experts would get things right and not present the American people with anything as misleading as the Rydberg drawings. But this was not to be. When one compares the HSCA's drawings of the damage to the President's skull with the HSCA's drawing of the back of the President's head taken from what is purported to be an actual autopsy photo, it is easy to discern that something is wrong. While the first depicts an explosion of bone fragments from the back of the head, the drawing from the autopsy photo depicts this portion of the head as intact, with the only area missing bone a line of fracture from the top of the President's head down towards his right temple. While the argument could be made that the first drawing depicted bones from the back of the head blown out of the hole by the temple, the testimony of the autopsy surgeons reflected that the skull high on the back of the head near the new Clark Panel-determined in-shoot, although badly fractured, remained beneath the scalp. It makes little sense then that the skull fragments exploding from just in front of the entrance in the cowlick in the first drawing represent fragments which the second drawing demonstrates came from the front half of Kennedy's skull. That the drawing depicting the fragments fails to depict the blown-out "wing" of bone near Kennedy's temple, which is clearly evident on the autopsy drawing, is yet further testament to its inaccuracy.

So how did this inaccurate drawing come to be? Helpfully, HSCA medical illustrator Ida Dox testified "a skull was used that had the dimensions of the President's and the photographs of the retrieved bone fragments were traced to get the outline. This paper was cut out along the outline and taped on the skull in the position that the x-rays indicated there was bone missing, and from this paper and skull

reconstruction I made my drawing.” Sounds pretty scientific. Unfortunately, the aforementioned x-rays in fact showed there was plenty of skull left towards the back of the head, and that the recovered fragments must have come from somewhere closer to the wound of exit near the President’s right ear.

This is no simple mistake, mind you. This is a real whopper. From this one can only conclude that the HSCA medical panel, and its chief spokesman Dr. Michael Baden, were fairly clueless, that they were deliberately trying to deceive, or that they were both fairly clueless and deliberately trying to deceive.

I'm leaning to the last one.

While it’s true that soft-nosed bullets are designed to gradually peel back as the bullet traverses flesh, as this gives the bullet more stopping power, full metal jacket bullets like the ones purportedly fired from Oswald’s rifle are designed not to break-up at all. As a result, it takes a tremendous impact to break-up such a bullet. The bullet striking Kennedy was shattered and scattered. While Warren Commission defenders have argued that this break-up could have occurred as the bullet crossed the brain, they usually ignore the fact that no wound track connecting the entrance wound and exit wounds cited at autopsy could be identified within the brain, and that the bullet fragments supposedly marking the Warren Commission's proposed path from the entrance observed at autopsy to the large defect presumably of exit were later revealed to have been inches above this trajectory.

This "mistake" on the part of the autopsists, furthermore, was a major factor in the HSCA's rubber-stamping of the Clark Panel conclusions.

When discussing why his panel had rejected the findings of the autopsists, who'd actually seen Kennedy's body, on the location of the entrance wound on the skull, Dr. Baden explained: *"In discussions with the three doctors and looking together at the same photographs, the doctors who did the autopsy feel that what we identify as an entry wound is an artifact, perhaps dried blood, and not a perforation. I think that the committee will have opportunity to hear testimony from Dr. Humes, who did perform the autopsy, later today, and he can give you his reasoning. We, as the panel members, do feel after close examination of the negatives and photographs under magnification of that higher perforation, that it is unquestionably a perforation of entrance; and we feel very strongly, and this is unanimous, all nine members, that X-rays clearly show the entrance perforation in the skull to be immediately beneath this perforation in the upper scalp skin; and further, **although the original examination of the brain was not complete, photographs of the brain were examined by the panel members, and do show the injury to the brain itself is on the top portion of the brain. The bottom portion or undersurface of the brain, which would have had to have been injured if the bullet perforated in the lower area as indicated in the autopsy report, was intact. If a bullet entered in this lower area, the cerebellum portion of the brain would have had to be injured and it was not injured. So that is the basis for what remains a disagreement between our panel and the original autopsy doctors.**"*

The panel's unanimous conclusion, moreover, was echoed by the Committee's wound ballistics expert, Larry Sturdivan. When shown the skull x-rays, and asked to comment on the location of the wound track, Sturdivan testified: *"There is extensive deformation at the top of the skull which indicates that the radial velocity that was imparted to the tissue, broke it open and, therefore, relieved the pressure at the top, well, either to the right or the left, since you can't distinguish on an X-ray. You would presume, then, that the soft tissue, which was badly damaged, would have moved somewhat in the direction of that relieved pressure and, therefore, would be displaced somewhat upward from the original track. So, I would place the original track as being somewhat lower than that trail of fragments indicated through there; certainly not much lower...**there is no indication of any track in the lower half of the skull. It definitely was in the upper part.**"*

Well, this pretty much destroys the bullet trajectory as outlined by the Warren Commission, and

suggests that the Clark Panel and HSCA were correct in searching for another entrance. The controversy can then be concluded in their favor. Right?

Well, not so fast... Unfortunately, there are problems with their proposed location as well. Since the damage to the upper brain started just left of the newfound entrance in the cowlick and led straight across the skull to the forehead, and since the expected trajectory through Kennedy would have been an ever-widening cone of fragments centered around an outshoot above the temple, the HSCA Forensic Pathology Panel should have suspected that something was not quite right. I mean, why didn't any of the fragments from this ever-widening cone embed within the brain on a level *below* the trajectory from the sniper's nest?

There is reason to suspect someone asked this question. And found no answer. It seems more than a coincidence that not one HSCA exhibit depicts the break-up of the bullet as it traversed the skull from its entrance near the cowlick. Curiously, the drawings used by the HSCA to depict beveling on the skull, the analysis of which led both the autopsy doctors and the HSCA to conclude the fatal bullet was fired from behind, depicted an intact bullet like those used in Oswald's rifle entering and exiting a skull, even though, according to the HSCA's own findings, this could not possibly have happened. This is undoubtedly confusing.

There is reason to suspect, then, that Exhibit F-66, made to the specifications of Dr. Michael Baden, was a deliberate deception. But what about the tracing of the autopsy photo? Was that a deception as well?

Now You See It! Now You Don't!

A comparison of the HSCA's proposed entrance in the autopsy photo (at left, and above) and the HSCA's tracing of this photo, HSCA Figure 13 (at right and below), shows that some detail was added by the illustrator to make it look more like an entrance.

So why was detail removed from the round-shape observed in the blow-up at left (at the 1 o'clock position to the white matter observed near the hairline)? This was the exact location of the entrance observed at autopsy. Was it made to disappear?

Now You See it! Now You Don't!

When the HSCA forensic pathology panel showed Dr. James Humes a photo displaying what they believed was the actual entrance hole on the back of the head, the small oval shape in the cowlick, Dr. Humes, who'd led the autopsy of President Kennedy and had repeatedly asserted that the hole was near the President's hairline, responded "I don't know what that is. Number one, I can assure you that as we reflected the scalp to get to this point, there was no defect corresponding to this in the skull at any point. I don't know what that is. It could be to me clotted blood...it certainly was not any wound of entrance." While Dr. Humes' irritation was spurred no doubt by the Clark Panel's decision to change the location of the entrance hole, when one compares the HSCA drawing of the autopsy photo to the original autopsy photo, there's reason for us all to be irritated, even outraged.

One source of anger comes from looking at the mark in the cowlick, which was repeatedly re-drawn to look more like a bullet entrance by medical artist Ida Dox, at the request of pathology panel spokesman Dr. Michael Baden. At Cyril Wecht's 2003 conference on the assassination, Dr. Randy Robertson showed the audience a 5-9-78 memo from Baden to Dox found in the National Archives. This memo was a photocopy of a page from Dr. Spitz's book *Medicolegal Investigation of Death*, with a drawing of a typical entrance wound. Beside the drawing, Dr. Baden had written "Ida, you can do much better."

Apparently, Dox's early versions of the "bullet hole" were still too close to the original photo, and made the "bullet hole" appear more like the "clotted blood" Dr. Humes described, than the bullet hole Dr. Baden wanted to be there.

This proved to be a big problem..for Humes. In 1996 HSCA counsel Andy Purdy told the ARRB that after Humes made his comments, Dr. Charles Petty took Humes outside and yelled at him. And this wasn't just Purdy's fantasy. In a 2-20-2000 meeting with researchers, Dr. Michael Baden not only confirmed Purdy's story, but built upon it. He re-constructed Petty's words to Humes for dramatic effect, and had Petty call Humes a "God-damned jackass."

And Humes' problems extended way beyond his being yelled at by Petty. His subsequent problems would, in fact, make those problems look--eegads--petty in comparison. In his 1998 book *Real Answers*, HSCA Counsel Gary Cornwell admits that, as a result of Humes' failure to agree with the new and improved entrance location, he was all set to treat Humes as a hostile witness and aggressively question him about the problems with the autopsy during his September 1978 testimony before the committee. (Cornwell believed that Humes, *"in an apparent attempt to cover up his own mistakes"* had *"not told the truth"* to the Warren Commission, and that he--Cornwell--could *"prove it"*.) Cornwell then explains that his plans were thwarted after the *"committee's doctor"* (most probably Dr. Baden, but possibly a reference to Petty) went behind his back, and warned Humes of Cornwell's plans, essentially telling Humes that if Humes agreed to pretend the entrance wound was in the cowlick he could survive Cornwell's questioning with his reputation intact.

Baden's plan was successful. A year after Dr. Humes called the supposed entrance in the cowlick "clotted blood" he testified that he had been mistaken and that he now thought it was the entrance wound described in the autopsy report.

But this wasn't the end to Humes' humiliation. In what may have been an attempt to hide Humes' description of the supposed wound in the cowlick as "clotted blood," the report of the HSCA forensic pathology panel, in its discussion of the controversy over the wound location, noted that, when discussing the proposed cowlick entrance, "Dr. Humes first suggested that it might represent an extension of a more anterior scalp laceration, incident to the exit wound, in spite of the fact that within the photograph the margins of the wound appear to be intact around the entire circumference." Well, this, as we've seen, is not true. It was, in fact, Dr. Boswell who said it could have been the end of a scalp laceration, and not Humes. Still, this may have been an innocent mistake.

But then again, perhaps not. When the panel was working on its report, they may very well have been under the assumption their interview with Humes and Boswell would be locked up for 50 years, a la their interviews with their colleagues Finck and Ebersole. As a result, their attributing an easily disproved theory to Humes may not have been an innocent mistake at all, but a conscious decision to damage his credibility, and hide his initial objections to their dubious re-interpretation of the entrance wound.

That Humes was not pleased with this, and was pressured into acting as though he'd changed his mind, when he never really had, is supported, moreover, by the strange fact that in 1992, when he next spoke of the entrance wound location on Kennedy's skull, he'd "changed" his mind back.

No one else claiming to have seen the entry wound even pretended to change their minds. Humes' colleague from the autopsy, Dr. Boswell, never wavered in his recollection of the entrance location being in the area of the brain matter low on the skull. Not surprisingly, he was never called before the committee. The third autopsist, Dr. Finck, was interviewed by the medical panel on March 11 and 12, 1978 and put under tremendous pressure to change his interpretation of the entrance wound's location and agree with the panel that the real wound was in the cowlick. Apparently they felt that Finck, as a forensic pathologist, would be more understanding of their plight, and more agreeable to their points of

view.

They were, as it turned out, barking up the wrong tree. Finck had been consistent in his previous statements, in that he'd always said he'd arrived after Kennedy's brain had been removed, and that he'd soon thereafter examined a 15 by 6 entrance wound low on the intact skull. Well, think about it. How could a wound in the location of the red spot in the cowlick still be on the skull AFTER the brain had been removed? And how could Fink suddenly turn around and say "Oh yeah, the wound I thought I saw on the skull was really on a piece of bone removed by Dr. Humes"? Finck's previous statements and the pathology panel's contention the wound was in the cowlick were thus hopelessly at odds.

In any event, in a section of the pathology panel's interview of Dr. Finck (conveniently excluded from the official transcript, and found only on the tape), Dr. Weston kept asking Finck if it was possible there'd been some sort of transcription error when the autopsists reported that the wound was near the EOP. Finck admitted that yes, it was possible. Dr. Baden then pounced and told Finck that the wound in the cowlick in the photos was determined to be 15 mm by 6 mm--the same size of the wound measured at autopsy. He also told Finck that the x-rays showed an entrance wound exactly where the mark is in the cowlick. (Neither of these assertions was true or repeated in the the panel's final report.) Baden then remarked that everything mentioned in the autopsy report pointed to the wound being in the cowlick. (This is absolute nonsense.) At this point, Dr. Wecht and Dr. Petty disavowed Weston's and Baden's "cross-examination" and "badgering" of Finck. Ultimately, Finck held firm and said he believed the wound was as measured at autopsy, and beneath the white gob of matter in the autopsy photos. No surprise, he was also never called before the committee.

And the HSCA staff's treatment of the other autopsy witnesses wasn't much better. Dr. David Osborne, Bethesda's Chief of Surgery, who would later become an Admiral, was yet another autopsy witness to claim he saw the "low" entrance wound. His presence at the autopsy is confirmed by the FBI's report on the autopsy, and his assistance in closing the head wounds after the autopsy is confirmed by the testimony of Dr. Humes before the ARRB. Osborne was interviewed by HSCA staff member Mark Flanagan on June 20, 1978, two months after the HSCA medical panel interviewed Dr. Finck and found itself at an impasse regarding the location of the entrance wound on Kennedy's head. To repeat--those present at the autopsy insisted this wound was near the EOP low on the head, while the members of its medical panel were pushing that it was really in the cowlick near the top of the head. And yet, amazingly, Flanagan's report on his discussion with Dr. Osborne never mentions any discussion of the precise wound location, and instead relates that "Osborne said that there was no question that the bullet entered the back of the head and blew off the top of the head." Well, this was chickenshit, at best. If Osborne had said his colleagues were in error, and that the bullet entered near the top of the head, why not say so? And if he supported his colleagues, and claimed the bullet entered low on the head--in opposition to what the medical panel was preparing to claim in its report--well, why not say so? Unless, of course, someone had already decided to downplay all support for the statements of Humes, Boswell, and Finck, and had already decided to hang them out to dry and claim they'd been mistaken. In any event, a researcher named Joanne Braun was able to get Osborne's recollections on paper, and he told her in a 4-5-90 letter that a bullet "hit in the occipital region of the posterior skull which blew off the posterior top of the skull." He had thereby supported the original recollections of his close friend, Dr. Humes. Osborne, as you've probably guessed, was never called before the House committee.

Autopsy photographer John Stringer, and Secret Service Agent Roy Kellerman also claimed to see a small entrance wound low on Kennedy's skull, and were similarly brushed aside. This means that Dr. Humes was the ONLY autopsy witness or participant to say the cowlick mark in the photos was the entrance wound, and he said so exactly ONCE, while under duress, in the ONLY testimony of an autopsy witness before the committee, and retracted it afterward.

Of course, that doesn't stop the most ardent single-assassin theorists from trying to claim otherwise. In

his 1993 book *Case Closed*, single-assassin theorist Gerald Posner claimed he'd spoken to both Dr. Humes and Dr. Boswell, and that they'd both told him the HSCA had convinced them they were mistaken in their original identification of the wound location, and that they both now believed it had been 10 cm above the EOP, in the cowlick. They both denied this, of course. But the damage had already been done. In a March 1993 article published in the *Journal of the American Medical Association*, Dr. Robert Artwohl, while trying to refute the claims of conspiracy theorists angry over the magazine's recent articles supportive of Dr.s Humes, Boswell, and Finck, exposed his true agenda by first admitting that "for a bullet to enter just above the EOP and exit the right frontotemporoparietal area, it would have had to travel in an upward direction, fired from inside the limousine's trunk," and then twisting Dr. Boswell's statements into somehow confirming that the wound was actually 4 inches higher. The spin was dizzying, nauseating even; Artwohl actually dismissed the evidence for the lower entrance by claiming "Boswell's testimony and autopsy drawing refutes such a low entry point." He then spun that since Boswell told the HSCA that the entry wound was at the posterior edge of the large defect, and since the X-rays showed the posterior edge of the large defect to be near the top of the head, close to the HSCA's cowlick entrance, that Boswell's statements were actually more "consistent with an entry wound 10 cm above the EOP at the posterior edge of the large skull defect."

This was absolute rubbish, of course, and mighty strange rubbish at that. First, Artwohl overlooked that the posterior edge of the large defect changed locations after the scalp was peeled back and skull fell to the table, and that Boswell was almost certainly referencing the posterior edge of the second much larger defect. Second, he was willfully avoiding that the lower wound location was not just Boswell's recollection, but that of the rest of the autopsy team. And third, he was boldly ignoring that Humes and Boswell, in the very article under attack by the conspiracy theorists--the very article he was supposedly defending--had confirmed their original impression of the entrance wound by claiming the wound was "slightly above" the EOP, and that his article was therefore as much an attack on their competence as anything published by what he condescendingly called the "conspirati."

But the dishonesty and/or hypocrisy of those claiming the bullet wound was higher is not the only reason to believe the autopsy's description of the entrance wound was correct, and that the Clark Panel and HSCA's proposed entrance "clotted blood" of some sort. When one considers that the hole described in the autopsy report is 15 mm x 6 mm, a proportion of $2\frac{1}{2} \times 1$, and that Humes' handwritten version of the report further notes that this entrance was "tangential to the surface of the scalp", and then considers that the hole or clotted blood in the cowlick is almost round, and is, at most, $1 \times 1\frac{1}{2}$, and a through and through hole, then it should be clear that the shape in the cowlick is not the entrance wound described by the doctors. When one considers further that NOT ONE witness of the dozens interviewed who saw the President after the assassination in Dallas and Bethesda recalled seeing an entrance wound in this cowlick location, moreover, this fact should be startlingly clear. Crystal.

So what happened to the wound described by the doctors? While in the Dox Drawing there seems to be no trace of a bullet entrance anywhere near the splash of white matter (where the autopsy doctors placed the entrance), on the original photograph there appears to be a small hole just above and to the right of this matter. I suspect this is the entrance hole observed at the autopsy. That this hole was added to this never-officially released photo by someone from the research community is refuted by the simple fact that before I started doing so no one from the research community of whom I was aware had ever acknowledged its existence, and that this shape is indeed apparent on the Dox drawing, once one notices it in the autopsy photo.

Well, why hasn't anyone noticed this before? That an entrance hole in the hairline vindicating Humes' testimony runs counter to three of the most widely held conspiracy theories on the assassination, i.e. that the bullet striking the President in the head came from the front and exited from the back of his head, that the autopsy doctors were, of necessity, party to the conspiracy, and that the autopsy photos

were altered to hide an *exit* hole in the back of the head, could very well be a factor in many a conspiracy theorist's failure to notice the hole. But there are many single-assassin theorists out there on the constant lookout for anything that will support the findings of the original autopsy. Why can't they see it?

Well, perhaps they are afraid to acknowledge that the autopsy doctors were correct, and that the wound was not only low on the skull, throwing the head shot trajectory into doubt, but as little as 6 mm in its smallest dimension, suggesting that a bullet smaller than 6.5 mm was responsible. It WAS undoubtedly helpful to the lone nut cause, after all, to claim the entrance on the skull was really 9 mm in its smallest dimension, ala the HSCA pathology panel, than that it was only 6 mm, and possibly even smaller than what was believed to be the fatal bullet, ala the official autopsy report. This 6 mm measurement was so problematic, in fact, that the author of chapter 3 of the Warren Report, presumably Arlen Specter, chose to lie about it.

Here is the discussion of the wound in the autopsy report:

"Situated in the posterior scalp approximately 2.5 cm. laterally to the right and slightly above the external occipital protuberance is a lacerated wound measuring 15 x 6 mm. In the underlying bone is a corresponding wound through the skull which exhibits beveling of the margins of the bone when viewed from the inner aspect of the skull."

And here is how Dr. Humes testified regarding this wound: *"The size of the defect in the scalp, caused by a projectile could vary from missile to missile because of elastic recoil and so forth of the tissues. However, the size of the defect in the underlying bone is certainly not likely to get smaller than that of the missile which perforated it, and in this case, the smallest diameter of this was approximately 6 to 7 mm., so I would feel that that would be the absolute upper limit of the size of this missile, sir."*

Note that Humes now suggests that the wound on the skull could be as much as 7 mm wide, slightly wider than the bullet. But the impact of a high-velocity bullet on a skull would almost certainly leave a hole measurably larger than the bullet itself. So how does the commission deal with this problem?

They don't. Instead, they blow smoke. Here is the discussion of this wound on page 129 of the Warren Report:

"The smaller hole on the back of the President's head measured one-fourth of an inch by five-eighths of an inch (6 by 15 millimeters). The dimensions of that wound were consistent with having been caused by a 6.5-millimeter bullet fired from behind and above which struck at a tangent or an angle causing a 15-millimeter cut. The cut reflected a larger dimension of entry than the bullet's diameter of 6.5 millimeters, since the missile, in effect, sliced along the skull for a fractional distance until it entered. The dimension of 6 millimeters, somewhat smaller than the diameter of a 6.5-millimeter bullet, was caused by the elastic recoil of the skull which shrinks the size of an opening after a missile passes through it."

Yes, you got it. Humes testified that a hole on the scalp might shrink but that a hole on the skull would not, and the author of the report instead claimed a hole on the skull would shrink. This served to cut off any speculation regarding the small size of the bullet entrance on the skull. Now isn't that special?

But I digress. We were discussing the unwillingness of those claiming Oswald acted alone to acknowledge the round wound I've spotted in the autopsy photos--right where the doctors said it was.

Well, perhaps they just haven't spent as much time looking at these photos as I. I studied the photos for a year or more before noticing what I now believe to be the hole.

And there's also the possibility that--dare I say it--I have a heightened ability when it comes to interpreting certain kinds of images. I recall a gator watch on the bayou during a vacation in New

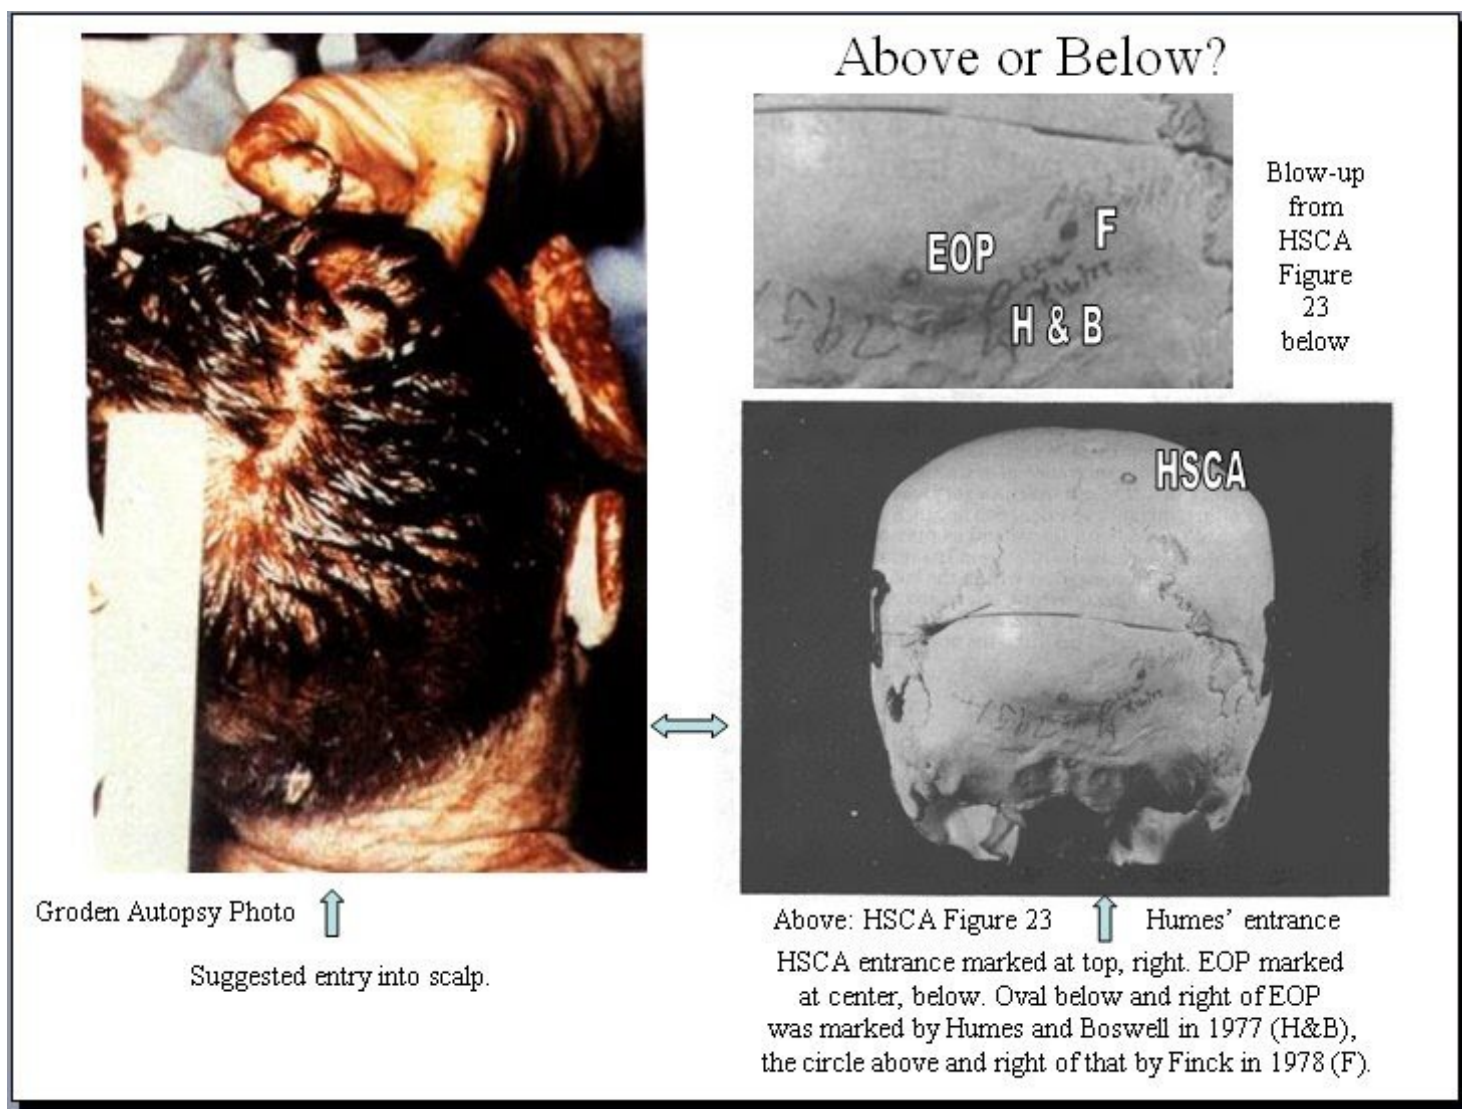

Orleans. There were roughly 25 people on the boat. Out of the roughly 20 gators spotted by this group, I was the first to spot 12-15 of them. I have no idea why. People on the boat were laughing, and accusing me of being some sort of ringer, or of having Superman's eyes.

But, fortunately, there's no need to propose any special abilities on my part. For the proper answer to the question of why hasn't anyone noticed this before is this...THEY HAVE.

Let's recall that, in 1975, Dr. Fred Hodges, when discussing the color back of the head photo on the slide above, had claimed it showed "a large, compound, comminuted injury in the right frontal region, and a small round soft tissue wound in the occipital region." Well, what other small round soft tissue wound in the occipital region could he be talking about? As the "cowlick" entrance was not what one would call a soft tissue wound, and was not even in the occipital bone, it follows that Hodges was thinking of the dark round shape I've identified.

And Hodges wasn't alone. In 2010, I discovered an image in the collection of researcher Anthony Marsh in which the dark oval above the white substance was circled, and on which someone had written that this was the entrance described at autopsy. While Marsh couldn't remember where he got this image, he was able to relate that this image pre-dated my interest in the assassination by several years. So I wasn't the first to spot this alligator...

No, not by a long shot...

Above or Below?

Only adding to my suspicion that the dark shape on the autopsy photo is the entrance observed at autopsy is that when one compares the dark shape with the entrance location marked on a skull by the autopsy doctors, they nearly overlap. While the autopsy report and the marked skull depict the wound as being slightly above the EOP—the external occipital protuberance, the bump at the back of Kennedy's head--and the photos indicate it was slightly below, the doctors were inconsistent in their testimony as to whether the entrance was above or below. During Dr. Humes' discussion with the HSCA, for example, he told them that after looking at the autopsy photos he now believed the wound was slightly below the EOP.

So why couldn't the doctors from the autopsy successfully point out the low entrance wound when shown the autopsy photos by the HSCA in 1978 and The Assassinations Records Review Board (The ARRB) in 1996? After all, they'd found it twice before. Twice...

As discussed, when the Kennedys turned the autopsy materials photos over to the National Archives, the Archives arranged for Dr. Humes, Dr. Boswell, the autopsy radiologist John Ebersole, and the autopsy photographer John Stringer to catalogue the photographs and x-rays and create a Report of Inspection on November 1, 1966. This was the first time the autopsists had been allowed to see the

photographs. Their report, signed November 10, 1966, describes photos 15 and 16 as “depicting a wound of entrance in right posterior occipital region” and transparencies 42 and 43 as “color prints of the missile wound in right occipital region.”

Similarly, on the January 26, 1967 report prepared for the Justice Department, Humes, Boswell, and (a rushed-back-from Vietnam) Finck assert that “the autopsy report states that a lacerated entry wound measuring 15 by 6mm (.59 by 0.24 inches) is situated in the posterior scalp approximately 2.5 cm (1 inch) laterally to the right and slightly above the external occipital protuberance” and that “Photographs No.s 15, 16, 42, and 43 show the location and size of the wound.”

Were they lying when they said they saw the entrance wound?

Were they scared to point it out after the Clark Panel and the government “officially” decided this entrance didn’t exist?

Or were the photos in the archives “doctored” between 1967 and 1977?

If so, it would most probably have taken place after 1975. As we've seen, the April, 1975 report of Dr. Fred Hodges to the Rockefeller Commission reflects that in his interpretation a colored autopsy photo (presumably the one above) showed “a large compound comminuted injury to the right frontal region, and a small round soft tissue wound to the right occipital region” which was “in keeping” with the wound “described in the autopsy report in the right occipital bone.” The Clark Panel and HSCA's “cowlick” entrance is, of course, in the parietal bone.

And then there's this little morsel... Doug Horne, a member of the ARRB staff, is reported to have told a crowd at a 1998 assassination conference that he witnessed both Humes and Boswell point out where they believed the entrance to be during their ARRB testimony, and that this entrance was the same for each man. According to Joe Backes’ notes on the conference, Horne then said the spot they selected was a spot behind the right ear “that seemed dark and intact in the photo.” While this could be a reference to the entrance proposed above, the transcripts of the doctors’ testimony do not reflect they ever pointed out such a spot to their interviewer Jeremy Gunn. Hmmm. If Backes’ notes and Horne’s words are to be trusted, this suggests that either Gunn failed to make a note of where the doctors pointed (which seems strange considering that that they were interviewed, in no small part, so that he could record their impressions of the wound locations) or that even the ARRB transcripts have been “doctored.”

Arrows point to suggested entry into scalp.

Fox Autopsy Photo

HSCA Figure 15/Fox Autopsy Photo Comparison

As a result of the autopsy doctors' failure to point out a hole in the hairline, outside of vague comments that it was near the splash of mysterious gray matter, the HSCA's pathology panel opted to confirm the findings of the Clark Panel and assert that the three doctors who actually inspected the President on the night of the autopsy, Humes, Boswell, and Finck, were all incredibly mistaken and had even recorded his head wound in the wrong bone. Suspiciously, in the pathology panel's report, they mentioned that they searched the area around the splash of gray matter near the hairline but were convinced there was no wound at that location. What was not stated was that the close-up of the gray matter they placed in their report was a close-up of gray matter taken from a different photo than the one they had Ida Dox copy. The photo they took the close-up from can be found on the internet, however. While the bullet hole is less apparent in this photo, it is still visible, which makes me suspect that it is indeed a bullet entrance and not just an aberration on the other autopsy photo. In fact, the only aberration seems to be that the HSCA medical panel cropped this photo just below the possible bullet hole, so that the bullet hole can not be seen on the close-up image shown the autopsy doctors, and subsequently published. Or was this just another coincidence?

That this hole near the EOP was deliberately ignored because it was inconsistent with the damage done

to the President's brain and skull, and would therefore necessitate an additional shot, is lent credence by the testimony of Dr. Humes before the HSCA. Oddly, it is the testimony where he admits he was wrong and confirms that the hole in the cowlick was the real entrance. He says: "We described the wound of entrance in the posterior scalp as being above and to the right of the external occipital protuberance...it is obvious to me as I sit here how...the upper defect to which you pointed or the upper object is clearly in the location of where we said approximately where it was, above the external occipital protuberance; therefore, I believe that is the wound of entry...By the same token, the object in the lower portion, which I apparently and I believe now erroneously identified before the most recent panel, is far below the external occipital protuberance and would not fit with the original autopsy findings.." Humes' contention that the gray matter's location was ruled out because it was a centimeter or so *below* the original measured position by the EOP, and that therefore the wound in the cowlick 10 centimeters *above* the EOP must be the real location, is one of the strangest statements of all time. It's akin to someone viewing a police line-up where the perpetrator was believed to look like Mel Torme, and choosing Shaquille O'Neal because Mickey Rooney was just too damned short. Humes' focus on the EOP is nevertheless a red flag indicating there was great concern that his saying the entrance wound was below the EOP would bring the medical panel's findings there was one shooter firing from behind into question. Notice the way he says "clearly in the location of where we said approximately where it was" when it was four inches away on a different bone. Clearly, wrongly admitting a colossal error in order to help perpetuate a lie didn't come easy to the man. According to author David Lifton, who spoke to Humes afterward, Humes' hands were trembling. According to Dr. Boswell, when he confronted Humes with the rumor that Humes had agreed that their autopsy report was wrong and that the entrance was near the top of the head, Humes flatly denied it.

When asked about his twists and turns regarding the position of this entrance wound by Jeremy Gunn of the ARRB, Humes only got himself in deeper, stating "I experienced great difficulty in interpreting the location of the wound of entrance in the posterior scalp from the photograph. This may be because of the angle from which it was taken, or the position of the head, etc. It is *obvious* that the location of the external occipital protuberance cannot be ascertained from the photograph. I most firmly believe that the location of the wound was exactly where I measured it to be." Could it really have been that difficult to distinguish between the position of the EOP, near the middle of Kennedy's head, in the occipital bone, and the purported in-shoot in the cowlick, 4 inches away near the top of Kennedy's head in his parietal bone, when you have a photograph of his entire head and neck???

cowlick, above, and hairline, at right.

Eye of the Beholder

When I compare the photos of the back of Kennedy's head, I find it remarkable that what appears to be a small hole appears in each photo slightly above and to the right of the gray matter. Even more remarkable is that this hole is in the exact same spot in each photo, and precisely where the doctors said there was a bullet hole. To me, this is clearly the wound described at autopsy. But that's just me. Now years after I first came forward to promote this round shape as the long-lost entrance on the back of Kennedy's head, I've found few theorists of any stripe willing to abandon their pre-conceptions.

But the wound is there, nevertheless, plain as day. It really makes me wonder if truth, much as beauty, is purely in the eye of the beholder.

When I compare the cowlick entrance in the photos, I find something else to shake my head about. For here, it seems equally clear that the purported hole in the cowlick is much fainter on the black and white photo, and almost certainly not a bullet entrance. I'm not the first to notice this. Dr. Humes noticed this as well, and pointed this out in his discussion with the HSCA Forensic Pathology Panel. He explained that he rejected the mark in the cowlick as an entrance because: "despite the fact that this upper point that has been the source of some discussion here this afternoon is excessively obvious in the color photograph, I almost defy you to find it in that magnification in the black and white."

And he wasn't the only doctor to make such an observation. Within the Harold Weisberg Archives (in a

book on the photographic evidence by John Woods, included in the "White Files") is an unpublished article by Mark Crouch, the researcher who befriended former Secret Service photographer James Fox, and who subsequently made the black and white autopsy photos developed by Fox available to the research community. Well, in this article Crouch relates that he didn't stop there, and that "On 5 separate occasions" he masked out the scalp and tissue surrounding the supposed entry wound on the black and white autopsy photo of the back of the head and asked doctors if they could tell what kind of wound was depicted. According to Crouch, "4 said the wound appeared to be a burn while the 5th said it appeared to be a skin rash." When told it was purported to depict a penetrating wound, moreover, all 5 were reported to scoff at the notion, and tell Crouch "no doctor could make that statement to any degree of certainty."

That the mark seen on the black and white photo is so clearly not a bullet hole, unfortunately, has led still other doctors to push that the entrance wound on the Dox drawing was completely fabricated. This is not remotely fair, and is yet another reminder that conspiracy theorist doctors are every bit as capable of deception as single-assassin theorist doctors. Incredibly, in two separate articles in the collection *Murder in Dealey Plaza*, published 2000, Drs Gary Aguilar and David Mantik place the Ida Dox drawing (copied from the color photo of the back of the head) by the black and white photo for comparison. Dr. Aguilar's caption reads: "...The small spot towards the top of the skull, which appears red in color photographs, was said to be an entrance location...The wound described is not evident in the actual photo." By his use of the phrase "actual photo," Aguilar had implied that the color photo was but a color version of the black and white. This was not true.

Fortunately, he tried to correct this mistake. In September 2006, when challenged online by an irate single-assassin theorist about this caption, Dr. Aguilar readily admitted his error, stating "it appears that I did indeed use the wrong image of the back of JFK's head. The only one I had was from a high quality black and white, 8x10 set that I'd gotten from Tink Thompson and used for this image. My error was in not realizing that there was a tiny change in perspective in the correct image vs. the one I showed." Dr. Aguilar has in fact used the color photo in subsequent comparisons. He has also disavowed his use of the term "actual photo". He related "I never noticed that phrasing before and I don't think I'd write it that way today, if I actually wrote it originally, as opposed to the editor's having written it. I simply don't now recall."

Intriguingly, this last statement suggests that the misleading caption was written by the editor of *Murder in Dealey Plaza*, Dr. James Fetzer. If true, this might help explain why a nearly identical mistake was made in Dr. Mantik's article in the same book. Dr. Mantik's caption reads: "Ida Dox inexplicably enhanced the red spot in her drawing. The actual entry is not visible; *no other photograph shows it either.*"

Dr. Fetzer, however, would later insist that both captions were written by the authors. In a January 2010 post on the Education Forum, he explained: "*I shall have more to say about this, but Speer appears to have noticed something that has escaped the rest of us. These captions were the author's own. Notice that Gary's captions tend to be rather longer and more detailed than my captions in the Prologue, for example, where only rarely do I offer more complex ones. I have no doubt the captions were authored by Gary and by David themselves. If they were missing from the original manuscripts, I may have called them to compose them.*"

Fetzer's explanation was not entirely satisfactory, however, in that he failed to acknowledge that he not only published what he now acknowledges was a misleading comparison in two different chapters of *Murder in Dealey Plaza*, published 2000, but that he repeated this misleading comparison in a chapter all his own in 2009. Fetzer's mistake, moreover, was actually worse in that he compared the wrong part of the scalp in the black and white photo to the part of the scalp showing the supposed cowlick entrance in the color photo, and then claimed the supposed cowlick entrance could not be seen at all in the black

and white photo. (One can see this for oneself on page 357 of his chapter, [here](#).) And so it appears that two respected writers made an identical mistake, and that their editor not only failed to catch it, but repeated it and amplified it.

Still, whenever one points out the mistakes of researcher/writers such as Aguilar, Mantik, and Fetzer, one should also inject some perspective, and note that, while their mistakes may mislead a few unsuspecting readers, they positively pale in comparison to the mistakes made by the mainstream media most every time they write a bout the assassination. In a May 20, 1992, AP article reporting on a press conference held by Dr. Humes and Dr. Boswell, for example, the AP printed drawings of an entrance wound on the back of a head and beveling of the skull. Hundreds of thousands of readers were fooled into thinking these drawings supported the statements of the doctors, who, in an effort to combat some of the assertions in Oliver Stone's film JFK, had asserted "The second, fatal shot entered the back of this head and exploded the right side of the skull." The problem was that the drawing provided by the AP depicted the bullet entering near the top of Kennedy's skull, in the HSCA entrance, when the doctors were describing the wound as measured at autopsy, 4 inches below this entrance. This "mistake" by the mainstream press thus effectively hid from the public that the doctors were not only arguing against Oliver Stone, but also EVERY government panel to look at the assassination since 1968. Apparently, the AP didn't consider that news worth reporting.

Back of the Head Comparison

An additional reason to believe our proposed hole in the hairline is Dr. Humes' long-lost entrance near the EOP comes from the fact that, when one looks at the gruesome autopsy photo of the back of the President's head once his brain was removed, the hole is once again right where you'd expect it to be,

showing signs of the “tunneling” described by the doctors.

Significantly, if one matches the open-cranium photograph and the back of the head photo one can use the ruler in the latter to measure the size of the wound in the former. If one estimates that the camera was 12 inches from the ruler, and that the wound was 1 inch beyond that, and assumes the camera was not using a zoom lens, then one can guesstimate that the wound was 8 percent larger in reality than measured on the ruler. This makes the wound approximately 16 mm wide. The entrance wound measured by the doctors was 15 mm wide. I firmly believe this is that wound.

Since this autopsy photo of the cranial cavity has never been officially acknowledged or released, however, the possibility exists it's a fake. A look at the history of this photo, and of its use by conspiracy theorists, however, should lay these concerns to rest. While the open-cranium photo has been published in the books of David Lifton, Robert Groden, Harrison Livingstone, and Walt Brown, none of these books mentioned the bullet hole. While Noel Twyman, in his book, *Bloody Treason*, acknowledges that something is there, his drawing of the photo suggests the hole is the external occipital protuberance, the bump on the back of Kennedy's head.

On November 20, 2004, I met Robert Groden in Dealey Plaza and asked him about the autopsy photographs' depiction of a hole in the hairline. Surprisingly, he readily agreed that the hole near the hairline in the open cranium photograph was an entrance wound. Even more surprising, he insisted that he'd always acknowledged it as so. In *The Killing of a President*, in which Groden summarized his views on the assassination, Groden described 8 likely shots, none of which entered low on the President's skull from behind. One hopes this was just a misunderstanding.

On January 25, 2006, via personal correspondence, David Lifton also acknowledged that the proposed bullet hole on the open cranium photograph was the entrance wound described at autopsy. Consistent with his theory that the body was changed between Dallas and Bethesda, Lifton explained that in his opinion the men who faked the bullet entries on Kennedy's body created two false entries on the back of Kennedy's head, one low and one high. He theorized that Dr. Humes was pressured into acknowledging only one of them in his autopsy report. From this it appears that Lifton has made some subtle changes to the theory he first presented in his best-seller *Best Evidence*.

And, oh yeah, FWIW, pretty much everything-is-fake theorist Jack White has acknowledged multiple times that he believes the presumed bullet hole in the black and white photo of the open cranium is the bullet hole described at autopsy.

Chapter 13b: Attack of the Clones

Behind the Scenes of the HSCA's Investigation

Fox Autopsy Photo/ HSCA Figure 25 Comparison

Fox Autopsy Photo

Figure 25—Closeup photograph of the semicircular exit defect in the margin of the fracture fragment in the right parietal region.

HSCA Figure 25

For reasons beyond my grasp, the first image in each chapter sometimes fails to appear. If there's nothing up above, don't despair; you can still see the image [here](#)

Fox Autopsy Photo/HSCA Figure 25 Comparison

Since the photograph taken from behind the President's skull showing the empty cranium seems to confirm the autopsy doctors' description of an entrance wound in the hairline, it's important to try and establish if this photo is authentic.

Unfortunately, there is no record of a photo of the brain cavity taken from behind on the list prepared by the autopsy doctors for the Justice Department on January 26, 1967; nor is there one on the list of photos in the Clark report, nor in the HSCA report. There is, however, a record of photos taken of the President's brainless skull from the front and from above.

When one looks at a blow-up of one of these photos purportedly depicting the "exit defect in the margin of the fracture fragment of the right parietal region," the outshoot above the Presidents' temple, moreover, one realizes that an awful mistake has been made, as this blow-up was obviously blown-up from one of the photos taken from behind.

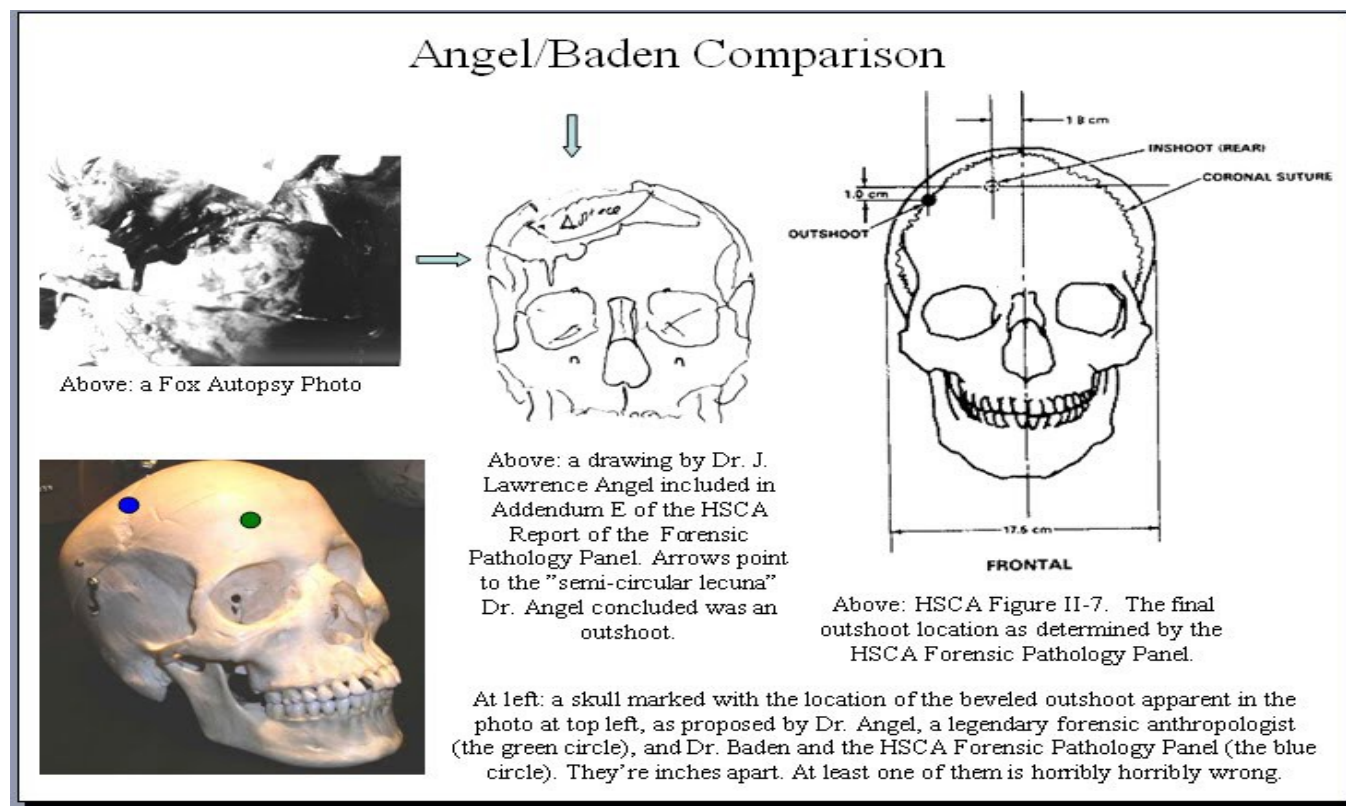

What's going on here?

Only adding to the strangeness is that Figure 25 was blown up from photo #44, which the HSCA Forensic Pathology Panel Report describes (along with black and white photo #17) as "close-ups of the margins of the fracture line in the right front-parietal region after reflection of scalp." Since elsewhere in the HSCA Report, and in several earlier government reports, it is acknowledged that photographs 17 and 18 were the black and white photos depicting an open cranium, and photos 44 and 45 the color photos depicting the same, this brings up the question of whether photos 18 and 45 were even shown to

the Forensic Pathology Panel. When they discussed the photos with Dr.s Boswell and Humes in 1977, they only showed them photos 17 and 44. This led me to question for a moment if photos 18 and 45 were withheld for some reason. It seems the answer is no, however, as the panel's Dr. Petty, when discussing the beveling on the skull with Humes and Boswell, informed them that "this is shown more clearly on the black and white photographs Nos. 17 and 18, probably best in No. 17." Well, then why did they use #44 in their final report? I must admit I'm perplexed.

When one looks closely at the supposed exit defect in Figure 25, one can't help but be even more confused. This exit defect doesn't appear as round and beveled as the defect in the Fox photos available online. So why wouldn't the photo available online, which would presumably be either #17 or #18, have been used instead of photo # 44? Why did the HSCA use an inferior photograph? Was there something in #17 or #18 that the doctors were trying to hide from the committee? Or was it simply a matter of the pathology panel screwing up and picking the wrong photo to demonstrate the beveling?

Even more to the point, how could the Forensic Pathology Panel possibly believe this photo was taken of Kennedy's "right frontal-parietal region"--his forehead? Are we through the looking glass here or what?

Angel/Baden Comparison

To answer that last question--that of whether or not we are through the looking glass here--let me be concise: yes. Not only did the HSCA pathology panel improperly decide that the photo was of the forehead, they did so while disagreeing with the interpretations of all the previous doctors to say so, including a world expert on skulls brought in by the panel to help them interpret the photograph.

Let's remember that the autopsy doctors determined that this photo was taken of the forehead in the 1967 report written for the Justice Department. Even so, they claimed the photo reinforced their

conclusion the bullet impacted near the EOP, 4 inches lower than the entrance proposed by the HSCA panel. So they didn't exactly agree with the HSCA panel's interpretation.

Now let's reveal that the 1968 secret panel to study the medical evidence, the Clark Panel, led by Russell Fisher, a close colleague to a number of the men on the HSCA's panel, failed to note that a beveled exit defect was visible in the photos, and described the open-cranium photographs as follows "Due to lack of contrast of structures portrayed and lack of clarity of detail in these photographs, the *only* conclusion reached by The Panel from study of this series was that there was no existing bullet defect in the supra-orbital region of the skull." (Supra-orbital means the forehead!!!) As if to stress this point, the Panel's report later repeats "The photographs do not disclose where this bullet emerged from the head although those showing the interior of the cranium with the brain removed indicate that it did not emerge from the supra-orbital region." Well, this is mighty curious, isn't it? Why does this panel repeatedly insist there was no exit from the supra-orbital region visible in the photos?

Particularly when the consultant on skulls to the HSCA's pathology panel, Dr. Lawrence Angel, insisted that this is precisely what they show? Yes, you got that right. Dr. Angel's 10-24-77 report to the panel claimed "The exit area through the right frontal above the boss can account for the small semi-circular notch 35 mm above the right orbit, the radiopaque mark near this, and at the upper right part of the track can explain the radiopaque markings on the triangular frontal fragment just in front of the coronal suture above stephanion." While his words might seem confusing Dr. Angel created a drawing to depict this conclusion, and it is not at all confusing. It is clearly taken directly from the "mystery photo" of our discussion. And it clearly shows the exit defect to be exactly where the Clark Panel said it was not, 35 mm (about 1 1/2 inches) above the eye socket in the supra-orbital region. This is indeed strange since not one witness observed an exit wound on Kennedy's forehead. Also problematic is that when one matches the beveled outshoot and nearby fractures of the open-cranium photo to Angel's drawing, it becomes clear that Kennedy's eye sockets should be apparent in the photograph. Yet they are not. Even worse, when one looks at the previously discussed bullet entrance near the hairline in the photo, and looks at the photo in Angel's orientation, the obvious entrance is now on the forehead, and unacknowledged. Something is indeed wrong with Angel's interpretation.

Now let's inject that Dr. Angel was Curator of Physical Anthropology at the Smithsonian Institute, and a noted lecturer on Anatomy, Anthropology, and Forensic Science at George Washington University and the John Hopkins School of Public Health. Although it is clearly incorrect, one would think Angel's interpretation of the photo would trump that of all others.

But the HSCA panel, perhaps concerned for the reputation of their colleagues on the Clark Panel--who had repeatedly proclaimed that there'd been no exit on the forehead visible in the photo, and who had failed to mention any other exit location--refused to confirm Angel's findings, and claimed instead that the photo did indeed show an exit, as claimed by Angel, just not one on the forehead! When the HSCA trajectory report published a depiction of the outshoot on a skull, it depicted an exit defect inches above and to the side the exit defect in Angel's drawing.

And not only did the HSCA ignore Dr. Angel's interpretation of the exit location, they dismissed Angel's finding that the triangular frontal bone fragment had come from in front of the coronal suture, and asserted instead that it was parietal and had come from behind the coronal suture. (This will be shown in Exhibit F-66, a few slides below).

Should we not take the pathology panel's rejection of Angel's report as a possible indication something is indeed wrong with the orientation of the photograph used in their mutual study? And, while we're at it, might we not take the Clark Panel's insistence there was no exit on the forehead, and Angel's subsequent assertion that the photos show precisely that, as an indication that the Clark Panel *knew* the photos showed as much, but were reluctant to come to any conclusion saying as much, since they knew

this would be in clear conflict with the statements of not just the autopsy doctors, but the statements of everyone to see Kennedy's body after the shooting?

While there are those in the media who focus on the more outlandish conspiracy theorists and seek to discredit all conspiracy theorists by pointing out their lack of consistency, they fail to notice the horrific lack of consistency demonstrated by those representing the government. To my knowledge, there has not been ONE news story or report to ever point out that Angel placed the exit on the President's forehead, and that many single-assassin theorists have come to agree with him, even though not ONE eyewitness saw an exit on the forehead and no official panel has ever considered such a thing.

Baden Testimony Comparison

On September 7, 1978, Dr. Michael Baden testified before the HSCA and presented the findings of the Forensic Pathology Panel. His testimony was long and thorough, and frequently mind-boggling. At one point he presented Exhibit F-60, explaining "*the semicircular defect that I am pointing to corresponds with the black dot present on the previous exhibit*" (which was F-58). A quick look at F-60, however, reveals that it is a close-up of the beveled bone at the back of the head in the open cranium photo (previously discussed as Figure 15). What is suspicious once again, though, is that it was presented in the report not turned the way Baden purports to interpret it, but sideways from his interpretation, as if it was indeed a picture of the back of the head and not the forehead. It's also a bit odd that, even though this blow-up was taken from one of four photographs--two black and white and two color--that demonstrate the open cranium, Baden made a point of telling the commission it was taken from "*the only photograph that shows any internal structure of the President.*" When one compares the open-cranium photo to F-58, and follows Baden's interpretation of the outshoot, moreover, one can easily discern something is wrong. When one lifts the exit defect in the photo to the level of the defect in the drawing, and makes the size of the defects match, one can see that there is

entirely too much forehead in the photograph above the defect, and that it clearly is not angled the way the skull would be near the defect in the drawing. There is also the problem, already noted, that in this orientation the obvious bullet entrance in the photo is now on Kennedy's left forehead, and unexplained.

While the autopsy doctors have never voiced their disagreement with Baden's interpretation of the photo, it is nevertheless enlightening that they have repeatedly made statements indicating they remembered taking photographs depicting the bullet entrance on the back of the head, both from the outside and from the inside. Not once in all their statements, moreover, have they stated they took a photograph of a beveled outshoot at or near the President's forehead. In Dr. Humes' testimony before the Warren Commission, for example, he specifically denied there was such an outshoot, and said the only beveling indicating an outshoot discovered at the autopsy was on a large bone fragment discovered in the limousine by the Secret Service. He testified "*A careful examination of the margins of the large bone defect at this point failed to disclose a portion of the skull bearing again a wound of--a point of impact on the skull of this fragment of the missile, remembering, of course, that this area was devoid of any scalp or skull at this present time. We did not have the bone*" and stressed "*the thing which we considered of importance about these three fragments of bone* (the ones brought in by the Secret Service towards the end of the autopsy) *was that at the margins of one of them which was roughly pyramidal in shape, there was a portion of the circumference of what we interpreted as a missile wound.*" When discussing this large bone fragment before the HSCA, however, Dr. Baden told a new and improved story, a story that, not surprisingly, supported his contention the beveled bone apparent in the photo was part of his proposed exit defect. He testified: "*The doctors looked at the bone fragments, took x-rays of the bone fragments, inserted this particular bone fragment against this semi-circle and concluded that they matched and fitted together.*" If they did, it was news to them.

And news to Baden's panel. When discussing the autopsy protocol's description of the large exit, the report of Baden's panel claims: "*The description of the bone fails to recognize either the semi-circular defect or any beveling in the bone fragments still attached to the head.*" The report then quotes a February 1965 letter by Dr. Finck to his superior General Blumberg. It records Finck's thoughts as he first inspected the large defect, and relates "*No exit wound is identifiable at this time in the skull, but close to midnight portions of cranial vault are received from Dallas, Texas. X-ray films of these bone specimens reveal numerous metallic fragments. Two of the bone specimens, 50 millimeters in diameter, reveal beveling when viewed from the external aspect, thus indicating a wound of exit.*" Thus, both Humes and Finck claimed there was no apparent beveling on the intact part of the skull. While Dr. Boswell was less clear on this matter, he told researcher Josiah Thompson on 1-11-67 that the direction of the bullet in the skull was determined by the beveling at entrance, the destruction within the brain, and the beveling on the recovered skull fragment. Thus, he too confirmed there was NO beveled exit on the intact skull!

Is it reasonable then to believe all three doctors failed to note this beveled exit, when it was really on the edge of the exit defect? Or should we look for another explanation?

Oh, No!

At left: HSCA Exhibit F-60 is placed on the stand in the upright position, the same manner it was published in the HSCA Report, as shown at right.

Images from the HSCA testimony of Dr. Michael Baden, 9-7-78

Fox Autopsy Photo

But Dr. Baden grabs the exhibit and starts to turn it to match the photo in his hand, with the defect at top, as in the full version of the photo at left.

Oh, No!

Only adding to the weirdness of the pathology panel's report is that, while the autopsy doctors have never been able to identify the photo of the bullet entrance taken from inside Kennedy's skull, the HSCA forensic pathology report, when discussing the bullet entrance, states, "*Stereoscopic visualization of the inside of the cranial cavity at its depth, after removal of the brain, reveals a semicircular beveled defect in the posterior parietal area to the right of the midline, from which fracture lines radiate corresponding to the entrance perforation indicated in the skull x-rays.*" Since Dr. Baden testified that F-60 was a detail of the "*only photograph that shows any internal structures of the President at the time of the autopsy*" and since there is no photograph showing the entrance wound from the inside listed in any of the photographic reports of the HSCA, it's clear that this reference to stereographic visualization is a reference to looking at photos 44 and 45 at the same time. Well, where is this entrance? More pointedly, why didn't Dr. Baden point this entrance out in his testimony? Or his panel in their report? They had exhibit F-60 to work with. The entrance would have to be in there somewhere. Why didn't they show it to the committee?

When one dives further in the report, and reads the section entitled "*Course of the Missile Through the Head,*" it becomes clear the panel didn't spend much time on this photo because they lacked confidence it was really as claimed. While discussing photos 17, 18, 44, and 45, the report reads "*The lens was focused on the interior-posterior deepest portion of the wound, apparently in an attempt to depict the interior of the bullet perforation of the posterior region of the skull. In the photograph prepared from color transparency No. 45, the exterior bone fragment with the semicircular defect is more in focus than the base of the skull in the depth of the picture which is out of focus. In the photographs prepared from positive color transparency No. 45, the exterior fragment is out of focus, but the depth of the photograph is in sharper focus. The photographs, also studied using the computer-assisted*

enhancement technique, show a possible portion of the beveled inner table corresponding to the semicircular margin of the entrance wound at the back of the head in the right posterior parietal bone." What was formerly a revelation was now just a possibility.

While some researchers believe they see an entrance in the far back of the skull (which I interpret as the base of the skull) in the autopsy photo in question, NONE have described this entrance as "*a semi-circular beveled defect in the parietal area*" nor has anyone noted fracture lines corresponding to the skull x-rays. As strange as it may sound, the description of this defect as both "semi-circular" and "beveled" makes me suspect that Baden and/or the writers of the pathology panel's report, Dr.s Loquvam and Weston, were trying to portray the same beveled piece of bone Baden testified was an *exit* in front of Kennedy's right ear as an *entrance* high on the back of his head!

But it gets weirder. In April 2006, I was able to obtain some footage of Dr. Baden's testimony. What I saw made my jaw drop. When the blow-up of the purported exit on Kennedy's skull, HSCA Exhibit F-60, was brought out and placed on the exhibit stand, it was placed the same way it was printed in the HSCA report, with the bone stretching vertically. Dr. Baden, however, immediately sought to correct this "mistake." With the photo in his hand displaying the ridge of bone horizontally, and with the defect at the top of this ridge, he grabbed the exhibit and began to turn it to match the photo in his hand.

A World Upside Down

(1)"This is the front part of the skull of the President (2) in this area (3) and this semi-circular defect that I'm pointing to corresponds (4) with the black dot on the previous exhibit"

3 4

At right: HSCA Exhibit F-66, presented moments after the testimony quoted above, showed the large defect to be above and behind the "black dot".

All images from the HSCA testimony of Dr. Michael Baden, 9-7-78

A World Upside Down

After beginning to turn the blow-up of the small beveled exit to match the photo in his hand, however, something led Dr. Baden to stop and turn it back the other way, so that the large skull defect was now beneath the small beveled exit, which was, in turn, beneath some intact bone. Since this large defect was the opening through which Kennedy's brain had been removed, it made no sense to portray this defect as one strictly on Kennedy's right side. (That this is, in fact, an error, is demonstrated by Exhibit F-66, presented only moments after Exhibit F-60. F-66 portrays the large defect as above and behind a beveled exit on the frontal bone, with NO bone directly above the exit.)

Unfortunately, Dr. Baden's testimony compounded his error: (Image 1, Baden pointing at the skull above the defect in the photos): "This is the front part of the skull of the President (Image 2) in this area" (Image 3) "and this semi-circular defect that I'm pointing to corresponds (Image 4) with the black dot on the previous exhibit and shows a portion of a gunshot wound of exit as determined by the panel, by viewing, by being able to see beveling, that is the breaking of bone away in a certain pattern as a BB does when it goes through plate glass, causing a beveling on the glass in the direction to which the BB would proceed. This happens when a bullet enters and exits skull bones and other bones and this was a conclusion of the panel that this was an exit perforation."

Now compare this to the published transcript (with notable changes italicized): "*The photograph shows the front right part of the skull of the President and the semi-circular defect that I am pointing to corresponds with the black dot present on the previous exhibit. This is a portion of a gunshot wound of exit as determined by the panel because of the beveling of the outer layer of bone visible in the photographs, which is also described in the autopsy report.* Beveling refers to the breaking away of bone in a concave pattern as when a BB goes through plate glass causing a concavity in the glass in the direction in which the BB is proceeding. This also happens when a bullet enters and exits skull bone and other bones. It is the conclusion of the panel that this is *unquestionably* an exit perforation."

After noticing the changes in Dr. Baden's testimony, and commenting online, I received word from someone who testified before the HSCA that everyone who testified was given a transcript of their testimony and given the opportunity to change their public testimony. While I was well aware that witnesses are allowed to change their statements and depositions in the pre-trial phase of court proceedings it was news to me that anyone could go back and change the transcripts of their public testimony. Since not all of Dr. Baden's changes were grammatical—the first italicized section conceals that he was pointing to the skull, the second italicized section is new and misleading testimony (as discussed, the autopsy report made no reference whatsoever to a beveled exit on the intact skull, and Dr. Humes' testimony specifically dismissed that such an exit was apparent), and the third italicized section reflects a degree of certainty not communicated in Baden's actual testimony—one should rightly wonder to what degree the testimony of other witnesses has been changed. If anyone has all the public hearings on tape, and is willing to sit down and record the changes made in the transcripts, it would undoubtedly prove fascinating. While I would like to think Committee members were informed whenever testimony was changed, I don't think we should make such an assumption. Accordingly, if anyone knows the standard procedures involved in changing public testimony before congress, and whether the HSCA staff followed these procedures, I will include their comments in my next update.

Baden's Reign of Error

Once one realizes that the head of the HSCA's forensic pathology panel testified with one of his key

exhibits upside down, of course, one should rightly wonder why. Was he really so befuddled by the head wounds? If so, then we shouldn't place much stock in his assertion that the bone in the mystery photo is forehead. If not, then we need to figure out why he would deliberately testify in a manner that could only sow confusion among the Committee.

On 7-16-07, researcher Barb Junkkarinen related something on the alt.assassination.jfk newsgroup that feeds into the possibility Baden simply couldn't understand the photograph. She comforted single-assassin theorist extraordinaire David Von Pein, who'd been honest enough to admit he couldn't make sense of the photograph, by telling him "Baden by the way, turned my 8x10 glossy of that photo round and round then thrust his hand holding the pic in the air and shrugged his shoulders when I asked him to orient it for me at a little private lunch meeting 6 or 7 of us were able to have with Wecht and Baden in Monterey, Calif a few years ago. He didn't have a clue how it should be either."

If the photograph was so difficult for Baden to understand, then why did he testify about it, and use it as evidence the shots came from behind? Perhaps he answers this himself. In his 2001 book *Dead Reckoning*, he writes: *"Physicians may be the worst witnesses. They are often swayed by whoever asked them to be an expert. If that lawyer is smart enough to ask their advice, they conclude, he must know what he is doing. That being the case, physicians therefore adopt whatever the lawyer tells them as the facts of the case and become, if only subconsciously, an advocate for the lawyer rather than an independent adviser."*

Of course, Baden considers himself beyond such seduction. In his 1989 book *Unnatural Death*, he recounts how disgusted he was with HSCA chief counsel Robert Blakey when Blakey came to him at the last minute and asked for his help in finding medical evidence for a conspiracy. Naturally, he told Blakey he couldn't do such a thing. This pillar of decency, of course, also disapproves of the widespread availability of the autopsy photos. In his book *Dead Reckoning*, he writes: *"It is a shame. This is not a procedure that should be viewed by anyone other than those who need to know the details in the pursuit of truth."* In light of this statement, one might think he'd shy from using the photos for his own profit. But one would be wrong. On January 9, 2008, an episode of Dr. Baden's HBO series *Autopsy* featured several of Kennedy's autopsy photos, some in full color. Presumably, Baden thought that placing black lines over Kennedy's eyes made the photos fit for broadcast, and that it was better for him to make money off these slightly edited photos than have somebody else put them up on the internet for educational purposes, and for free.

If it sounds like I'm annoyed with Baden, it's only cause I am. Beyond his testifying with his exhibit upside down, he's spread more misinformation about the Kennedy assassination than just about anyone alive. Someone so out of touch with the case should not be permitted to pass himself off as an expert. Consider...

Baden's Reign of Error 2008

In the 1-09-08 episode of *Autopsy*, Dr. Baden's program on HBO, he reviewed the evidence in the Kennedy assassination, and made a number of bizarre claims. Here is a healthy sample.

1. When discussing the initial press conference given by Kennedy's emergency room doctors. Dr. Baden proclaimed *"In fact, the doctors down in Texas, where the shooting occurred, indicated he'd been shot in the back and in the front."* (The doctors, in fact, indicated no such thing. They described an entrance in Kennedy's throat and a large wound on the back of his head. They presumed this to be an exit for the bullet entering his throat. They said nothing to indicate the bullet causing this wound came from behind Kennedy.)
2. When discussing the initial autopsy, the program's narrator asserted: *"Because the pathologist's notes were stained with blood, he burned them. After he found out that a tracheotomy had been performed in Dallas, he tried to reconstitute his notes, based on what he could remember."* (This

is nonsense. Dr. Humes, the pathologist in question, testified in 1996 that he burned his notes only after copying them, and that he burned these notes the day after he found out about the tracheotomy. He'd made similar claims to Dr. Baden and the HSCA Forensic Pathology Panel in 1977, and the Warren Commission in 1964. The implication that the initial autopsy report was in error because Dr. Humes couldn't remember what he saw is thus unjustified and deceptive. Is it a coincidence, then, that this misrepresentation feeds Dr. Baden's eventual conclusion that the autopsy report was riddled with errors, but that these errors were somehow "innocent." One suspects not.)

3. Shortly thereafter, when discussing the autopsy photos, Dr. Baden repeated the story of Floyd Riebe, a navy photographer whose camera was confiscated by the Secret Service. He then explained what he considers to be the poor quality of the photos by stating *"The only one who was taking photographs was a Secret Service person who'd never taken autopsy photos before."* (This is frighteningly inaccurate. The remaining autopsy photographer was John Stringer, the Navy's top autopsy photographer, and Riebe's superior. In *Unnatural Death*, published nearly 20 years before making this statement, Baden claimed the lone photographer was an FBI photographer. This incensed the original autopsists, Dr. James Humes and Dr. J. Thornton Boswell, so much that they made a point of debunking Baden's claim in a 1992 interview with the *Journal of the American Medical Association*. One would have thought that Dr. Baden would remember his getting schooled in such a fashion, and have not repeated this mistake, but apparently Dr. Baden is correction-proof.)
4. When complaining about the autopsy report, Dr. Baden claimed that the autopsy doctors *"did not make proper measurements of the bullet holes, did not properly describe the bullet holes as to entrance and exit."* (This last statement is a puzzle. The 1978 pathology panel led by Dr. Baden came to the exact same conclusions as the autopsy report, as to which holes were entrance and exit. Perhaps he was thinking of the original conclusions of the doctors on the night of the autopsy, as opposed to the report they signed two days later.)
5. Later, Baden pronounced his support for the conclusion that Oswald acted alone and that the timing problems raised by the Zapruder film could be explained by the *"fact"* that the first shot missed. He said: *"There was only one shooter; Oswald. The Zapruder film on close analysis shows the first bullet miss and hit the curb of the road that the car was traveling."* (This is only the most ill-informed statement ever uttered by a supposed expert on the case. Not one analysis of the film, including those performed by the most zealous single-assassin theorists proposing Oswald acted alone, has claimed that a bullet strike on the curb is visible. Those holding that a first shot miss is detectable base their claims upon blurs on the film thought to coincide with rifle shots, and the behavior of a few of the witnesses. None have insinuated they could see the bullet hit a curb. Baden's contention therefore is a dead giveaway that he was making this stuff up as he went along, based on what he could remember, and that NO ONE at HBO thought to run this show by anyone with the slightest smidgen of genuine knowledge about the case.)
6. But Baden wasn't done. To combat the argument that Kennedy's back-and-to-the-left motion after the head shot indicated a shot was fired from the front, Baden argued: *"Subsequent experiments show, and subsequent experience with people being shot do show that when someone is shot from the front they can go front or back--sometimes front, sometimes back. It isn't predictable what way the body is gonna go."* (If anyone knows what "experiments" he is talking about, please bring these "experiments" to my attention. In the meantime, we can suspect that Dr. Baden was thinking of the tests performed by Dr. Olivier, and discussed in his testimony for the Rockefeller Commission. Olivier related that in tests where goats were shot in the head, the bodies of the goats fell to the ground in an almost random pattern. Baden overlooked that Dr. Olivier also related that when he'd fired upon human skulls, *"The skulls that we shot invariably rolled away from the gun."* This suggests that the back-and-to-the-left

motion of a head would not be so random.)

Baden's Reign of Error 2004

On November 22, 2004, Dr. Baden made a brief appearance on the cable TV program Investigating History: The JFK Assassination. This afforded him just enough time to make two false statements.

1. When discussing the flaws in the autopsy, Baden claimed *"The autopsy had not been done by pathologists who'd been trained in gunshot wounds. It was done by hospital pathologists."* (This was not true. Dr. Pierre Finck was a forensic pathologist and an expert in gunshot wounds employed by the Armed Forces Institute of Pathology in 1963. When testifying before the Warren Commission on 3-16-64, he asserted *"I was certified in pathology anatomy by the American Board of Pathology in 1956, and by the same American Board of Pathology in the field of forensic pathology in 1961."* When questioned by Baden and his forensic pathology panel on 3-12-78, moreover, Finck actually expanded on this point. He asserted: *"being in charge of the Wound Ballistics Pathology Branch I reviewed most missile wounds sent to the AFIP for several years so I must have -- I did not keep track by weapon or the number of injuries that I have reviewed but in my experience I have (studied) a great variety of injuries produced by a great variety of missiles from a great variety of weapons."*)
2. Shortly thereafter, Baden added *"There was the regular autopsy photographer there, taking pictures, and he was confronted, I believe, by an FBI person...They kicked him out. they opened up his camera and exposed all the film."* (For this program, anyhow, Baden stopped short and did not make the related claim that the photos in the archives were taken instead by an FBI agent, and that that is why these photos lack clarity. But that's clearly where he was headed...)

Baden's Reign of Error 2003

In November 2003, Dr. Baden spoke at the Wecht Conference at Duquesne University. In attendance at this conference, and in his audience, were a number of his fellow forensic pathologists. There were also dozens of amateur experts on the Kennedy medical evidence. While one might think that Baden did a little studying before his appearance, in order to avoid embarrassment, one would be wrong. Here, as on HBO, he appears to be "winging" it.

1. When discussing the autopsy report, he stated: *"Dr. Humes also took notes and he destroyed the notes before he wrote his report, which is one of the reasons his measurements were off."* (As previously discussed, this is nonsense. Dr. Humes clarified this issue in 1996 by asserting he destroyed his notes only after writing his preliminary report. While Dr. Baden may wish to believe Humes burned his notes before copying them, as that offers him an explanation for what he believes to be Humes' mistaken impression of the entrance location on the the back of Kennedy's head, there is really nothing to support this.)
2. After telling the story of Floyd Riebe, the Navy cameraman whose camera was confiscated by the Secret Service, Baden asserted: *"Other, somebody else, took the photographs for the Secret Service, for the FBI, who had not taken such photos before. We have those photos. They are blurry. They are not the proper photos."* (As previously discussed, the photographs were taken by Riebe's boss, John Stringer, the Navy's top autopsy photographer, who'd taken thousands of "such photos" before.)
3. Baden then discussed the autopsy photo of the empty cranium. He stated: *"There is enough to show in the bullet wound of the inside of the cranial cavity an entrance perforation through bone in the back of the head..."* He then asks them to put an x-ray on screen. He points out the level of the EOP entrance. He points out the level of the cowlick entrance. He then stated: *"Clearly when we look into the cavity on the photograph, the internal beveling is here." A bit later, when he returned to a discussion of the entry wound described at autopsy, he re-affirmed*

his assertion that an entry wound is visible on the interior aspect of the "mystery photo." He said: *"They described it as four inches too low, and it doesn't match the x-rays; it doesn't match the one interior view of the skull that's useful."* Still later, when confronted on this point during a panel discussion, he claimed: *"There was inward beveling that we could see in one of the photographs--in fact the one that you showed up there. When you look at it closely, we all 8 of us--I think Cyril agreed also--that there was inward beveling on the upper portion of the back of the skull. There was no occipital bone entrance."* (This is quite interesting. While the pathology panel's report did indeed assert there was *"a semicircular beveled defect in the posterior parietal area to the right of the midline, from which fracture lines radiate corresponding to the entrance perforation indicated in the skull"* there is no exhibit in the report to demonstrate this entrance. Dr. Baden never mentioned it in his testimony. Nor did he show it in this presentation, or point it out to others when its existence was challenged. It seems clear from this that Baden never really had any confidence that what he saw was an entrance, and was only pretending he was confident, hoping no one would call him on his bluff. Far from Dr. Baden's assertion, moreover, that when one studies the photo, a beveled entrance on the *"upper portion of the back of the skull"* becomes apparent, most who've studied this photo have concluded there is no bone at all in the location of Baden's purported entrance.)

4. While trying to explain the autopsists' mistakes, Baden then cited the March 1978 testimony of Pierre Finck. He said: *"Pierre Finck says to us, when he testified, 'For 20 years I've been looking at autopsy reports; I never did an autopsy in a gunshot wound case.'"* (This is 100% wrong. When Dr. Finck testified before Baden's pathology panel on 3-11-78, Baden asked him if he'd ever personally performed an autopsy on a gunshot victim. Finck's job in 1963 was reviewing autopsies performed by others on behalf of the Armed Forces Institute of Pathology. Finck responded *"Well, I was not always at the AFIP. I had duties as well where I performed autopsies of gunshot wounds before 1959."*)
5. When discussing Dr. Humes' original impression of the back wound, he stated: *"Humes looks in the back, sees the wound in the back, doesn't appreciate there's an exit wound in the front, so he says, and then later denies, but the Secret Service guys have it in writing while they're taking down every word he says, that uh, the bullet must have gone in, stopped, turned around, and came out the same entrance."* (This passage includes a number of mistakes. First of all, no one took down Dr. Humes' every word at the autopsy. Second of all, it was FBI agents Sibert and O'Neil who wrote the report to which Dr. Baden refers. Third of all, there is nothing in their report indicating that Dr. Humes felt the bullet turned around inside Kennedy. It asserts instead that Humes felt *"the bullet had worked its way back out of the point of entry"* during external cardiac massage.)
6. When proposing that the single-bullet theory still works, even though his panel found that the back wound was below the throat wound, he described Kennedy's position at the time of the shot: *"He's leaning forward enough to make a 20 degree angle or so."* (As he said this Baden leaned far further forward than Kennedy appears to be leaning during the period Baden proposes Kennedy was shot.)
7. He then threw in *"And remember he has Addison's disease--he's taking steroids for the Addison's disease. He has a little hump on his back from the fat that steroids cause."* (This is a clear reference to Dr. Lattimer and his somewhat deranged suggestion that Kennedy was a hunchback, and that his hunch deflected the bullet down his neck. Dr. Baden doesn't seem to realize that this explanation was offered by Lattimer to explain why the back entrance appeared to be below the throat wound, when it was not. As Dr. Baden believes the back wound really was below the throat wound, and traveled upwards in the neck, the hump is completely irrelevant to his point. That he cannot see this only demonstrates his basic confusion.)
8. He then repeated another Lattimer myth already discussed. While discussing Connally's back

wound, he claimed: *"The bullet entered sideways, not straight on. It had to have hit something first--an intermediary target. The intermediary target was the President."* (As previously discussed, Connally's doctor, Robert Shaw, insisted that the bullet was not traveling sideways upon contact with the skin, nor in its approach to his rib.)

9. Later, under questioning, when asked about the single-bullet theory, he asserted: *"Mrs Connally states in her new book that Governor Connally heard the first shot--that's the one that we concluded hit the curbside--you can see that in the Zapruder film."* (This is a pre-cursor to his latter statement on HBO. It is, of course, ludicrous. No one can see a bullet strike a curb in the Zapruder film.)
10. He then discussed the shot at frame 313 of the Zapruder film: *"That bullet then strikes the President in the head, narrowly missing Mrs. Kennedy, and breaks apart when it strikes the strut in the windshield, and is found in the windshield."* Later, when asked how he could explain the different behaviors of the two bullets--one that goes through both Kennedy and Connally, and is barely damaged, and another that seems to explode upon impact, he repeated: *"The bullet striking President Kennedy in the back of the head, causes this tremendous explosion in the right side, when that bullet leaves...it then strikes the metal frame in the center of the windshield, and that's when it breaks apart. It doesn't break apart--and that's why both pieces are found right underneath the metal strut in the front of the vehicle."* (This ignores that there were two impacts on the front the limo, one on the inside of the windshield and one on the inside of the windshield strut, and that this suggests the two pieces, one the nose of the bullet, and one the base of the bullet, exited separately from the skull. By asserting that the bullet passed through the skull intact, moreover, Baden was exposing himself as a single-assassin theorist unconcerned with the available evidence. The Warren Commission's wound ballistics expert Dr. Olivier, after all, had not only testified that the bones of the skull were *"enough to deform the end of this bullet,"* but had presented bullet fragments recovered from the cotton waste behind his test skulls that were *"quite similar"* to the fragments found in the front seat of the limo. His report and subsequent statements, moreover, specified that the *"nose of the bullet erupted on"* the back of nine of the ten skulls fired upon. And he wasn't the only one to note this tendency. Dr. Lattimer, after performing his own tests of the ammunition, similarly reported, in a 1976 article in Surgery, Gynecology, and Obstetrics, that the bullets in his test firings *"always broke up on striking the skull and then diverged, making a larger wound of exit."* That the bullet broke up on impact with the skull, and not after its exit, is so clear, in fact, that Dr. Russell Fisher, Baden's mentor, had no problem saying as much in the Clark Panel's report, writing *"The projectile fragmented on entering the skull, one major section leaving a trail of fine metallic debris as it passed forward and laterally to explosively fracture the right frontal and parietal bones..."*)
11. While this marked the end of Baden's presentation, he received an opportunity to explain this last point further during a subsequent panel discussion. When asked why the bullets behaved so differently, Dr. Baden said of the bullet striking Kennedy's skull: *"It doesn't fragment. It strikes the strut in the window, and the two portions..."* Dr. Randy Robertson interrupted him here and pointed out the fragments in the brain, to which Baden replied *"It's lead coming out from the back of the bullet, back of that bullet, and when it strikes the strut in the window is when it breaks apart. And the two portions are collected from the vehicle."* Here Robertson again interjected that the bullet would have to have fragmented to leave that trail. Baden responded: *"It squeezed out the back, what happens with full-metal jacket bullets."* (Here, Baden's refusal to make sense is once again made clear. Somehow, he actually forgot that a circular fragment of the bullet striking Kennedy in the skull was determined by his panel to have come to rest on or in the back of Kennedy's skull. This fragment, moreover, was reportedly 6.5 mm wide--the width of the rifle's ammunition. This undoubtedly implies this fragment was a slice from the

middle of the bullet. This makes his assertion that the fragments in the skull were nothing but lead that had squeezed out the back of the bullet bizarre, to say the least. It is also inconsistent with his testimony before congress, as he told them that the supposedly 6.5 mm fragment was a piece of metal that *"rubbed off from the bullet on entering the skull and was deposited at the entrance site."* Being rubbed off from a bullet is not the same as being squeezed out the back of a bullet. Not in this universe. That Baden's fellow pathologists on the HSCA panel did not share his strange assertion that all the lead in the skull, including the 6.5 mm fragment, was squeezed out of the back of the bullet was made more than clear, moreover, in the panel's final report, which claimed *"The small missile fragment present at the margin of the entrance wound was probably a portion of the missile jacket..."*)

Baden's Reign of Error 2000

On 2-20-2000, Dr. Baden met with a number of JFK assassination researchers, including Dr. Gary Aguilar and Dr. David Mantik, for an extended lunch and discussion of the case. While this was designed as an informal discussion, Dr. Baden has, both prior to this meeting, and after, presented himself as an expert on the case. As a result, the mistakes he made in this discussion are worth noting and his bogus claims worth quoting.

1. First of all, it's important to note that, during the discussion of the autopsy photos, Dr. Baden repeatedly cited the Riebe story and tried to claim the photos had been taken by a Secret Service agent or FBI agent with no experience. He was corrected on this point, also repeatedly, by Dr. Gary Aguilar, and told the photos were taken by John Stringer, the Navy's top autopsy photographer. This, then, proves that Baden should have known better when he subsequently repeated the Riebe story and claimed the photos were taken by an "agent" of some sort.
2. Second of all, it's important to note that, during the discussion of the x-rays, Dr. Baden refused to argue with Dr. Mantik over the location of the supposed 6.5 mm bullet fragment supposedly found on the back of Kennedy's head. He insisted, first, that you couldn't tell where the large fragment on the A-P x-ray was located on the lateral x-ray. After being told by Mantik that the HSCA's radiologists--the radiologists whose reports Dr. Baden placed into evidence--had claimed that, yes, indeed, this fragment was on the back of Kennedy's head, Baden then backed down, insisting he had no recollection of their claiming as much in their reports, and no explanation for a fragment on the back of Kennedy's head. This, of course, is in opposition to his testimony, where he claimed part of the bullet rubbed off upon entrance. Perhaps more problematic, however, is this: if Baden had been reminded of the radiology reports in 2000, why did he go back to ignoring them when speaking at the Wecht conference in 2003? Had he grown to disavow the reports he'd once placed into evidence? Or did he fail to respect the doctors with whom he'd been speaking in 2000, and forget everything they'd told him the minute he was out the door?
3. Baden's contempt for the original autopsists is also apparent. Here, he claimed that Dr. Humes destroyed the notes containing the autopsy measurements *before* writing the autopsy protocol, and that Humes just guessed at the measurements in the protocol. Humes had testified to writing the autopsy protocol on Saturday. He'd testified to burning his blood-stained notes on Sunday. Baden's claim was therefore without merit. Baden then used this total fabrication about Humes' purported fabrication to explain how Humes could be so wrong about the entrance wound location.
4. There is a problem with this, of course. Dr. Finck, a forensic pathologist with some experience with gunshot wounds, repeatedly confirmed that the entrance wound was by the EOP, where Dr. Humes claimed it was, and not 10 cm higher on the skull, where Dr. Baden's mentor Dr. Fisher had claimed it to have actually been located. This made Dr. Finck an obstacle to be overcome.

It's disappointing but not surprising, then, that in this discussion, Dr. Baden repeatedly misrepresented Dr. Finck's 1978 testimony to Dr. Baden's panel. Dr. Baden said Finck had told him *"I'd never done a God damn autopsy!"* and that Finck *"just stood and watched. That's what he testified to. He said 'I had no expertise to tell anybody what to do.' He had never done a gunshot wound autopsy before. He didn't know what to do."* Dr. Baden then asserted that the blood in Kennedy's hair had confused poor Finck, and had led him to believe the entrance wound was 4 inches lower on Kennedy's head than it really was. A transcript exists, of course, of Dr. Finck's testimony before the HSCA. He said nothing remotely similar to what Dr. Baden told the researchers Finck had told him. In fact, the transcript proves Baden to be mistaken on most every point. Not only had Finck told Baden he'd performed gunshot wound autopsies before, he'd told him he'd arrived at the autopsy after Kennedy's scalp and hair had been reflected from Kennedy's skull. So much, then, for Baden's claim he'd been confused by Kennedy's hair. Finck told Baden, moreover, that he then stepped up and inspected Kennedy's wounds and made sure certain photos were taken of the entrance wound low on Kennedy's skull. Well, this completely destroys Dr. Baden's claim Finck told him he'd *"just watched"* as well.

It seems more than a coincidence, for that matter, that the recording of Dr. Baden's interview of Finck proves both that Finck held his ground with Baden--by refusing to concede that the entrance wound was really in the cowlick--and that Dr. Baden subsequently misrepresented Finck's statements in a manner suggesting Finck had acquiesced and admitted his incompetence. Dr. Baden's "mistakes" in this discussion, then, suggest that he is either a brazen liar, or somewhat delusional, and capable of believing whatever he'd like to believe.

Or maybe he was just old... He was 65 in January, 2000, scarcely a dinosaur but most definitely a senior...

Nope, not going for it. A quick review of Baden's 9-7-78 HSCA testimony shows that he'd told the House Committee: *"Some people assume authority and upon others authority is thrust as happened to Dr. Humes. He was later to become president of the American Society of Clinical Pathologists. A well experienced hospital pathologist in the scheme of things, he had not been exposed to many gunshot wounds and had not performed autopsies in deaths due to shooting previously: **neither had the other autopsy pathologists present.** So they were required to do an autopsy that by experience and by the way our society is structured in the United States, is reserved for forensic pathologists and coroner's pathologists. As a result of that, certain things didn't happen."*

He had thereby testified before congress that Dr. Finck had never performed an autopsy for a death due to shooting, and that Finck was not a forensic pathologist on 11-22-63. Well, as we've seen, this just wasn't true. Even worse, Baden knew this wasn't true when taking Finck's testimony on 3-12-78, less than 6 months before testifying before congress and telling them the opposite. Hmmm... Could it be that Baden's latter-day mistakes are not just reflections of his having a bad long-term memory, but are, instead, reflections of his never having grasped the facts in the first place?

Let's keep digging and see...

Baden's Reign of Error 1994

A January 16, 1994 column in the Schenectady New York Daily Gazette on the premiere of Dr. Baden's upcoming HBO program "Autopsy" offers a few choice comments by Baden on his experience with the HSCA. Amazingly, Baden claims that although numerous mistakes marred Kennedy's autopsy, *"what we found was that the mistakes made in the Kennedy autopsy were ones that were commonly made in*

all autopsies in 1963." This is incredible. He can't possibly believe it was "common" for a team of doctors, including a forensic pathologist, to claim a bullet entered low on the skull, when it really entered 4 inches higher, and then repeat this claim TWICE after reviewing the autopsy photos and x-rays. He can't possibly believe, furthermore, that it was "common" for such an incorrect claim to be confirmed by a number of other witnesses to the autopsy, and for not one witness to recall seeing a bullet entrance where he claims it to have actually been located. It's also hard to believe Baden honestly believes it was "common" for pathologists to describe a wound as an exit in their autopsy report that they never even probed, or recognized as a bullet wound--as was done with Kennedy's throat wound. Perhaps then Dr. Baden was thinking of the autopsists' errors of omission--such as their not removing the neck organs, or their failure to weigh the brain before the supplemental autopsy--when he said the mistakes at Kennedy's autopsy were "common." If he was really trying to push that it was "common" for a team of doctors to misrepresent a wound's location to the extent he believes the entrance on the back of Kennedy's head was misrepresented, after all, one is left with the unsettling probability Dr. Baden was blowing smoke and trying to deceive the public.

Baden's Reign of Error 1993

A January 24, 1993 AP article (found in the New York Daily Gazette) shows that Dr. Baden had just made an appearance at Hobart and William Smith Colleges, and had decided to take the opportunity to publicly denounce Oliver Stone's film JFK. He is quoted as saying *"The bottom line is: the Warren Commission got it right...It was two bullets from behind, and only two bullets that struck the President. Oliver Stone got it wrong."* He also, however, took this opportunity to trounce those performing Kennedy's autopsy. The article continued: *"Baden said the congressional panel found that the doctors who did the autopsy of Kennedy had never done a gunshot autopsy before."* Well, this, as we've seen, wasn't true. But it gets worse. The article continued *"'A lot of things were done wrong' in the Kennedy autopsy, Baden said. 'They made a lot of foolish mistakes.' Those mistakes included inaccurate measurements and drawings and initial confusion over whether the bullet wounds were exit wounds or entrance wounds. That confusion fueled much of the speculation that the president had to have been shot by more than one gunman, Baden said."*

Well, that's just hooey. The autopsists' initial appraisal of the wounds as to entrance and exit were the same as Baden's final conclusions. Perhaps, then, he was confusing the autopsists at Bethesda with the emergency room doctors at Parkland Hospital. And what *"measurements and drawings"* was he talking about? If he meant those regarding the head wound, well, then, he was at least being consistent with the findings of his panel. But, if he was alluding to the government's former position holding that the location of the back wound on the face sheet had been in error, and had innocently contributed to the belief there was a conspiracy, well, then, he was repeating a factoid long pushed by men like Fisher and Lattimer, and had in the process disputed his own finding supporting that the location of the mark on the face sheet was accurate.

That Baden was more interested in pushing his own agenda, and selling his own wares, than in making accurate statements, moreover, is suggested by another passage in the article: *"Baden said he doesn't believe that the incompetence of the original medical examination of Kennedy was part of a cover-up. 'As much error as there was, that's still what's going on in this country in most murder cases,' he said. 'The tragedy to me about JFK isn't that this was a sinister plot that's been covered over, but that the way the investigation was done is the usual way murder investigations are done in this country.'"*

It's interesting that here, in 1993, Dr. Baden told a crowd that the mistakes made by Kennedy's autopsists were the usual kind of mistakes still made in this country, and that the next year, in 1994, he specified that the mistakes made by Kennedy's autopsists were common mistakes in 1963. Perhaps,

then, he'd realized that his earlier statement had been a gross overstatement. Or maybe, just maybe, he'd actually believed there had been a tremendous improvement in the quality of autopsies performed in the year 1993. With him, it's hard to say.

Baden's Reign of Error 1989

In his first book, *Unnatural Death*, published 1989, Dr. Baden presented a chapter on the Kennedy assassination. One might think that Dr. Baden, concerned about his reputation, would be sure to make his book as accurate as possible, and review the reports and findings of the House Select Committee before committing his thoughts for posterity. But one would be wrong. Among Baden's claims:

1. Those who believe the back-and-to-the-left movement of Kennedy's head after frame 313 indicates the shot came from the front are mistaken because *"They left out of their calculations the acceleration of the car Kennedy was riding in. Beyond that, the body simply does not react that way. The force of the bullet would just as likely cause Kennedy's head to move forward as backward. It's not predictable."* (A quick look at the Zapruder and Nix films shows that the acceleration of the limousine came after the back-and-to-the-left movement of the President's head. This is not just the opinion of conspiracy theorists. Dr. John Lattimer noted as much in his 1976 article in *Surgery, Gynecology, and Obstetrics*. In addition, Baden's claim that the movement of a head is unpredictable is either something he just made up because it sounded good...or was a misrepresentation of Dr. Olivier's testimony for the Rockefeller Commission, in which he claimed that the direction in which *a goat's body* fell after being shot in the head is unpredictable.)
2. *"No forensic pathologist has ever examined the body of the President."* (As we've seen, one of the three doctors performing Kennedy's autopsy, Colonel Pierre Finck, was a licensed forensic pathologist on November 22, 1963.)
3. *"Colonel Finck, it turned out, had never done an autopsy involving a gunshot wound, either."* (As we've seen, Dr. Finck testified about his prior experience on 3-11-78. As a direct response to a question from Dr. Baden, Finck said he'd performed autopsies on gunshot wound victims prior to 1959. Apparently, Dr. Baden didn't note his answer.)
4. *"The FBI photographer, who had clearance, was in the same quandary as Humes. He had never taken autopsy pictures before and was untrained in photographing gunshot wounds."* (As previously discussed, John Stringer, the actual photographer, was a civilian working for the Navy, and had been Bethesda Naval Hospital's chief autopsy photographer for years. His work had been featured in textbooks.)
5. *"The Kennedy head bullet was found on the floor of Kennedy's car in front. It had struck the windshield strut and broken in two."* (Since bullet fragments are smaller and lose their energy much more rapidly than intact bullets, it seems doubtful that two fragments of a bullet breaking up upon entrance on the back of the skull would traverse the skull and exit with the force necessary to crack a windshield and dent a windshield strut. This is in keeping, moreover, with the report of Baden's pathology panel, which observed that the large defect apparent at the supposed exit suggested the exit of a fragment the combined size of the recovered fragments. So it's not exactly surprising that Baden would try and claim the bullet exited intact and broke up after striking the windshield strut. The problem, as discussed above, is that HE SHOULD KNOW THIS ISN'T TRUE. Not only does he overlook that a fragment struck and cracked the windshield in addition to the strut, but he ignores that the two fragments found in the front seat were the nose and base of the bullet, and that they comprised only about half of the bullet. As much of the middle of this bullet was supposedly left in the skull, including the "slice" of bullet seen on the x-rays and interpreted by Baden and his panel to be on the back of the head by the

bullet's entrance, it follows then like night from day that these fragments exited separately and did not break in two upon impact with the windshield strut. Baden's pretending that it did and that the "slice" just fell out the back of the bullet and clung to the back of the skull is bizarre beyond belief.)

6. Dr. Humes burned his notes on November 23, the day after the shooting, before talking to Dr. Perry and finding out the tracheotomy incision had been cut through a bullet wound, and before starting work on the autopsy report. (This may be Baden's most egregious "mistake." Its existence reveals that as early as 1989 he was looking for ways to explain to his readers how Humes could be so mistaken about the location of the entrance wound on the back of Kennedy's head--and that he was willing to make stuff up to do this. There is simply no evidence supporting Baden's version of these events. Humes testified before the Warren Commission that he called Dr. Perry on the morning of the 23rd, began working on the autopsy report later that evening, and burned his notes the next day. He repeated this testimony, moreover, to Baden himself, when meeting with members of Baden's panel on 9-16-77. Shame, shame, shame.)
7. The Cortisone that Kennedy was taking for his Addison's disease *"causes odd fat deposits--an upper back hump, full cheeks. Kennedy had them both, but Addison's disease is not mentioned in the autopsy report."* (As discussed, the "back hump" or "hunchback" story is a disgusting fairy tale started by Dr. Lattimer to help explain how a descending bullet could enter Kennedy's shirt and jacket inches below his shirt collar and still exit from his throat.)
8. *"Perhaps the most egregious error was the four-inch miscalculation. The head is only five inches long from crown to neck, but Humes was confused by a little piece of brain tissue that had adhered to the scalp. He placed the head wound four inches lower than it actually was, near the neck instead of the cowlick."* (This, of course, is nonsense. Baden must have known that Dr.s Humes and Boswell didn't just observe this wound on the scalp, but on the skull after the scalp had been peeled back. He also would have to have known their observation was confirmed by Dr. Pierre Finck, arriving after the beginning of the autopsy. He also should have known their "too low" location was confirmed by several other witnesses to the autopsy, including autopsy photographer John Stringer. His attempt, then, to make this "egregious error" appear to be the error of one man, and not many, and his failure to tell his readers that these witnesses verified this location numerous times, can only be viewed as deceptive.)
9. *"For the head wound, we enhanced the x-rays and saw the entrance perforation on top of the cowlick."* (This would be news to the HSCA's radiology consultants, Dr.s McDonnell and Davis. Neither of them noted such an entrance in their reports. While they both concluded there was an entrance in this location, they did so based upon their observation of fractures and fragments in the area, NOT because they saw an entrance perforation. This distinction is an important one that Baden should not have forgotten.)
10. That when inspecting the photos of the head wound *"Pictures of the wound yielded more when viewed through a stereopticon. In three dimensions they showed the oblique lines (beveling) on the bone in the back of the skull that an entering bullet makes."* (As discussed, this was never mentioned in Baden's testimony before the HSCA. It was mentioned but not demonstrated in his panel's report. Despite plentiful opportunities, no one has demonstrated it in all the years since.)
11. *"The trace metal content in the bullet found on the stretcher and the fragment from Connally's wrist match perfectly. It was a copper-jacketed military bullet with a core of 99 percent lead and insignificant amounts of strontium, arsenic, nickel, platinum, and silver. As small as they are, these traces are like fingerprints."* (The magic bullet and the wrist fragment failed to match on copper, and barely matched on antimony. It also matched on silver, as did half the bullets tested. Protocols of the time dictated that, if a sample failed to match on one of these three, the samples did not match. Therefore there was no match, let alone a perfect match. None of the other elements listed by Baden were even tested.)

12. That when he inspected Governor Connally's back wound he saw *"a two-inch long sideways entrance on his back. He had not been shot by a second shooter but by the same flattened bullet that went through Kennedy."* (Dr. Baden wrote a memo on this inspection for the HSCA. At that time he reported Connally's scar as 1 1/8 inches long. His description of CE 399 as "flattened" is another exaggeration. Only the base of the bullet was slightly flattened.)

As you can see, this trip down the lane of Baden's memory reveals that, over time, he's latched onto a lot of myths, and forgotten a lot of evidence. He repeats the same old canards over and over. "So what?" you might say. "By 2008 Baden was an old man. By 1989, when *Unnatural Death* was published, he'd already been away from the case for ten years. Of course, he made some mistakes. What does that have to do with the accuracy or inaccuracy of his initial investigation for the HSCA?" Well, what if the evidence suggests that Baden didn't forget all that much about the case, and that the real problem is that he never KNEW that much about the case? That's right. Beyond his testifying with his autopsy photo upside down, beyond his falsely testifying that Dr. Humes had testified to finding a beveled exit on the intact skull, beyond his falsely testifying that Dr. Finck was not a forensic pathologist and had never performed an autopsy on a gunshot victim, there's additional evidence that he was simply ignorant of the basic facts he was charged with investigating.

Baden's Reign of Error 1980

In January 2008, on the JFK Lancer website, researcher Randy Owen posted a transcript of a seminar conducted by Dr. Baden in Toronto, Ontario, in November, 1980. November 1980 was but 2 years after Dr. Baden testified before the HSCA, and but a year and some months after the printing of his panel's report. He was but 46 years old, discussing a case he had worked on from when he was 42 until he was 44. And yet...he was already making tremendous mistakes.

1. When discussing Abraham Zapruder and his film, he stated: *"He's retired on the proceeds of the few seconds of film taking."* (While Zapruder made a nice sum from the selling of his film to Time/Life, he was already a successful businessman before selling his film. Furthermore, he'd been dead since 1970. This was the kind of fact that was common knowledge to those with a genuine interest in the case.)
2. When discussing the President's movements after the head shot, he stated *"Interestingly, the Secret Service people indicate that immediately, as soon as they heard the first shot, they speeded up the car. This became a problem because in the whole analysis, it did appear that if he did speed up his car immediately, it had significance."* (The limo's driver never said he sped up after the first shot. He said he looked back after what he thought was the second shot. The films reveal that the car slowed as he looked back, and only accelerated after Kennedy had been hit by the head shot.)
3. Baden then attacked the lack of specificity in the autopsy report, noting: *"The doctors who attended the President made a note that 'the injuries to the skull and brain are so complex that they defy description and we will rely on photographs taken to better describe the injury.'" (The statement to which he refers makes NO mention of the brain at all. It reads "The complexity of these fractures and the fragments thus produced tax satisfactory verbal description and are better appreciated in photographs and roentgenograms which are prepared."* Could Baden really have forgotten that the doctors, while failing to section the brain and inspect the missile paths within the brain, nevertheless described in detail the apparent damage to the surface of the brain in their Supplemental Autopsy Report of 12-6-63? If not, was it a coincidence that Baden failed to acknowledge that the damage described in this report was inconsistent with his re-interpretation of the President's wounds?)
4. He then explained why the doctors' reliance on the photographs made his job so much harder.

He claimed: *"It turns out the photographs taken were out of focus and are of little value because they were not done by medical photographers but by government officials who had never taken autopsy photographs before."* (Holy smokes! The autopsy photographer was, according to Baden, a "government official" in 1980, an FBI photographer in 1989, "somebody else" in 2003, and a Secret Service photographer in 2008. What will he be in 10 more years, an IRS agent performing an audit? Baden's inability to grasp or admit that the pictures were taken by John Stringer, the Navy's top autopsy photographer in 1963 and a man interviewed for the HSCA on August 17, 1977 by HSCA counsel Andy Purdy, Baden's contact with the committee, demonstrates beyond any doubt that he never quite got a handle on the evidence he was tasked with studying.)

5. Baden then explained that it's not a doctors' job to decide who did it. He then told the audience who did it, injecting: *"Oswald had the gun, it was his, there were his fingerprints on it, he pulled the trigger."* (Of course, there'd been but one identifiable print found on the rifle--Oswald's palm print--and it was found on the barrel of the rifle, in a part that was only exposed when the rifle was disassembled. Furthermore, the only man to see this print on the rifle, Dallas detective J.C. Day, felt sure that this print was an old print. Thus, there was no scientific evidence that Oswald had *"pulled the trigger"*.)
6. Baden finally ended his presentation by pointing out the convergence of factors leading to the disappearance of Kennedy's brain before it could be studied. Not surprisingly, he found a way to blame it on the Kennedy family. He asserted *"the x-rays, the specimens, all remained in custody of the Kennedy family. Like somebody is shot in Toronto or New York and the next of kin, who may be the perpetrator, says 'I want my pathologist to come in and do the autopsy. You take the pictures but give me the pictures so I can hold onto them.' And they kept the whole thing. This was done with good intent and all that..."* (He completely left out, if he even knew, that the autopsy materials were not given to the Kennedy family until 1965, long after the Warren Commission had completed its investigation. He also omitted that the Johnson Administration, when it asked for the return of the materials in 1966, only asked for the autopsy photos and x-rays, and never requested the return of the brain for study.)

From all these mistakes it seems clear that Baden was never truly an expert on the case. Not even close. But, to be fair, neither were the other members of his panel.

The Remarkable Dr. Spitz

In his book *Medicolegal Investigation of Death*, Dr. Werner Spitz makes the unusual claim that entrance wounds made by high-powered rifles do not "materially differ" from those made by handguns. He presents the photo at left to demonstrate this point. Sure enough, the wound resembles a typical handgun entrance wound, as seen below.

Curiously, however, he does not cite the distance from which the bullet creating this wound was fired. He then draws attention to this by noting that the wound in the photo at left was created by a high-powered rifle fired from 60 ft. away from the victim. Strangely, this entrance wound more closely resembles the supposed exit on Kennedy than the red oval in the cowlick which Spitz purports to have been the entrance (as seen on the autopsy photo at right). Also strange, the drawing of this autopsy photo presented in Spitz's book (as seen at above right) omits the possible entrance (by the red arrow) as well as the large exit (by the blue arrow). Was Dr. Spitz hiding something from his readers?

The Remarkable Dr. Spitz

Let's take, for example, Dr. Werner Spitz. Dr. Spitz had not only co-authored a prominent forensic pathology textbook, *Medicolegal Investigation of Death*, with Dr. Fisher of the Clark Panel, but he'd been Dr. Fisher's protege at the Maryland State Medical Examiner's office, and had been a colleague of the Clark Panel's Dr. Morgan at John Hopkins University. He'd also been a member of the Rockefeller Commission's medical panel, and had confirmed Fisher and Morgan's findings. His subsequent show of support for the Clark Panel's findings through the conclusions of the HSCA Forensic Pathology Panel, and through his subsequent comments, should then come as no surprise.

His appearance on the HSCA Panel, however, was a bit of a surprise at the time. According to an extensive article on the HSCA's investigation, published in the July 1979 issue of *Gallery*, the HSCA had specifically requested that members of the pathology panel be "noncontroversial." This was almost certainly a dig at Dr. Thomas Noguchi, a "coroner to the stars" in Los Angeles, who'd been heavily criticized and investigated. But this should also have meant Spitz's banishment, seeing as he'd spent much of the 2 years between his stints on the Rockefeller Commission Panel and HSCA Panel at the center of a criminal investigation, which, while not leading to an indictment, nevertheless confirmed that he'd 1) set up a private medical institute while working as Wayne County, Michigan's Chief Medical Examiner, which operated from the county's morgue, and used county employees and

equipment, without reimbursement; 2) removed 7,000 pituitary glands from cadavers passing through the county's morgue, which he resold at a profit to his institute; 3) resold blood, brains, and urine from a number of cadavers in the morgue, at a profit to his institute; 4) conducted autopsies on infants as part of a state-wide study on crib death, which were reimbursed by the state to his institute, even though county employees and equipment were used; and 5) fired weapons on cadavers in the county morgue in order to test their wounding patterns, without receiving permission from the families of the cadavers, or the county.

It is presumed then that someone, almost certainly Dr. Baden, intervened on his behalf.

They certainly appear to be birds of a feather. Since his stint on the HSCA panel, Spitz, as Baden, has made numerous suspicious and inaccurate statements about the Kennedy assassination medical evidence. These mistakes, moreover, suggest that Spitz, as Fisher, was less than forthcoming on what the evidence suggests, and that Spitz, as Baden, never took the time to study the case.

In his book's chapter on gunshot wounds, Spitz claims *"In the case of a high-powered rifle, the external appearance of the entrance wound does not materially differ from that of a gunshot wound inflicted with a handgun or an ordinary rifle."* To demonstrate this point, he makes reference to a photo showing a small entrance wound on the back of a head, closely resembling the supposed entrance near the cowlick on the back of Kennedy's head. Notably, he does not identify the type of rifle fired nor the distance from which it was fired. He then proceeds to describe the massive internal damage created by such a bullet. For this he makes reference to another photo. Only this one shows a massive wound on the top of the head, closely resembling what is supposedly the exit on Kennedy's head. The caption for this photo, however, explains *"Shot from a .30-.30 rifle fired from about 60 feet. The wound of entrance is indicated by arrows."* The large size of this entrance, of course, DOES "materially differ" from that of a gunshot wound inflicted by a handgun, and this, in turn, raises the question of why the distance of the shot in the first photo was not noted.

Spitz's caginess on this issue is no one-time thing, mind you. On 11-17-88 Dr. Spitz defended the Warren Commission's findings on Detroit radio station WXYT. When asked about the President's head wounds, he was most forthcoming. He asserted: *"The right upper quadrant of the head was more or less demolished. It is not unusual for a high-powered rifle to do this. A mistake was made insofar that the the back of the head was never shaved. There is every reason to believe that the entrance wound was up toward the top of the head namely in the area of the cowlick. The hair in that area, due to the peculiar way in which the hair turned like in a whirlpool--the skin is a little bit more visible in that area than in other parts where the hair is combed over. That bullet hole--if it is a bullet hole--looked very very suggestive of a regular usual bullet wound of entrance like we see thousands of. It is known--and we have seen this many many times--that high-powered rifles, whereas they cause lots of damage at the exit, cause a bullet wound of entrance which does not look any different from any other bullet wound of entrance, even from a small caliber handgun."*

Well, my gosh, by gosh... This is utter hogwash! Spitz's suggestion that the entrance wounds created by high-velocity rifle bullets on the skull at distances as short as 100 yards are identical in appearance to the entrance wounds created by low-velocity small-caliber handgun bullets on the skull is only refuted by most every book or article on wound ballistics ever written (save his own).

I mean, something is just strange here. Spitz does not designate "high-powered rifles when firing military ammunition" or any such thing. He says simply "high-powered rifles." The explosive effects of hunting ammunition at both entrance and at exit when fired by a high-powered rifles has long been noted. Spitz, furthermore, would have been far more familiar with this kind of high-velocity rifle wound than he would have been with the wounds normally created by Oswald's rifle. There is simply no way he could have forgotten the nastiness of such a wound, or be of the belief that small-caliber

handguns when fired from a distance could create wounds equally as nasty. The high-powered rifle firing soft-nosed hunting ammunition tested in The Discovery Channel's 2008 program JFK: Inside the Target Car, we should remember, completely exploded the first simulated human head fired upon in the program, and severed it from its neck.

Let's reflect... Handbook of Legal Medicine, by Dr. Alan R. Moritz, the mentor to Dr. Spitz's mentor, Dr. Fisher, and a member of the Clark Panel, reports: *"Rifles or carbines manufactured for big game hunting or as military weapons ordinarily use ammunition with a large powder charge to ensure high velocity and long carrying distance. The kinetic energy of such a projectile may be so great as to have an explosive effect on impact quite different than that produced by most pistols or revolvers or by rifles designed for small game hunting. Regardless of the range of fire, the explosive effect of such a bullet at the site of entrance may be great enough to make it difficult to recognize just where the bullet struck and whether it was entering or leaving the body at that place."*

And Dr. Moritz was far from alone. Forensic Pathology, a Handbook for Pathologists, edited by Spitz's close colleagues Dr. Fisher and Dr. Petty, confirms: *"Wounds from revolvers, pistols, and rifles will have characteristics which vary depending on the velocity of the bullet (which is the largest factor determining the destructive energy)...Increasing the velocity of projectiles increases geometrically the quantity of energy produced and this produces perforating wounds with unusual features: bone may literally be pulverized, soft tissue laceration may be widespread and at considerable distance from the track of the projectile, lacerations may be observed within the intima of arteries; exit wounds may be unusually large."*

As these "unusual features" are related to the velocity of the bullet, and the velocity of the bullet is greatest at entrance, it makes no sense whatsoever for Spitz to imply these features would go unnoticed at entrance.

There's also this... The HSCA Forensic Pathology Panel, of which Spitz was a senior member, concluded that a high-velocity bullet had struck Kennedy high on the back of his skull. To this end, when discussing Kennedy's x-rays and an obviously displaced section of the rear of his skull, the panel's report described: *"embedded in the skull in the lower region of this defect is a radiopaque shadow which, in the opinion of the panel, is a fragment of the missile."* As the nose and base of this bullet were found on the front seat of the limousine, moreover, it follows that this fragment could only have come from the middle of the bullet. This means that, in the panel's expert opinion, the bullet broke up upon entrance. (Dr. Baden, of course, made several statements indicating that he thought the "radiopaque shadow" rubbed off the base of the bullet, and that the bullet itself broke up upon hitting the windshield strut, but this makes no sense whatsoever, and one cannot reasonably presume the rest of the panel was as daft as he on this issue.)

If a high-velocity bullet had broken up upon entrance to the skull, well, it only makes sense that the appearance of this entrance would not be that of a "regular usual wound of entrance." Yes?

I mean, this isn't just some layman making stuff up; this is what EVERY doctor to write about gunshot wounds, including Spitz's colleagues, has claimed.

So why did Spitz, regularly and repeatedly, imply that the entrance of a rifle bullet on the skull looks like the entrance of a handgun bullet on the skull? Was he trying to cover up that the supposed entrance to Kennedy's skull in the cowlick could pass for being a handgun wound, but bore scant resemblance to the kind of massive wound one would expect from a high-velocity bullet, fired from less than a hundred yards away, and fragmenting on the skull?

Perhaps Spitz was just confused. Perhaps he had remembered that, under certain circumstances, a handgun wound can give the appearance of a rifle wound. According to Moritz, *"If the muzzle of the*

gun was in close contact with the skin at the moment of firing, a large entrance wound may be produced by the explosive effects of the expanding gases in the tissues. Similar destructive effects may result from the impact of a high velocity bullet such as those fired from most military rifles, machine guns, and some sporting guns." Unfortunately for Spitz, though, this is a one-way street. While holding a muzzle to the body can make a handgun wound look like a rifle wound, there is no reason, outside the bullet's having been fired from hundreds (or in some circumstances, thousands) of yards away, that a high-velocity rifle wound of the skull would look like the "regular usual" wound made by a handgun of small caliber.

Or perhaps Spitz was ill-informed. By the 1980's, much had been made of the M-16's mechanism of wounding, whereby it left small wounds at entrance on the body but created massive internal damage as a consequence of the bullet's tumbling and breaking up inside the body. Perhaps Spitz was of the misguided belief then that the impact of a 160 grain bullet on a skull would bear the same resemblance to a small caliber handgun bullet on a skull as the impact of a 55 grain M-16 bullet would on a body to a small caliber handgun bullet on a body. Perhaps Spitz, who in daily life had seen far more handgun wounds and shotgun wounds than rifle wounds--by a ratio of probably 100 to 1--had simply failed to realize that the bullet striking Kennedy was far larger, and would have behaved much differently, than the M-16 bullet of so much discussion.

Or perhaps, just perhaps, Dr. Spitz was being deliberately deceptive about the nature of high-powered rifle wounds to conceal that the entrance wound proposed by his friend Fisher, and confirmed by not one but two panels on which he himself resided, was most certainly not the entrance of a high-velocity bullet fragmenting on the back of the head. Dr. Spitz had, after all, told the Rockefeller Commission in 1975 that he'd performed *"high velocity rifle test firings for the sake of learning their effect,"* but that he had never published his results. The possibility that Dr. Spitz was being deliberately deceptive is supported as well by the strange fact that he subsequently published a drawing of the autopsy photo of the back of the head in his book, and that this drawing not only failed to depict the small dark shape present in the entrance location described by Dr. Humes, but the surprising wing of scalp apparent by Kennedy's temple, signifying the supposed exit of the bullet.

Perhaps, perhaps, perhaps...

But Spitz's apparent failure to appreciate or acknowledge that the entrance wound on the back of Kennedy's head should not have appeared to be a "regular usual wound" was not his only "mistake." Nor his strangest...

As hard as it may be to believe, in recent editions of *Medicolegal Investigation of Death*, Spitz makes an even stranger mistake. He writes *"One of the gravest errors made in the autopsy of President John F. Kennedy was the fact that the back of the head was never shaved. Thus, to this day, speculation and innuendos persist regarding the exact location of the wound, and some even claim that this shot came from the front or the grassy knoll, at the right side of the President's motorcade, suggesting a conspiracy by at least two assassins."*

Well, this is, as promised, strange. The "speculation and innuendos" holding that Kennedy was shot from the front have nothing to do with the failure of the autopsy doctors to shave the back of Kennedy's head, and have everything to do with the statements of the emergency room doctors in Dallas. I mean, does Spitz really mean to imply that the autopsy doctors might have found the wound on the back of the head described by the emergency room doctors, if only they'd shaved Kennedy's head? The only doctor in Dallas to inspect the head wound, Dr. Clark, specified that there was no scalp over this large gaping wound, so how could there be hair?

The thought occurs then that Dr. Spitz knew full well that the failure to shave Kennedy's head had nothing to do with the widespread belief the head shot was fired from the front, but was being cute

about it. Was he trying to avoid mentioning that the descriptions of the head wound by the doctors in Dallas placed it in a different location than the descriptions of the head wound by the doctors in Bethesda, and that the panel on which he served concluded that each of these groups of doctors incorrectly recalled the location of the wounds they observed?

Perhaps. An article on Spitz found on the Wayne State University website confirms his feeling that the failure to cut JFK's hair led to some major mistakes. The author of this article, Amy DiCresce, explains *"Part of the confusion and chaos over Kennedy's death was the inaccurate original autopsy report, but Dr. Spitz says there's a simple explanation for that. Kennedy was autopsied by a pathologist who had never done a gunshot autopsy before. Furthermore, he points to his head saying, 'To this day, we don't know if the bullet entered exactly here or here. The wound was never shaven. You should never make a determination on a bullet wound without cleaning it and photographing it properly. It's the only way you can see the details.'"*

Well, this is better, but still not good. While in his book Spitz insinuated that the failure to shave Kennedy's head had prevented the autopsy doctors from convincing others there was no exit on the back of the head, he at least now acknowledges that this failure, if anything, led to Dr. Humes inaccurately measuring the entrance wound location. But who is he kidding? The failure to shave Kennedy's hair could never in a million years have led Dr. Humes--and his entire autopsy team--to think the top of Kennedy's skull--where Spitz claims the wound was actually located--was the BOTTOM of Kennedy's skull--where Humes and his entire autopsy team claimed the wound was located. No, the only ones actually confused by Humes' failure to shave Kennedy's head were those tasked with subsequently studying the autopsy photos--men like Dr. Fisher...and Dr. Spitz.

And Spitz is well aware of this... Let's recall that he told his radio audience in 1988 that *"There is every reason to believe that the entrance wound was up toward the top of the head namely in the area of the cowlick. The hair in that area, due to the peculiar way in which the hair turned like in a whirlpool--the skin is a little bit more visible in that area than in other parts where the hair is combed over. That bullet hole--if it is a bullet hole--looked very very suggestive of a regular usual bullet wound of entrance like we see thousands of."*

"That bullet hole--if it is a bullet hole..." Spitz had thereby let it slip that he wasn't exactly sure about the so-called cowlick entrance and, in the process, had suggested that his anger toward the autopsists for not shaving JFK's head was related as much to his own difficulty in interpreting the autopsy photos as anything else.

An April 3, 2005 article in the Macomb Daily, based on an interview with Spitz, supports this speculation, and suggests that Dr. Spitz continues to search for someone--anyone--to blame for his frustration. The article quotes him as follows: *"Jackie was upstairs in the hospital and sent down an order not to cut any hair."*

Hmm, this detail about the First Lady is quite a revelation... but is apparently untrue. In 1992, when interviewed in the Journal of the American Medical Association and given the chance to explain all the shortcomings of Kennedy's autopsy, head autopsist Dr. James Humes proclaimed *"The wounds were so obvious that there was no need to shave the hair before photographs were taken."* As far as can be determined, Humes never wavered on this point. As a result, we can only suspect the story about Mrs. Kennedy ordering the hair not be shaved was someone's invention. Someone named Dr. Werner Spitz...

But, as awful as this is, this is not the worst of Spitz's mistakes, and is not the only thing he has apparently made up for his convenience. In the three editions of *Medicolegal Investigation of Death* released subsequent to his stint with the HSCA, (in 1980, 1993, and 2006) Spitz repeatedly claims *"The*

wound in the front of JFK's neck was circumferentially abraded, resembling an entrance wound to inexperienced examiners at the autopsy."

Yikes. Feel free to read that again... Could Spitz really be suggesting that the autopsy doctors mistakenly concluded the throat wound was an entrance?

Amazingly, yes. A May 13, 2006 article in The Journal Gazette reports that Spitz, while explaining why so many people are of the mistaken belief shots came from the front, *"contended that the original autopsy – done under extreme pressure – erroneously concluded an exit wound in Kennedy's neck was an entry wound because of an abrasion around the wound. That abrasion was likely caused by the knot of the former president's tie, Spitz said, adding that it is not uncommon for clothes pressed tightly against the skin to cause such an abrasion."*

Uhhh, WOW. There's just a few huge problems with this. One is that the original autopsy did not conclude Kennedy's throat wound was an entrance wound. That Spitz not only makes this mistake, but has repeatedly and consistently made this mistake since 1980, furthermore, suggests that HE HAS NEVER ACTUALLY READ THE AUTOPSY REPORT. Two is that there was no abrasion ring around the throat wound noted at autopsy. The autopsy doctors saw only a tracheotomy incision during the autopsy, and thought it was just that, a tracheotomy incision. This suggests, furthermore, that Spitz HAS NEVER EVEN READ THE TESTIMONY OF THE AUTOPSY DOCTORS.

Even worse, the doctors at Parkland Hospital, who did think the wound resembled an entrance before cutting through it with a tracheotomy incision, thought so primarily because of its extremely small size, and never mentioned an abrasion ring in their testimony. This suggests again that Spitz HAS NEVER EVEN READ THE TESTIMONY OF THE PARKLAND HOSPITAL EMERGENCY ROOM DOCTORS. This indicates that Spitz was, well....just making stuff up.

That Spitz refused to actually study the evidence, and preferred to make stuff up, is suggested, furthermore, by his earliest interviews on the subject. The June 2, 1975 edition of Medical World News, written just after Spitz first viewed the evidence for the Rockefeller Commission, boasts on article on the medical evidence, with input from Dr.s Fisher, Spitz, and Wecht. While discussing the fatal head shot, Dr. Spitz claims: *"One bullet entered from the rear of his skull and exited near his right eye."* Near his right eye? As the exit location later identified by the HSCA's Panel is at least three inches from the right eye, this suggests Dr. Spitz was so ill-informed regarding the specifics of the assassination in 1975 that he, as Dr. Angel a few years later, just ASSUMED the "mystery photo" was taken directly from the front, and that the beveled exit in the photo was therefore directly above the eye. He never realized that none of the doctors inspecting Kennedy's body on the day of his death noticed such a wound. And he never realized this because HE NEVER READ THE REPORTS AND TESTIMONY OF THE AUTOPSY DOCTORS AND NEVER READ THE REPORTS AND TESTIMONY OF THE PARKLAND HOSPITAL EMERGENCY ROOM DOCTORS. (Sorry about all the caps...)

One might rightly suspect then that Spitz, as Baden, is simply unreliable, and equally as likely as Baden to repeat half-baked nonsense when discussing the assassination...and assassinations....

Sadly, this suspicion was recently confirmed....

Trust Us, We're The Experts

On 12-27-2007, seven Pakistani doctors examined the body of their country's former Prime Minister, Benazir Bhutto, who'd been assassinated only hours before. Their report on her wounds reads as

follows:

- ***Details OF THE WOUND AND ITS SURROUNDINGS***

- *There was wound in right Temporoparietal region. Shape was irregularly oval, measuring about 5 x 3 cms, just above the pinna of right ear. Edges were irregular. No surrounding wounds or blackening was seen. There was a big boggy swelling around the wound. Blood was continuously trickling down and whitish material that looked like brain matter was seen in the wound and in the surrounding hair. Sharp bone edges were felt in wound. No foreign body was felt in the wound.*
- *Wound was not further explored. Generate aseptic dressing was used to cover the wound.*
- *Bleeding from both the ears was seen, more so from the right ear. Slight trickle of Blood was seen from right nostril also. Blood mixed with secretions was seen in the oral cavity also.*
- *Detailed external examination of the body did not reveal any other external injury.*
- *X-rays of the skull AP and Lateral views were done after she had been declared dead. Findings are as below:-*
- *Comminuted depressed skull fracture involving right temoroparietal bone is observed with inwards depressed fracture fragment measuring approx. 35 mm (on-X-ray measurement). Depressed fracture fragment distant from intact bony skull measures 12 mm from outer to outer skull table & 12 mm from inner to inner skull table. Two to three tiny radio-densities underneath fracture segment are observed on both projections. Associated scalp soft tissue swelling & moderate degree of pneumocephalus is observed. Rest of the bony skull is intact. Radio-opaque dental fillings are evident.*
- ***CAUSE OF DEATH***
- *Open head injury with depressed skull fracture, leading to Cardiopulmonary arrest.*

A Pakistani government spokesman took from this that Ms. Bhutto had hit her head on a handle of her open-topped security vehicle while reacting to the explosion of a nearby suicide bomber. This explanation satisfied almost no one, however. Within days, a number of top American forensic pathologists had joined a growing chorus of doubt and dismay. They couldn't understand why no autopsy had been performed on Ms. Bhutto. They couldn't understand how Ms. Bhutto could incur such a wound, simply by bumping her head. On 12-31-2007, an article appeared in the New York Times, expressing both the doubts of these doctors, and their own theories on the cause of Ms. Bhutto's death. It read, in part:

- *"Dr. Baden said he suspected that Ms. Bhutto died from a bullet that left two or three tiny fragments seen on X-rays before it exited the skull through a wound that the Pakistani doctors did not notice in part because they apparently did not shave the bloodied thick scalp hair." (Note: by conjuring up an imaginary wound of exit, Dr. Baden was acknowledging that he felt the 5 cm by 3 cm wound described by the doctors was most logically an entrance. As it would make little sense for a bullet entrance of such dimension to lead to a bullet exit so small it could be hidden in the hair, moreover, he was giving us yet another reason to doubt his common sense.)*
- *"Dr. Werner U. Spitz, former chief medical examiner in Detroit, said he could not understand why the government did not try to quench "the thirst of the Pakistani people to know the facts, because they are all angry, and if you confronted them with the facts, maybe the anger" would disappear." (Note: this is quite a line coming from a man who participated in not one but two highly-secretive forensic pathology panels investigating the death of President Kennedy.)*
- *"Dr. Spitz said he suspected that Ms. Bhutto died after being hit by a bullet fired from a high-powered rifle." (Note: you've got to be kidding. In 1988, when discussing JFK's head wounds,*

Spitz suggested that the small oval shape by the cowlick in the autopsy photos was precisely the kind of wound one would expect from a high-powered rifle. Now, here, with a wound ONE HUNDRED TIMES as large as the entrance wound measured at the autopsy of JFK, he immediately jumps to "hmm, looks like a high-powered rifle wound to me..." Spitz, by the way, would go on to testify on behalf of Phil Spector in his murder trial, and help accused child-killer Casey Anthony obtain her release after floating that the duct tape found on her daughter's skull was applied after decomposition, and not before.)

- *"Dr. Vincent J. DiMaio, a former chief medical examiner in San Antonio, who also deplored the lack of an autopsy in Ms. Bhutto's case, said he suspected that a fragment that was propelled against her head was a more likely explanation for her death than a bullet wound."* (Note: while not himself a member of the HSCA Forensic Pathology Panel, Dr. DiMaio, along with Dr. Henry Lee, was asked by the ARRB in 1998 to review the newly digitized autopsy photos and determine if there was anything that could be seen in the photos that would lead them to think forming a new pathology panel might prove useful. As Dr. DiMaio had studied under the Clark Panel's Dr. Russell Fisher, and was a long-time colleague of Dr. Spitz, and had co-written articles with Spitz going back at least as far as 1972, and as he had also publicly praised the work of single-assassin theorist Dr. Lattimer as far back as 1973, his selection for this task was highly questionable. According to Doug Horne, who interviewed DiMaio for the ARRB, Dr. DiMaio made it clear before even looking at the photos that he felt the Clark Panel, Rockefeller Commission Panel, and HSCA panel had gotten it right, and *"declared with great certainty"* that the red spot in the cowlick *"was a classic bullet entry wound."* Horne's notes on his meeting with Lee and DiMaio, not surprisingly, reflect further that both Lee, who, along with Baden, had been a well-paid member of O.J. Simpson's defense team, and DiMaio *"felt any visual information now available was not sufficient that a panel would be able to reach any conclusions with a sufficient degree of scientific certainty."* In other words, they refused to give anyone the opportunity to second guess their friends and colleagues, Dr.s Baden and Spitz. Flash forward to 2007. Dr. Baden's wife is one of Phil Spector's attorneys. Not surprisingly, Dr. Baden is a highly-paid witness for his defense. Also not surprisingly, Dr.s Lee and DiMaio--who is reported to have charged \$400 an hour for his efforts--join him on the team, and Dr. Spitz jumps on the money train for the second trial.)

A video of Bhutto's assassination soon surfaced. It showed a man firing a pistol at Ms. Bhutto as she fell into the car, and a violent explosion after she'd already fallen inside. It indicated she was not shot by a rifle, or hit by any shrapnel. Most watching the film believe she is in fact shot by the pistol. Some even go further and speculate that this bullet entered the back of her neck before exiting from the 5 cm by 3 cm defect described in the report of the doctors. A study performed by Scotland Yard, however, failed to support this. It claimed instead that the shots fired at Ms. Bhutto had missed and that, as originally surmised by the Pakistani official, Ms. Bhutto had died after hitting her head. The controversy continues.

The controversy over Ms. Bhutto's death is nevertheless informative. It shows that you can get a report signed by seven doctors that many experts will believe is wrong. It shows as well that you can get three opinions, from three experts, in which the conclusions of these doctors are disputed, and that they also can be wrong. And, finally, it shows that some experts, particularly those affiliated with the HSCA forensic pathology panel, are more than willing to offer up their opinions on controversial cases before obtaining the relevant evidence.

Manufacturing Consensus

If Spitz and Baden were simply wrong about Kennedy, then, it should not be all that surprising. There is simply no evidence the doctors on the HSCA panel ever thought of themselves as anything but

consultants. A consultant will tell you, for a price, what he knows or thinks he knows. An investigator, which is what the committee needed, will tell you what he's discovered after reading everything relevant to the case, and conducting actual research.

A brief study of the events leading up to Baden's testimony suggests that the members of the HSCA Forensic Pathology Panel were just consultants, and low-paid consultants at that. In an article available on the Wayne University website, in which Dr. Spitz discusses his work for the HSCA, he complains *"You know how much I got for that opinion? I got \$121, which paid for the airplane ticket to Washington and back. Otherwise, they didn't give me anything."*

If he was understating his pay, it wasn't by much. On 9-28-78, in the statements of Chairman Louis Stokes before the HSCA (found in the FBI files on the Mary Ferrell Foundation website), at the close of their public hearings, he discussed the finances of the committee. He noted that they'd paid \$25,000 for 101 man-days to their pathology consultants. That's total. For nine top pathologists and a number of radiologists. 101 man-days. That's less than 10 days apiece. This pales in comparison to the \$75,850 and 198 man-days devoted to studying the dicta-belt evidence, and re-enacting the shooting in Dealey Plaza. This is less than half the \$50,000 and 270 man-days spent studying and enhancing the photographs. To put this small number of man-days in proper perspective, one need only consider that, by Stokes' own account, the creation of medical illustrations for the committee took 78 man-days. Since by quick count only seven illustrations were created, this means that the pathology consultants spent approximately as much time evaluating, discussing, and writing about the evidence, per person, as it took the committee's medical illustrator, Ida Dox, to create one drawing.

And what did the pathology consultants do on their 101 man-days, less than 10 days apiece?

Well, they were good enough to tell us in their report. The doctors who'd never seen the autopsy photos and x-rays before, including Dr. Baden, got together at a House of Representatives office on 9-15-77. At this meeting, a number of documents related to the assassination, including official reports, Warren Commission testimony, and articles on the assassination were *"made available."* These documents, mind you, which are listed in the report's addendum A, and which would take a normal person at least a week to read and comprehend, should have been required reading BEFORE the panelists had even set foot in Washington. And yet, they were only *"made available."* There's no mention of photo-copies being passed out for home study. Not that there was much time for home study. They re-convened at the National Archives the next day to inspect the autopsy evidence. On the 17th, they spent some more time with the evidence and met with Dr.s Humes, Boswell, and Angel as well. This is the meeting where Dr. Humes said the "cowlick" entry appeared to be dried blood. This is the meeting where Dr. Angel said the exit was on the frontal bone. (Both of these statements were ignored by the Panel.) On the 18th, this panel re-convened at the House Office Building, to *"discuss the individual findings and commit to writing its opinions relative to the evidence viewed."* Their report explains: *"At that meeting, it became apparent that the members were in substantial agreement with respect to the interpretation to the evidence."* Note that there was no radiologist present to help them analyze the x-rays. Note also that these doctors were civilians and that none of them had studied military rifle wounds, let alone the wounds caused by Mannlicher-Carcano rifles. Note further that the Warren Commission testimony of Dr. Alfred Olivier, who'd studied the wound ballistics of the rifle, and the 1965 report he'd written on his studies, were not included in addendum A, although *"Rockefeller panel reports"*, presumably including Dr. Olivier's own brief report to the Rockefeller Commission in 1975, were included. While Dr. Baden, in his 1980 Toronto speech, would admit that his panel *"knew very little about"* Mannlicher-Carcano ammunition (a fact confirmed in 1986 by panel member Charles Petty, who admitted during testimony in a televised mock trial that he'd never inspected a single wound of its making), and while Baden would later admit to the 2003 Wecht conference audience that *"medical examiners as well as*

neurosurgeons and trauma surgeons, we don't see much in the way of military rifle ammunition" and illustrate this by admitting that a New York City coroner inspecting *"1200 gunshot murder victims"* would probably find that *"none of them"* were by military rifles, he didn't see fit to bring a doctor familiar with this ammunition onto his panel. Instead, as Dr. Baden admitted in 1980, he contacted someone named Tom Marshall to find out more, but failed to provide Marshall the specifics of the case. There is no mention, moreover, of Marshall's opinions in the HSCA's files.

This panel selected Dr. Loquvam to write a report on their findings.

The other sub-panel, made-up of Dr.s Wecht, Spitz, and Weston, who'd previously viewed the autopsy materials, met at the House Office Building on 9-22-77, went to the Archives on 9-23, and re-convened at the House Office Building on the 24th. The panel's report notes that *"The material listed in addendum A was made available to this sub-panel at this initial meeting. The material listed in addendum B was made available at the second meeting at the National Archives. All members of both sub-panels were allowed unlimited access to these materials for individual examination."* This confirms that the materials in addendum A, which should have been required reading, were merely present in the room, and not handed out for study. On the 24th, Dr. Wecht offered a dissenting opinion on the evidence to this panel. As with the other sub-panel, no radiologists or military wounds experts were present during their analysis and discussion. This panel selected Dr. Weston to write a report, reflecting their views.

In retrospect, it certainly seems more than a little suspicious that Dr. Wecht, whose disagreement with the single-bullet theory had long been established, was disenfranchised by the structure of the panel. By having 6 doctors meet and come to a conclusion without his being present, and then having him meet as one of a trio of doctors--where the other two had already committed themselves to supporting the single-bullet theory and that there was evidence for only one gunman--his influence on the panel's conclusions had undoubtedly been minimized. This structure also prevented him from meeting Dr.s Humes and Boswell on 9-17-77, and asking them the questions he'd felt needed to be asked.

On 3-10-78, Dr.s Loquvam, Weston, and Baden met at the Archives to look at some photographic evidence, after which all panel members met with the photographic panel. The next day, the full panel deposited Dr.s Ebersole and Finck, and met with members of other panels to compare findings. Apparently, this was the first time they met with Larry Sturdivan, the HSCA's wound ballistics expert, who just so happened to have been a subordinate to Dr. Alfred Olivier, the Warren Commission's wound ballistics expert. The next day, 3-12-78, they again talked with Dr. Finck. This is the meeting in which Dr. Baden tried to pressure Dr. Finck to agree that the entrance on the skull was in the cowlick. Afterwards, the panel discussed their findings. In Dr. Wecht's dissenting opinion, contained within volume 7 of the HSCA report, he notes that although the report of the first sub-panel claimed they were in *"substantial agreement with respect to the interpretation to the evidence"* after their first inspection of the evidence the previous September, that, during this subsequent meeting, with Wecht in attendance, *"other members of the overall FPP expressed strong differences of opinion."* If so, these differences of opinion were not reflected anywhere in the final report. Instead, the final report holds that the panel came to a number of agreements during this discussion: they agreed that either Dr. Coe or Dr. Petty would continue to work with the photography panel; they agreed that Dr. Weston would represent the panel at a preliminary review of the enhanced photographs and x-rays; and they agreed that Dr. Weston would combine his and Loquvam's reports into a final report. (HSCA Chief Counsel Robert Blakey would later admit to Vincent Bugliosi that Weston's final report was in fact far from final, and that Weston's report was reviewed and re-written by Dr. Baden and HSCA staff members Andy Purdy and Mark Flanagan before undergoing further review and re-writing by Blakey and Dick Billings, a long-time Life Magazine employee hired by Blakey to assist in the writing of the report.)

That's it. This confirms that the bulk of the panel never saw the enhanced photos or x-rays before

coming to their conclusions. This confirms that the bulk of the panel never saw the reports of the HSCA's radiology consultants, Dr.s McDonnell (dated 8-4-78) and Davis (dated 8-23-78 and 12-22-78) before coming to their conclusions. This confirms as well that, when Dr. Baden testified in September 1978, it had been six months since he'd discussed the evidence with the bulk of the forensic pathology panel.

While Baden's lack of familiarity with the case is not a crime, one should expect a lot more from the HSCA's top medical expert, and the man to whom Vincent Bugliosi turned to answer his questions about the medical evidence. One might hold that Baden is a nice man, even a great doctor. But his work on the Kennedy assassination has been, in my opinion, an embarrassment to his profession.

I'm not the first to question his competence. Dr. Baden was asked to head the HSCA panel in 1977. At that time he was but a deputy medical examiner. In August 1978, just before his testimony, however, he was appointed Chief Medical Examiner for the City of New York. He held on to this position all through the hearings. By the next summer, however, around the time the HSCA's report was published, Mayor Ed Koch decided to relieve him of his duty. Early articles on this action reflect that Dr. Baden was accused of, among other things, presenting sordid details on the death of former Vice-President Nelson Rockefeller during a February 3, 1979 lecture at a local hospital. (Baden was reported to have claimed that Rocky had died while fornicating with an aide.) Baden was also accused of losing evidence and being impolite to assistant district attorneys. One early article, in the August 1, 1979 L.A. Times, reflects that Baden conceded that there had been "personality" problems on four cases, and that "In two, evidence problems of a minor nature developed." Baden then turned around and sued both Mayor Koch and the City of New York for his reinstatement. This fight went all the way to the U.S. Court of Appeals, with the Court deciding that Baden's demotion was within his probationary period, and that he was thus not entitled to a hearing before his dismissal. While the ruling on his appeal, available online, makes note of Baden's claim that he was "removed from his position because of the exercise, by him and members of his family, of their right of free speech," a 10-30-87 New York Times article, also found online, claims only that Koch removed Baden "after receiving negative reports from Dr. Reinaldo A. Ferrer, then the city's Health Commissioner, and from Robert M. Morgenthau, the Manhattan District Attorney" and that they "contended, among other things, that Dr. Baden had lost important evidence in homicide cases and had been unresponsive to requests from superiors." A July 9, 1982, New York Times article on Dr. Baden's trial, furthermore, affirms that this was the official reason for his dismissal and quotes Baden's own assessment of his reputation following the revelation of these charges: "I became overnight almost a pariah in my profession because of the nature of the charges against me," he said. He added that the charges had damaged his credibility and "immediately affected my ability to testify in court" as an expert in major homicide cases."

In the interests of fairness, it should be noted here that Dr. Baden, in his 1989 book *Unnatural Death: Confessions of a Medical Examiner*, offers a defense against these charges. He does so, however, at the cost of his profession, and the credibility of his work with the HSCA Pathology Panel. When discussing the difficulties he had getting along with a big city DA like Morgenthau, he writes "What is really wanted is an elastic man, one who will stretch and bend his findings to suit the DA's needs and the political climate. Truth and excellence play no part in this arrangement. Numbers are what count, getting convictions for the DA, and the ME's office exists for that purpose. Its own purposes are always subordinate to somebody else's agenda." He then describes the specific pressure put on Medical Examiners (ME's) to twist the evidence and say that murdered women have also been raped; he reports, to the detriment of the credibility of his fellow pathologists, that "Most ME's do it." He then discusses a number of cases where political pressure influenced the findings of the ME. He later concludes, to the detriment of his profession, that: "In murder, medical examiners who can't figure out the cause of death tend to go along with the police theory. Instead of arriving at their own independent conclusions, ME's

just become rubber stamps. There is nothing deliberately dishonest about this. The police want to solve the murder, and the ME, mistakenly thinking he is there to serve them, adopts their theory." Baden offers no compelling reason for his readers to believe the investigation of a president's murder would be less pressure-packed than the investigation of a possible rape, and no compelling reason to believe the pathologists on the HSCA panel would be less eager to please the powers that be than the ME's described in his book. Perhaps, then, he was trying to tell us something.

Dr. Baden's subsequent career has been no less controversial. The 2006 book *Postmortem*, by Stefan Timmermans, explores the sociology of medical examiners. It received a rave review from the *Journal of the American Medical Association*. In a chapter on the importance of witness credibility, Timmermans discusses Baden's 1997 testimony in defense of Louise Woodward, a nanny accused of shaking an 8-month-old to death. Timmermans recounts how Baden testified on behalf of Woodward that the infant's injuries were not necessarily caused by shaking and may have been older fractures caused by a fall or impact. He testified: "Shaken doesn't explain anything about the autopsy or pathology. That is just speculation. An impact would cause all those injuries." The prosecution was prepared for this, however, and countered Baden's testimony by reading into the record Baden's testimony from a previous trial before the very same judge. When representing the prosecution at this earlier trial, Baden had claimed "from a medical examiner-pathology point of view, it was the hemorrhaging about the brain and eyes that are characteristic and pathognomonic of shaken-baby syndrome." By claiming there were injuries characteristic of shaken-baby syndrome when testifying on behalf of the prosecution in the earlier case, and then claiming there were no injuries characteristic of shaken-baby syndrome when testifying in defense of Woodward, Baden had demonstrated that his opinions lacked substance and changed with the weather. Having thus damaged Baden's credibility, the prosecutor then pressured him on every element of his testimony, gaining Baden's admission that he'd not reached his "expert" opinions independently, but had followed the interpretive lead of other doctors involved in the case. In the end, according to Timmermans, the prosecutor "not only managed to show that Dr. Baden might be expressing opinions about evidence he did not completely grasp but also allowed him to contradict himself and others" and had "so reduced his credibility that any difference of opinion he might have with a colleague would reflect not superior knowledge but idiosyncrasy."

Dr. Baden has embarrassed his profession in other ways as well. At times, Dr. Baden has collected exorbitant fees from defendants of widely-presumed guilt, and offered extremely speculative testimony in return. This has helped create the impression that his testimony--and the testimony of other celebrity pathologists, as well--was for sale, and could be obtained by the highest bidder. In the most notorious example, Dr. Baden collected approximately \$165,000 for his assistance to O.J. Simpson during his trial. This culminated in his telling jurors that in his expert opinion either more than one knife was used to kill Ron Goldman and Nicole Brown, or that a specially constructed double-edged knife had been used. He also claimed it would have taken Ron Goldman 15 minutes to die, which stretched out the time of the killings, and cast doubt on Simpson's guilt. He then suggested that Nicole Brown Simpson had had a late snack, and that this was why the amount of food in her stomach at autopsy suggested she'd been killed closer to the prosecution's estimated time of death of 10:15-10:30 than the defense's proposed time for her death, 11:00, when Mr. Simpson had an alibi. At one point in his testimony, things grew so heated between prosecutor Brian Kelberg and Baden that Kelberg demanded to know if Baden's opinions could be backed up by any scientific studies, and Baden replied that people can't be studied "like worms" and that "We can't do control studies of feeding somebody and killing them."

Baden also received a reported \$110,000 from Phil Spector during his first trial (in which Baden's wife functioned as Spector's attorney). In a dramatic and controversial twist to the case, Baden told jurors that the blood spatter on Spector's jacket didn't necessarily mean he was near his purported victim at the moment she was shot, but perhaps only reflected that she'd coughed blood on him after she'd shot

herself, with her last breath. He even got his old HSCA colleague, Dr. Werner Spitz, to back him up on this.

The precise exchange between prosecutor Alan Jackson and Spitz on 7-26-07 (found in an online blog, which I'm assuming is reasonably accurate) is most informative, as it reveals not only the depths to which Baden and Spitz would go for a paying client, but the contempt they hold for those with expertise they do not share, and whose opinions are in opposition to their own.

Jackson: "So, and you are not an expert in blood spatter, but in your opinion, even if there was no blood found *anywhere* beyond the hem of Lana Clarkson's skirt -there was no blood on her thighs, no blood on her calves, no blood on her feet or her shoes or the carpet underneath her – even so, the jacket can still be six feet away and have blood on the left side of it?"

Spitz: "Yes, that's what I am saying, because the velocity of the blood – you wouldn't expect to have it close by the source – you would expect it to be farther away."

Jackson: "So, the spray came out of Lana Clarkson's mouth, and Phillip Spector was just *so* unlucky that here he was, 6 feet away from her, and all of this spray ended up on his jacket – but nowhere else – not behind him or in front of him or below him or above him – Just on Him??"

Spitz: "Well, when you say all of it – you make it sound like you have a bucket full – he has all of 18 spots on him, which includes some spots that have been described as transfers."

Jackson: "So in your opinion, doctor, and you agree that all of the experts – even the defense experts – they all say that Lana has spatter on her dress – and what you are telling this jury is that when the gun went off, spatter came out her mouth, and some landed on her dress, but the rest of this spatter – it jumped and skipped her thighs and her knees and her calves and her shoes and jumped and missed the carpet and all of this spatter landed on Phillip Spector's jacket?"

Spitz: "You are probably correct in that description – but it didn't have to jump, the amount of spray she had was quite small – it came out of her mouth and a little dripped down some spray onto the hem of her dress..."

Jackson: "So it changed trajectory? It went down on her dress and then completely made a 180 degree turn and flew across the room 6 feet to get onto the jacket?"

Spitz: "Well, now you are making it sound like those people who criticized the so called magic bullet theory in the Kennedy assassination ..."

(So here we have Spitz trying to hide behind his purported expertise, and insinuate that those questioning his and Baden's new nonsense are as out to lunch as those questioning their old nonsense. The irony of his response seems lost on him. He seems totally unaware that the majority of Americans--and thus the majority of jurors on the panel--who've looked into the Kennedy assassination for more than a moment have come to dismiss the "magic bullet" theory he finds so compelling. And this was no momentary brain fart, mind you. While testifying for the prosecution in a hearing regarding convicted murderer Larry Swearingen in March 2012, and recounting his vast experience, Spitz defended his findings on the JFK case by claiming that "By far, the majority of Americans today believe" that Kennedy was not shot at from two directions, but shot from behind by "Mr. Oswald." I mean, really, where does he get this stuff?)

Jackson: "You are aware, doctor, are you not, that Stuart James, a paid defense expert, a man highly regarded in his field, completely disagrees with you. He says, in fact, that the spatter pattern on the jacket, which is millimeter and sub millimeter in size, is consistent with a high velocity spatter. Are you aware of that?"

Spitz: "I did not discuss that with him".

Jackson: "Doctor, I don't care what you discussed with other witnesses outside of this courtroom – are you aware that this was his testimony before the jury?"

Spitz: "No, I am not aware of that."

Jackson: "Would you defer to those experts in other areas and sciences that have more expertise than you?"

Spitz: "At this point, I don't know what I'm deferring and not deferring – all I know is that if I saw something for myself, I would not defer, and I know that this can happen."

Jackson: "Really? How many times have you seen blood spatter come out and then skip all these targets and find another target and then change trajectory and find another target?"

Spitz: "Not spray that deliberately as you put it changes trajectory – you are assigning volition to something that has no volition..."

Jackson: "Doctor, isn't it a more reasonable inference just that simply put Phillip Spector's jacket was closer in proximity to the blood letting event?"

Spitz: "No – because he would have more than 18 little spots on him – you would have a different density – you would have a large amount of tissue..."

Jackson: "Doctor, didn't you say yesterday that there was very little blood spatter in this case?"

Spitz: "I don't remember saying that."

Jackson: "Well, wouldn't you agree that the blood spatter in this case would be limited?"

Spitz: *"It would be limited to that which would occur from a wound by a .38 caliber missile into an area that is highly vasculated and under arterial pressure – and this is like a garden hose, these arteries, and when these arteries are cut, the blood can be like a garden hose under pressure and the blood can easily reach a ceiling 12 feet high."*

Jackson: "Well Doctor, she didn't cut an artery, so that is irrelevant."

Spitz: "It is not irrelevant at all – no, she didn't cut the jugular or the carotid, but every artery is under the same pressure."

Jackson: "So where is all the blood on the ceiling? Where is the blood on the carpet?"

Spitz: "Her head wasn't pointing at the ceiling."

Yes, you read that right. Spitz contradicted himself. In the beginning of his testimony he'd pushed that a fine spray of blood could have been coughed up by the victim, or splashed back from the victim, only to land on Spector's jacket six feet away. Under intense questioning, however, he'd changed course and suddenly started claiming that a bullet passing a bunch of arteries--even if it missed the jugular and carotid arteries--would create a wound in which blood spewed out like a garden hose. Well, have you ever seen water squirt from a garden hose with such velocity and precision that none of it lands between the nozzle and the plant being watered, six feet away? It bears noting, moreover, that Spitz readily accepted that a high-velocity bullet passed through Kennedy's neck, within millimeters of his arteries, and that blood did not spew from Kennedy's neck like a garden hose.

Exchanges like the one above, in which it is readily obvious Spitz was presenting a defense for his client (a man he admitted was paying him 5,000 dollars a day), whether the evidence supported him or not, makes me wonder if the term "pathological liar" is a reference to someone who can't help but lie, for pathological reasons, or a reference to someone who lies so readily they could have a successful

career as a pathologist. I'm serious.

When one studies the Spector case, in fact, it's hard to come to any conclusion other than that Baden and Spitz knowingly lied for money. At another point in the case, a former member of the defense team testified that Dr. Baden had been handed a piece of the victim's tooth at the crime scene, and that he'd failed to present this evidence to the authorities. Dr. Baden, of course, vehemently denied these charges. Even if one assumes Dr. Baden was telling the truth on this matter, however, and assumes further that Drs. Baden and Spitz both sincerely believed their testimony, it's impossible to believe they would have testified as they did if they'd been hired by the prosecution. One can only wonder then what Dr. Baden and the HSCA Forensic Pathology Panel could have come up with had they been told that Lee Harvey Oswald was their sole client, and that they were to receive six-figure bonuses for providing him a solid defense.

One final note on Baden and his questionable expertise... After I brought Baden's testifying with the autopsy photo upside down to the attention of Marquette University Professor John McAdams on November 22, 2006, McAdams, an HSCA defender, had an interesting response. He said "Baden clearly knows how the photo is oriented, since he correctly says that the top of the photo is the front of Kennedy's head." This was like saying that a captain commanding a ship from Cannes to Cairo who washed ashore in Capetown clearly knew what he was doing since he came to port in Africa.

And from there it only got weirder. By 2010, McAdams, apparently incapable of admitting any error by anyone whose "expertise" he needs to rely upon to shore up his single-assassin conclusion, started claiming the belief Baden testified with his exhibit upside down was a false one. On 10-1-10, on his alt.assassination.JFK newsgroup, he claimed:

*No, he put the photo up with the forehead upward, and then used his pointer to *correctly* point to the forehead.*

This is just a silly factoid.

The orientation that Baden used is the one that Stringer would have seen through his viewfinder.

John

Well, this is just nonsense. Anyone who'd actually watched a video of Baden's testimony would know that Baden pointed to an area ABOVE the purported exit on the photo, and said it corresponded to an area ABOVE the purported exit on the drawing of Kennedy. This PROVES he thought he put the photo right-side up on the easel.

McAdams' refusal to acknowledge this, and his invention of the ridiculous "factoid" that Baden was trying to show the committee the photographer's viewpoint, furthermore, reveals both the irrational nature of many JFK "researchers"...

and that the "cult of expertise" lives on.

V-Shaped Notch Comparison

Current interpretation of the open cranium photo by the HSCA ballistic expert Larry Sturdivan, which seems to match the impressions of Dr.s Kerley and Snow as related in their HSCA report. (From the website of Paul Seaton.)

Groden Autopsy Photo

V-Shaped Notch Comparison.

That the official way to look at the “mystery photo” is sideways is confirmed yet again by the HSCA Report of Dr.s Ellis L. Kerley and Clyde C. Snow, anthropology consultants tasked with determining the authenticity and consistency of the autopsy photos and x-rays. Their report states “The photographs of group 5 (Note: group 5 is described as “Anterior-superior”--from the front and from above), which show the cranial cavity with the brain removed, are somewhat more difficult to evaluate. One feature of interest is the outline of the fractured margin of the frontal bone that is partially visible in the *foreground* of these photographs. A deep V-shaped irregularity in this margin is also visible in photographs of group 1 in which the scalp is partially reflected to expose the underlying bone.” (Note: they can't even get the group numbers right. Group 1 is the left lateral view, which shows no defect. They clearly mean group 2, the right lateral view)

Amazingly, the doctors' impression, while in basic agreement with Dr. Angel's impression, is at odds with the impressions of the pathology panel itself, whose findings their report was supposedly supporting. The pathology panel, after all, held that the bullet exiting Kennedy's frontal bone had exited along the coronal suture, at a point roughly halfway between his ear and the top of his head. The "v-shaped irregularity" on the right lateral photos, on the other hand, was on Kennedy's forehead, barely an inch above his eye. Additionally, while the v-shaped scalp tear on the lateral view would appear to have come as a result of the “wing” section of bone near the President's temple exploding downwards across his face, as demonstrated in Zapruder frame 337, the forensic anthropology report implies it was caused by an underlying fracture. This is a bit strange since the report acknowledges the scalp in the lateral view is partially reflected to expose the underlying bone, bone which reveals no such fracture.

The HSCA's ballistics expert Larry Sturdivan has shared his current interpretation of the wounds in his

book, *The JFK Myths*, and on the website of Paul Seaton. Surprisingly, he not only now feels the entrance was near the EOP a la the autopsy doctors, but that the purported beveled exit was on the forehead a la Angel, Kerley and Snow. This makes him unique. The autopsy doctors, whose impression of the entrance wound is now shared by Sturdivan, were most adamant that there was no missile exit in the frontal bone. This is demonstrated by the following exchange between Dr. Humes and Dr. Angel before the HSCA pathology panel.

Dr. Humes: *"This is not frontal bone where that semi-circle is—it's either temporal or parietal bone, Dr. Angel.*

Dr. Angel: *"I don't see how it can be. That's what it looks like to me."*

Dr. Humes: *"That's exactly what it is."*

Besides the problem that not one witness noticed an exit wound in Kennedy's forehead, the problem with Sturdivan's impression of the photo is that it presents the large defect cutting diagonally across the frontal bone. This is in disagreement with both the autopsy photos and x-rays. While Sturdivan gets around the first problem by questioning whether the piece of beveled bone in the photo really represents an exit, he is yet to explain the second.

What's truly disturbing, however, is that the HSCA's own wound ballistics expert now repudiates their location for both the entrance of the fatal bullet on the back of Kennedy's head, and its exit toward the front of his head, and that no one in the national media has noticed his change of opinion or thought it worthy of bringing to the public's attention.

Chapter 14: Demystifying the Mystery Photo

An intense examination of an autopsy photo so confusing that doctors won't guess what it shows

Scalp Triangle Comparison

Could this be
the same section
of torn scalp?

Fox autopsy photo

Groden autopsy photo

Crop of Fox autopsy photo,
inverted for comparison purposes.

Crop of Groden autopsy photo

For reasons beyond my grasp, the first image in each chapter sometimes fails to appear. If there's nothing up above, don't despair; you can still see the image [here](#)

Scalp Triangle Comparison

By analyzing the scalp in the background of the open-cranium photo one finds another way to determine its proper orientation. This is because if one were to interpret the photo as being taken from the front, a la the HSCA, it would mean the doctors left the scalp intact at the back of the skull near their supposed entrance, the area they were supposedly inspecting and photographing. This just makes no sense.

When one looks even closer at this un-reflected scalp, one can see a triangle-shaped section of torn scalp. As there were no scalp lacerations at the back of the head recorded in the autopsy protocol and the testimony of the doctors asserts there were no incisions made on the scalp beyond one by the left ear, these obvious lacerations shouldn't exist (unless one is to allow that the doctors ripped Kennedy's scalp apart with their bare hands!!), should one insist this photo was taken from the front. Since a similar scalp triangle is apparent near the President's right forehead in the lateral autopsy photo, it is simply far more logical and less gruesome to assume this photo was taken from behind.

When one notices Kennedy's haircut in the autopsy photos, and realizes that the hair was much longer on top, and remembers that the doctors did not shave or cut Kennedy's hair, the question arises then of where this hair went to, should one still believe the open cranium photo was taken from the front. Why is the hair in the scalp triangle so short, if it is in fact from the crown of Kennedy's head, as would appear to be the case, should one still interpret this photo in the official manner? Since the hair by the

temple was much shorter than the hair at the top of Kennedy's head (as made clear by the left profile photo) doesn't it simply make more sense to conclude the hair in the scalp triangle came from Kennedy's temple? To my eyes, the scalp triangle only makes sense if the mystery photograph was taken from the rear.

Entry Wound Close up and Neck Line Comparison

When one inspects the back of the head photo and matches its neck lines with those on what is presumed to be the neck in the open cranium photo, one finds yet another argument that the open cranium photo depicts the back of Kennedy's head. Certainly the lines on the open cranium photo are not just random lines on a towel. Since the HSCA Authenticity Report stated "Such lines develop in most individuals by middle age, but their exact arrangement forms a pattern that is virtually unique to the individual" one would like to think they tested the lines to see if they matched. Unfortunately, there is no mention of this in their report.

Perhaps they'd failed to do this because they'd concluded the lines weren't in fact lines of the neck... While I'd once thought the lines conclusive, and mentioned them in my videos, I now have my doubts. In 2010, I received an email from a reader named Martin, and he pointed out to me that when one looks at high-contrast versions of the mystery photo what I've purported to be Kennedy's neck appears to be a flat block or tray of some sort, on which the skull is resting on its side. (I hope to perform some re-enactments which will make this more clear.) In any event, when one views these high-contrast images, what I've previously presumed to be neck lines appear to be artifacts--scratches on the photos or some

such thing. Now I really can't say for sure. But neither can I honestly claim the mysterious lines on the mystery photo are neck lines, and that this proves the photo was taken from behind.

But that's okay. There are numerous other indications that the open cranium photo depicts the entrance wound described at autopsy, and that it was thus taken from behind. Let us remember here that on their January 26, 1967 report on the photos, the doctors asserted, when discussing the color photo of the back of the head, that "due to the fractures of the underlying bone and the elevation of the scalp by manual lifting (done to permit the wound to be photographed) the photographs show the wound to be slightly higher than its actually measured site." This indicates that before they pulled the scalp up, the entrance in the scalp was slightly lower and hidden in a skin fold. This explains the slightly lower position of the wound in the open cranium photograph. Not only that, this indicates that the position of the entrance wound before it was "lifted" approximated the teardrop of spinal fluid readily visible in the scalp on the back of the head photographs and repeatedly identified by the original autopsists as the entrance location. From this it seems logical that this mysterious fluid is no mystery at all, but is instead some macerated brain matter that leaked from the entrance wound during the long flight from Dallas.

A close inspection of the wounds is especially revealing. While it is usually inferred from the Warren Report's description of the "slicing" associated with the occipital entrance wound that the wound was vertical, and the Rydberg drawings portray it as such, Dr. Finck, the bullet wounds expert at the autopsy, informed his Army superiors in a report filed in January, 1965, that the wound was "transversal," heading right to left. (While Humes' misrepresentation of the wound may have been an honest mistake, it's intriguing that, within a week of interviewing Humes, Arlen Specter asked Parkland witness Dr. Clark if his observations were consistent with the presence of a "*lateral* wound measuring 15 by 6 cm. on the posterior scalp." Did Specter know Humes' testimony was incorrect? If so, how?) Anyhow, Finck's description of the wound as transversal makes perfect sense when one remembers Boswell's inclusion on the autopsy face sheet of an arrow heading both to the left and upwards from the bullet entrance, particularly when one considers that Boswell would have immediately connected in his mind the large exit high on the skull as the logical exit of the bullet making the small entrance below, and heading to the left.

One can deduce from this then that the bullet came from the President's right, or that it hit the President while his head was turned to its right, just enough so that the bullet grazed along the flesh on the outside of his skull before entering. The so-called military review of January 26, 1967, says as much, stating, when discussing the photo with the President's scalp still intact "The scalp wound shown in the photographs appears to be a laceration and tunnel, with the actual penetration of the skin (NOTE: they must have meant "skull") obscured by the top of the tunnel. From the photographs this is not recognizable as a penetrating wound because of the slanting direction of entry." Dr. Finck's description of the wound and assertion of a tunnel is, not coincidentally, completely at odds with the Clark Panel and HSCA purported in-shoot in the cowlick. The skull at the Clark Panel's location for the bullet hole had been removed, in fact, before Dr. Finck had even arrived at the autopsy.

Should one accept that the entrance described at the autopsy could be the transversal entrance proposed in the images above, but have a problem believing that this bullet entrance could 1) have gone unnoticed by the Parkland doctors, and 2) be so hard to spot in the scalp on the back of the head photos, one should read more wound ballistics literature, as it is filled with stories where the entrance wound proved equally elusive. In *Crime Lab: Science Turns Detective*, for example, a story first told by Dr. Le Moyne Snyder is re-told by author David Loth. Loth tells of a young man who'd been treated for a .22 caliber rifle wound in the shoulder but whose condition continued to worsen. Finally, the doctor decides to inspect the rest of the man's body. The story concludes: "Behind the right ear, hidden by hair, was a tiny round hole, with the faintest trace of blood. The damage of the second bullet had been

internal, and extensive. The victim died a few minutes after this wound was located" (That a wound caused by a .22 rifle would be less severe than a wound caused by Oswald's rifle has not been overlooked, and should make one wonder if maybe, just maybe, the small initially-overlooked entrance wound on the back of Kennedy's head was caused by a rifle other than Oswald's. Much, much, more on this to come.)

While one might also wonder why there's so little hair visible near the hairline in the open cranium photo, this, too, has an explanation. Dr. Finck told the HSCA: "I don't remember the difficulty involved in separating the scalp from the skull but this was done in order to have a clear view of the outside...the scalp is adherent to the skull and it had to be separated from it in order to show in the back of the head the wound in the bone." Finck, we should remember, never budged from his contention that this entry was on the occipital bone of the skull, inches away from the HSCA's entry in the cowlick. Is it just a coincidence, then, that this is precisely what's depicted in the open cranium photo once one accepts it was taken from behind?

Foramen Comparison

Sometimes the most convincing information is the hardest to look at. When one looks at the open cranium (or mystery) photo and focuses one's attention not on the white skull, but on what lies beyond the white skull, one can easily discern that it is not brain matter or the roof of a skull, as one would expect if this photo was taken from the front, but is absolutely positively the floor of a skull.

Some of the holes in the base of the skull, or foramen, can even be identified in the mystery photo. While the collapsed scalp from the forehead obscures much of the anterior and middle fossa, (the base of the skull above the eye sockets and by the ears), a small section of the posterior cranial fossa, (the base of the skull at the back where the spinal cord enters the skull) is fairly in focus. There are what appear to be two stubs of veiny material, around the rims of two holes in this area. These correspond precisely with the two foramina one should expect to find in this area. This seems way too much a coincidence. When one compares the relative positions of the Internal Auditory Meatus (#9), which gives passage to facial and cranial nerves, the Jugular Foramen (#10), which provides a passage for the internal jugular vein, and the rounded bowl-shape to the posterior cranial fossa apparent on any anatomy website, one should have no problem identifying the location of these same structures on the open cranium photo, and determine that this photo is indeed taken from behind.

Deeper Focus

When one looks even deeper in the photo, one finds other features suggesting the photo was taken from behind. In the base of the skull furthest from the camera, one can see what appears to be a pillar of bone, with a horn sticking out to the right. This is almost certainly the dorsum sellae with its horn--the right clinoid process. At its base, moreover, there's a fissure, running down to the jugular foramen. This fissure is almost certainly the petro-occipital fissure. There are no similar features on the back of the skull, not in the parietal region, the location of these features according to the HSCA, nor in the occipital region, where some theorists place these features.

Ridge to Nowhere

Blue arrows in the photo at right point out the transverse sinus near the base of the back of the skull.

Above: HSCA ballistics expert Larry Sturdivan's current orientation of the mystery photo. Note that he places the bullet hole in the middle of a lateral sinus. As there is no such sinus in the skull near the cowlick entrance (as shown in the photo of the upper calvarium at left), he proposes that the bullet hole was in the transverse sinus near the EOP, in the location originally described at autopsy.

Color photos courtesy Forensic Neuropathology, 2007

As the transverse sinus along the base of the skull is just a faint ridge and bares little resemblance to Sturdivan's "lateral sinus," however, it's clear he was just seeing what he would like us to see.

Ridge to Nowhere

Still, there are those who disagree with even this simple analysis. The HSCA's ballistics expert Larry Sturdivan, in his determined but frequently inaccurate defense of the lone-nut conclusion, *The JFK Myths*, not only prints the mystery photo sideways, but claims that what appears to be the Jugular Foramen is instead the bullet hole near the EOP described by the doctors, only seen from the far side of the skull. In fact, he cites this bullet hole as his reason for believing the autopsy doctors were right about the entrance near the EOP: "*The President's parietal bone was extensively fractured all the way back to the occipital. The autopsy team said they removed loose pieces of broken bone instead of cutting out the usual "skullcap" to remove the brain. But if they removed enough of the parietal to remove the brain, the pieces containing the "higher" entry wound would have to have been among the pieces removed. If the entry wound had been lying on the autopsy table, how could it have been clearly shown in the photograph of the interior of the skull...?*" Equally intriguing, Sturdivan asserts that the vein-like material around this "entrance" is a "stretched "hood" of dura."

While searching for a good definition of dura, I discovered that the material around the holes could only be dura if the holes are foramen, as I believe. According to Gray's Anatomy, "The Dura Mater is a thick and dense inelastic fibrous membrane which lines the interior of the skull....In the posterior fossa it sends a process into the internal auditory meatus, ensheathing the facial and auditory nerves; another through the jugular foramen, forming a sheath for the structures which pass through this opening..." Since I have never read of dura being stretched into a tube by a bullet's entrance, and since the Gray's description makes it clear that dura is inelastic, I am skeptical that the tube-like material in Sturdivan's interpretation of the photo could be dura. Comments by anatomists, doctors, and morticians welcome.

Sturdivan's interpretation of the photo does not exactly support the autopsists, moreover, in that it entails a beveled exit on the forehead that apparently escaped their attention. (He notes that they reported no such exit, states that "It seems unlikely that they would overlook such an obvious feature", but fails to say what he believes the beveling represents.) His interpretation also fails to explain the second hole beside his purported entrance. While he does acknowledge the fissure presumed to

represent the petro-occipital fissure in the photo, he strangely claims that it, along with the far edge of what appears to be a pool of blood, represents the "lateral sinus," an apparent reference to the transverse sinus, a raised ridge of bone along the base of the posterior cranial fossa. He fails to explain why this "ridge" comes to a sudden stop as it approaches the supposed entrance hole. He certainly can't believe the internal beveling on the skull caused by the bullet was far more extensive along the sinus than on the skull in actual contact with the bullet...

Or maybe he can... But he's wrong. Only adding to Sturdivan's "sinus problem" is the contention in his book, *The JFK Myths*, that the bony outcropping interpreted to be the right clinoid process on the previous slide is the "petrous process," an apparent reference to the petrous bone separating the base of the skull at the back of the head (or posterior cranial fossa), and the base of skull by the ear (the middle cranial fossa). If so, well, then he needs to explain why, in his interpretation of the mystery photo, there is a gap between this bone and the right side of the skull.

Reflections on Reflection

Since those defending the official view of this photo complain that conspiracy theorists print it the wrong way, and that "standard operating procedure" dictates that scalp is reflected *over* the face during an autopsy, I decided to confront this argument head-on by finding a photo of a typical reflection of the scalp. And guess what, they are right. Typically the scalp is reflected over the face. But what these defenders, including conspiracy theorist Don Thomas, forget to say or pretend not to notice is that just as typically 1) the skull cap is cut in an even line across the forehead, and 2) the posterior part of the scalp is reflected down towards the neck. In their interpretation of this photo, of course, there was 1) no cut across the forehead, just a jagged edge, and 2) no reflection of scalp at the back of the head, just tangles of torn scalp.

S.O.P. was not employed... Thus, Thomas and others sharing this argument are sadly S.O.L.

In an article found online, Dr. Ed Uthman describes a typical reflection of the scalp as follows: "The diener (an assistant) uses a scalpel to cut from behind one ear, over the crown of the head, to behind the other ear... The skin and soft tissues are now divided into a front flap and a rear flap. The front flap is pulled (this takes some strength) forward (like being scalped) over the patient's face, thus exposing the top and front of the skull. The back flap is pulled backwards over the nape of the neck." This approach, moreover, is confirmed by Handbook of Autopsy Practice (2009), which claims "The anterior and posterior halves of the scalp are reflected forward and backward, respectively..." Autopsy Pathology (2004), a medical textbook found at the New York Public Library, further confirms: "Incise the scalp down to the bone, and then peel the skin and subcutaneous tissues back to below the occipital protuberance posteriorly and to the level of the forehead anteriorly by a combination of sharp and blunt dissection." In The Hospital Autopsy (2003) the reflection of scalp over the neck is confirmed yet again: "incise the scalp, starting behind one ear and finishing behind the other. Reflect the scalp forwards and backwards using blunt dissection, examining the underside of the flaps for haemorrhage or damage." And, finally, Understanding the Autopsy (1992) confirms this as well, stating, simply: "The scalp is peeled off the bone, forward and back." The pattern then seems clear: when scalp is reflected forward it is also reflected backward.

That this is the typical pattern is confirmed, moreover, by the Armed Forces Institute of Pathology autopsy manual, which David Lifton obtained and discussed in his best seller, Best Evidence. The Armed Forces Institute of Pathology was, tellingly, not only Dr. Finck's employer, but the provider of the only course on Forensic Pathology ever taken by Dr. Humes.

This demonstrates beyond any doubt that the reflection of scalp depicted in the mystery photo was not the "typical" reflection of scalp claimed by others.

As the entrance at the back of the head was one of the areas the doctors were trying to inspect, and as the scalp at the back of the head was reportedly intact, and as none of the four scalp lacerations noted in the autopsy report came anywhere near the exit near the EOP, and as it MAKES NO SENSE for them to have just ripped apart the scalp at the back of Kennedy's skull with their bare hands, to be clear, it seems likely that the reflected scalp in the mystery photograph is the scalp at the back of the head, atypically, due to the extensive damage to the right side of the skull, reflected to the left. This interpretation is confirmed, furthermore, by the statements of James Jenkins and Paul O'Connor, Dr. Humes' and Dr. Boswell's assistants during the autopsy, to Harrison Livingstone, as recalled in Livingstone's 1992 book High Treason 2.

As the assistants normally tasked with removing the brain, moreover, the recollections of Jenkins and O'Connor regarding the removal of the brain can not be readily dismissed. In 1993, in an interview with William Law, in fact, Jenkins made it all as clear as can be. He said *"We normally did a skullcap. We didn't really have to do a skullcap on this because, as they expanded the wound, it was large enough for the brain to come out."*

The recollections of Jenkins and O'Connor are supported, furthermore, by those of the radiology tech at the autopsy, Jerrol Custer. According to Livingstone, Custer at first claimed that during the autopsy Kennedy's face had appeared to be *"deformed...squished...It seemed like someone had taken a clay image of his face and pushed it together...the scalp and the front part of the face seemed like everything had drooped forward,"* and that Custer later made it clear this was only *"after the scalp had been reflected in the back and the brain removed,"* as *"The face no longer had anything to hold it tight over the skull."* If the scalp had been reflected as in a typical reflection, of course, it would have been reflected right over the face, and Custer would not have been able to make these observations.

So what about Humes and Boswell? Well, Boswell was also interviewed by Livingstone, and his

statements also suggest Kennedy's scalp was reflected to the left, and that the mystery photo was taken from behind. In a 9-1-91 interview, quoted in High Treason 2, Boswell described the large head wound as follows: *"the scalp was lacerated, and a pretty good size piece of the frontal and right occipital portion of the skull had separated and were stuck to the undersurface of the scalp. So when that was reflected, then it was true; there was a big bony defect in the right side of the skull. And with the fragments--I think the brain was largely removed through that defect."* If they could remove the brain through that defect, it follows, there would be no need for them to remove the entire top of Kennedy's skull--the procedure purportedly depicted in the mystery photo, when interpreted to have been taken from in front of Kennedy.

Then, what about Humes? Well, Dr. Humes himself made a number of statements regarding the reflection of the scalp that only make sense when one views the photo as taken from behind. He told the Warren Commission.: *"I extended the lacerations of the scalp...down in the directions of both of the President's ears... We had to do virtually no work with a saw to remove these portions of the skull, they came apart in our hands very easily...as we moved the scalp about, fragments of various size would fall to the table...when we reflected the scalp away from the badly damaged skull, and removed some of these loosened portions of skull bone, we were able to see this large defect in the right cerebral hemisphere."* One can only assume that when he says he reflected the scalp away from the badly damaged skull, he doesn't mean he reflected the scalp over the badly damaged skull near the President's right temple, as would be the case should he have reflected the scalp in a manner consistent with the official interpretation of the autopsy photo.

Dr. Humes' discussion with the HSCA forensics panel thirteen years later is even more helpful. When asked about the supposed in-shoot in the cowlick, he replied: *"I don't know what that is. Number one, I can assure you that as we reflected the scalp to get to this point, there was no defect corresponding to this in the skull at any point. I don't know what that is. It could be to me clotted blood...it certainly was not any wound of entrance."* Notice that he says they had *"reflected the scalp to get to this point,"* implying that *"this point,"* the red spot in the cowlick adjacent to the midline, was some distance from where they had begun reflecting the scalp. Note also that when one views this photo under the assumption the bone in the foreground shows forehead the scalp near the supposed entrance in the cowlick has not been reflected at all!

Humes' comments to the Journal of the American Medical Association in 1992 are also relevant. He said *"The head was so devastated by the exploding bullet...that we did not even have to use a saw to remove the skullcap... We peeled the scalp back and the calvarium crumpled in my hands from the fracture lines..."* Since there was little damage to Kennedy's left skull, and since Humes said there was little or no cutting, Humes' comment that they did not need to remove the skullcap confirms that they did not cut the skull on the left side of Kennedy's head, and that they therefore, by necessity, must have pulled the brain out from the devastated right side of Kennedy's skull. Since there was talk of an open-casket funeral, it only makes sense that the doctors would try to preserve as much of Kennedy's face as possible. If this was so, then they would have logically reflected the scalp back and to the left, pulled the brain out from the right side of his skull, and preserved the left side of his face.

Humes' words to the ARRB in 1996 further support this analysis. He told Jeremy Gunn: *"Once we got the scalp laid back, some of those pieces could just be removed, you know, by picking them up, picking them up because they were just not held together very well, other than by the dura, I suppose. So other than that, we probably made it like we normally do, in a circumferential fashion from books, like right above the ear around. But it was a real problem because it was all falling apart, the skull. And I can't recall the details of exactly how we managed to maneuver that, because it was a problem."*

Notice that Humes always discussed reflecting the scalp away from the badly damaged skull, toward the back of the head, or flat-out backwards, and that he never once discussed reflecting the scalp over

Kennedy's forehead. This proves Don Thomas' claim in his book *Hear No Evil* that "*when I performed craniotomies at the Pathology Department of the Memorial Medical Center in Long Beach, California, I always reflected the anterior scalp forward to the eyebrow before removing the skull cap...the chief prosector, Dr. Humes, stated that he followed this procedure...*" not only untrue, but doubly untrue. Not only did Humes not claim he'd followed this procedure, he specified that he didn't have to perform a procedure of any kind in order to remove the brain. (Sorry, Don.)

This suggests something else as well. The scalp was reflected back and to the left.

After reading an online article by Dr. Chad Zimmerman, in which he correctly pointed out that to reflect the scalp to the left the doctors would have needed to cut along the base of the skull at the back of the head, and that Dr. Humes told Gunn and the ARRB that he didn't make any incisions beyond the one between Kennedy's ears, however, I realized that things were not as clear as I'd like them to be. After re-reading Humes' and Boswell's discussion with the pathology panel, from 19 years earlier, however, it became clear there was some minor cutting along the back of the head. Boswell: "*we just folded that back and this back and an anterior flap forward and that exposed almost the entire—I guess we did have to dissect a little bit to get to...*" Humes: "*To get to this entrance, right?*" Boswell: "*But not much...*"

Since the scalp by the entrance near the EOP (the only entrance the doctors could have been discussing) is indisputably intact in the official interpretation of the open cranium photographs, moreover, Humes and Boswell's statements to the HSCA support that the scalp was reflected to the left, and that the mystery photos were taken from behind. Everything fits.

In Dr. Zimmerman's interpretation of the "mystery" photo, on the other hand, the President's right ear is at the end of a line of reflected scalp. But if this is so then the gaping hole directly in front of the ear (where the wing of bone is flipped outwards in the other photos) is hidden by this line of reflected scalp. This raises the question of just how one reflects badly lacerated scalp over an area where there is no bone.

And that's but one of the problems with Zimmerman's orientation for the photo. In an attempt to explain how he was able to understand the open cranium photographs to a greater degree than the autopsy doctors, Zimmerman said I "tend to believe that the color prints were not shown to the autopsy physicians during their interview with the HSCA investigators." This is self-serving and inaccurate, since the doctors were shown *all* the photos in 1966, and 1967, and again by the ARRB in the late 1990's, and failed to come to the conclusions espoused by Zimmerman. It's also misleading in that the record shows the HSCA Forensic Pathology Panel, not the HSCA "investigators" cited by Zimmerman, showed Dr.s Humes and Boswell open cranium photograph number 44. Number 44 is, of course, *a color print*.

The Color of Deception???

Groden autopsy photo

Two versions of the Fox autopsy "mystery" photo found on the internet.

Are the three photos above in fact the same photo?

At left, HSCA Figure 25, a blow-up from photo #44

The Color of Deception???

Dr. Zimmerman is not alone, however, in his obsession with the colors in the photo. In *The JFK Myths*, Larry Sturdivan similarly suggests that the key to understanding the mystery photo rests not only in its features, but in its colors. (The color versions of the photo are, of course, inaccessible to most researchers.) Sturdivan, for example, claims that the area appearing to be neck is really blue cloth. He also claims that *"The entry crater was filled with what seemed to be clotted blood with a dark hole through it. On the poorer view, #45, there was a blue highlight on the side of this hole. All other highlights were white. The shade of blue on this one highlight, however, was the same shade as the blue cloth lying behind the head. We took this as an indication that the hole through the clot extended all the way through the skull and the highlight was reflected light from the underlying cloth."* (The "we" refers to Sturdivan and the Dr. who accompanied him to the archives...Dr. Chad Zimmerman.)

This momentarily threw me for a loop. I couldn't remember anyone else noting that a blue cloth was visible through an entrance. While there were no color versions of this photograph available on the internet, the late researcher Tim Carroll was able to locate one in a brochure put out by Robert Groden, and post it where I could download it. The appearance of this color photo raises some interesting questions.

One: which photo is it? Well, since Figure 25 is purportedly a blow-up of photo #44, and since the beveled bone in Figure 25 does not precisely match the beveled bone in this photo, this must be the only other color photo of this beveling, photo #45. This means it's the same photo in which Sturdivan saw the blue cloth. When one looks at this photo, one sees a dark blue smear across the bottom of the photo, but this blue smear extends onto the skull in places and does not seem to correlate to any blue towel. The far right part of what appears to be neck is not blue at all, but flesh colored. If this is an accurate copy of photo #45, then Sturdivan is wrong. ***

Two: how do we know this is one of the color photos, and not a black and white photo colorized by Groden? We don't. We do know, however, that Groden had access to the color prints, through the

HSCA, and made himself copies. He told the ARRB “I went in and made copies for test prints. I kept some of them... They were made from the duplicates in the House Committee’s collection, not from the originals.” We also know he had this photo in his collection as far back as the mid-80’s, when he was writing his book, *High Treason*, with Harrison Livingstone.” Livingstone mentions this in his 1992 book *High Treason 2*. In the lawsuit Groden brought against Livingstone as a result of that book, Groden testified that the five color copies he obtained while working for the HSCA were “two photographs of the rear of the head, one photograph of the left side of the head, and one photograph of the right side of the head.” He has published only one other photo of the back of the head. Finally, we also have Groden’s stating, when discussing the autopsy photos he brought before the ARRB, that “There are photographs here I don’t believe were even used in the book” (a reference to his book *The Killing of the President*). Sure enough, this photo was not included in that book. Still, one has to wonder why this photo looks identical to the black and white photos when so many of those who’ve visited the archives report that the color photos have a much field of view than the black and white. Did Groden crop the photo to match the black and whites? If so, then why?

(In November 2009, I spoke to Groden and asked him about the blue and green colored smear across the top of the neck on the version of the photo in his pamphlet. He acknowledged that it was a flaw in the development process. He gave me a copy of his pamphlet. Upon subsequent inspection, I noticed that there was an asterisk next to the color version of the photo. The asterisk was explained elsewhere on the page, and indicated that the photo had indeed been colorized.)

Still, my decision not to accept Sturdivan’s interpretation had less to do with the Groden colorized photo than with Dr. Chad Zimmerman’s conflicting account of his trip with Sturdivan to the archives. In an essay on the trip on his (now-defunct) website, Zimmerman explained: “At first we did not notice the entrance in the posterior scalp. However, upon close examination between the two available color prints, I noticed a blue-grey spot on one of the prints...It wasn’t until I noticed this “spot” that I could see that the film of blood had broken and we could actually see through the hole. The blue-grey area was the reflection from the *underlying stainless steel examination table* behind the President’s head.” Yes, you got that right. In Sturdivan’s version the back of Kennedy’s head lay atop a blue cloth, but in Zimmerman’s it lay atop a stainless steel table. Confusing matters even more, the other single-assassin theorist to visit the archives in recent years, Dr. Robert Artwohl, assured an assassination conference audience in 1993 that what is here interpreted as Kennedy’s neck was not the blue cloth noted by Sturdivan, but a *yellow block*, and that the transverse lines on this block were not neck lines, but artifacts.

Needless to say, I’ll swear by Sturdivan’s blue towel, or Zimmerman’s stainless steel table, or Artwohl’s yellow block, when I see these photos myself.

Forehead Analysis

Fox autopsy photos.
(Left lateral image inverted)

When the rulers in the photos are made to match in size, and the mystery photo, left, is compared to the back wound photo, below, which makes more sense – that the bone in the mystery photo represents the back of the head, as at left, or the forehead, as at right?

If these three photos were all taken with the same camera and lens, and the mystery photo depicts a forehead, the head in the photo at left, should be nearly as large as the head at right.

Size of the forehead in the mystery photo at right appears to be larger than the forehead in the profile view, and yet the head in the profile view is still way too large.

Note: the curvature of bone at the front hairline fails to match

Forehead Analysis

Since autopsy photographer John Stringer told the ARRB he would “very seldom” change lenses during an autopsy shoot and would ordinarily use a standard or normal lens, it seemed logical to try and find out what lens was standard for the 4 by 5 Graphic view camera purportedly used to take the autopsy pictures, and if this lens was compatible with the open cranium photo as interpreted by the HSCA. Since a Department of Defense memo to the HSCA mentioned a 135 mm Zeiss Jena Tessar lens that was purchased along with the camera, I decided to see what the field of view was for this lens.

Sometimes one finds the information one needs in unexpected places. While rummaging through a Goodwill Store I found a 1961 book on press photography by the authors Rhode and McCall. This book, appropriately entitled Press Photography, reported that a 4 x 5 Speed Graphic camera, a hand-held variation of the Graphic view camera used by Stringer, would have a 51 degree field of view when equipped with its “normal” lens of 135 mm. Assuming this 51 degree field of view, then, and using the ruler in the back wound photo (which is apparently a 32 cm ruler) to measure an approximately 54 cm field of view at the distance of the ruler, I was able to estimate that the camera was about 56 cm from the ruler in the back wound photo. Since the open cranium photo, once the rulers were matched in size, was barely half as large as the back wound photo, this indicated that it was, in turn, taken from a distance of 28 cm, with a field of view at the depth of the ruler of about 27 cm. This was confirmed by

subsequent measurements.

Now it gets tricky. Since the ruler was about 28 cm or 11 inches from the camera in the open cranium photo, and since the ruler would appear to be 5 1/2 inches or less behind the bone in the skull closest to the camera, one is forced to conclude the camera was at least 5 1/2 inches from this bone. Assuming this bone is the forehead, this seems too far. (While messing around with a 35 mm camera I had to get within 3-4 inches of a skull before its forehead could fill the frame so completely.)

If one is to assume the ruler in the photo is 11 inches away, and that the closest part of the skull to the camera is 5 1/2 inches away, moreover, then one can calculate that the closest part of the skull is 100% larger in the photo in comparison to the ruler (based upon the roughly one to one ratio between the distance and the width of a 51 degree field of view). From this we can approximate the apparent size of the forehead. Since what is purported to be forehead is 5 times as tall as the ruler is wide in the photo, this means the forehead, once one takes into account that the forehead has been distorted in size by 100%, was roughly 3.64 inches tall. (5 x the approximately 37 mm width of the ruler, divided by 2, and then divided by 2.54, the number of cm per inch). This is bigger than the size of my forehead. While one might assume Kennedy's forehead was larger than normal and that this would seem to confirm the official interpretation of the photo, this confirmation, remember, is reliant upon the ruler being 5 1/2 inches behind the forehead within the skull, which at this angle means it's at the left ear. As there were no incisions reported on the largely undamaged left posterior quadrant of the skull, moreover, these measurements necessitate that the doctors tore this section of the skull apart with their hands for no apparent reason. This seems unlikely.

When Kennedy's forehead in the left lateral photo is sized to match the purported forehead in the open cranium photo, the problems with the official interpretation of the open cranium photo come clearly into focus. As the lateral photo depicts an over 12 inch field of view at the depth of Kennedy's face, we can assume the photo was taken from over a foot away. If one is to allow that the closest part of the skull to the camera in the open cranium photo is 5 1/2 inches away, this means the lateral photo was taken from about two and a half times further away, and should be approximately 2.5 times the size of the open cranium photo once the forehead is made to match. This means the lateral photo should be about 25% larger than the back wound photo (which is twice the size of the open cranium photograph) once all three photos are made to match. Instead, it's more than 50% larger!

Since an actual measurement of the lateral photograph reveals it to be about 2.8 times as large as the photograph of the open cranium once the foreheads are made to match, and since the lateral photograph appears to have been taken approximately 12 inches from the forehead, this indicates the camera must have been about 4.3 inches away from the skull when the open cranium photo was taken. This is in line with my earlier guesstimates. If this is true, however, since we've already ascertained that the ruler in the photo was approximately 11 inches from the camera, this would mean the ruler in the photo was 6.7 inches behind the part of the skull closest to the camera, which would place it at around 3/4 inch outside a normal-sized skull by the left ear, or at the far back of the skull.

It seems more than a coincidence then that there are no problems with the photo when one interprets it as being taken from behind. Since the ruler is in what would appear to be the posterior cranial fossa, it would be at most 3 1/2 inches beyond the bone closest to the camera. This would make the skull 7 1/2 inches away. If we calculate that the skull at the back of the head, from the neck up to the fracture near the crown is about 5.8 (the height of the skull at the back of the head in comparison to the width of the ruler) divided by 1.47 (the relative distance of the ruler to the closest part of the skull) times 1.46 (the presumed width of the ruler), we can deduce that this section of skull appears to be about 5.75 inches tall. When one looks at the back of a normal sized head at the downward angle suggested by the appearance of the posterior cranial fossa in the photo, moreover, one will find that the crown of the head, where the fracture appears to be on Kennedy's skull in the open cranium photograph, is roughly

at this level. We can suspect this is not a coincidence.

NOW, I am the first to admit the measurements in the preceding paragraphs are speculative and imprecise, but the basic point I'm aiming for is not. There's just no getting around it. When one compares the mystery photo to the other autopsy photos available to the public and considers that the photos are purported to have been taken with the same camera and the same lens, and to have not been cropped in any significant way, then it becomes fairly obvious, even to a layman, that the mystery photo depicts the back of Kennedy's head, and not his forehead.

The problem with the camera and its lens was the subject of a 29-page memo by the ARRB's Doug Horne in 1998. Horne was trying to locate the camera used at the autopsy, so that its negatives could be compared to the negatives of the autopsy photos, and help confirm their authenticity. But what he found was proof of deception. While the HSCA report on the photographic evidence insisted that "the Department of Defense was unable to locate the camera or lens used to take these photographs", Horne found memos from the Department of Defense asserting that they'd in fact found the camera, and a series of memos from the HSCA staff acknowledging the receipt of this camera. Even more unsettling, Horne uncovered a March 27, 1978 letter from HSCA Chief Counsel Robert Blakey to Secretary of Defense Harold Brown admitting "After examining the camera and comparing its features with characteristics on the autopsy photographs, our photographic experts have determined that this camera, *or at least the particular lens* and shutter attached to it, could not have been used to take the autopsy pictures. We have requested additional information in an attempt to locate another camera that might have been used and to determine if the lens could have been changed subsequent to November, 1963."

On April 20, 1978, John G. Kester, an assistant to Secretary of Defense Harold Brown, responded to Blakey's letter as follows: "It is presumed that the camera previously provided to the Committee was the camera used at the autopsy; the camera was described in a previous Committee request as a 4 X 5 Graphic View type, and the camera provided the Committee was the *only one* of that description in use in 1963. Although other lenses were also in use at the Medical Center during that time they have been replaced." While many, including Horne, suspect this indicates that one or more of the photos in the archives were not taken by photographer John Stringer on November 22, 1963, and are fakes, I suspect the real significance of Blakey's statement is that the 135 mm lens purchased at the same time as the camera and handed over by the Defense Department along with the camera could not have been used to take one or more of the photos. As the HSCA photographic experts left no notes detailing their failed comparison of the camera to the photos, one can only speculate which photo or photos failed to match. As the other photos are fairly uniform and consistent with what one would expect from a standard autopsy camera shooting standard autopsy photos, it seems likely that the photo whose "characteristics" were in disagreement with the 135 mm lens was the mystery photo when interpreted as depicting a forehead. No matter which photo or photos presented the problem, however, Horne's discovery demonstrates that the HSCA staff rejected and concealed the Department of Defense's identification of the camera rather than seriously question the authenticity and/or official interpretation of the photographs. In May, 1978, the HSCA was preparing to parrot the Warren Commission's conclusions. In light of this one shouldn't be surprised to find that Michael Baden, the head of the HSCA Forensic Pathology Panel, told Horne he was never even notified of the conflict between the camera and the photos. Equally unsurprising, no one could tell Horne the current whereabouts of the camera.

Focus on the Focal Length

In July 2006 my conjecture about the camera and the mystery photo received a response. Single-assassin theorist Jerry Logan expressed online that the erratic difference in ruler size between the various photos reflects only that the photographs were taken with different effective focal lengths. He stated further that in his opinion the mystery photo when interpreted as depicting a forehead *is compatible* with a Graphic View camera and a 135 mm lens, and that the mystery photograph as forehead appeared to have a 1:1 ratio (whereby the 4 x 5 negative captures the image of a 4 x 5 area). He explained that a 135 mm lens is 135 mm only when focused on infinity (with the lens as close to the film as possible), but that it would be 270 mm when focused on a close-up object with a 1:1 ratio. He suggested that the mystery photo was taken with the 270 mm focal length, as opposed to the other photos which were taken with the camera focused on infinity. He said “I’ve personally taken photos with a view camera and single lens that covered a greater range of magnifications than that shown in the autopsy photos.” He went on to theorize that the HSCA photo experts rejected the camera and lens turned over by the Department of Defense not for the reasons I suspected but “because of what they saw in the lens and didn’t see in the pictures.” He suggested that perhaps they discovered a flaw on the lens provided by the Navy, and that this flaw convinced them the lens was not used during the autopsy. In my opinion, he overlooked that the photo experts also considered the possibility the problem was with the camera. To me this suggests the problem had something to do with the proportions in one or more of the photographs and not with any feature specific to the lens.

While my understanding of photography and optics is admittedly rudimentary, I believe Logan missed other key points as well. As he admitted, when focusing on a close-up object such as the bone in the mystery photo, one would *increase* the focal length. In so doing, however, one would make the ruler in the background of the photo grow *larger in proportion to the forehead*, and appear too *BIG* when compared to the other photos, not too small. By way of example...if the bone is 8 inches away from the camera, and the ruler 14, an inch of bone would appear to be roughly 1.75 inches on the ruler. If the focal length was increased, however, so that skull 8 inches away filled the frame as if it were 4 inches away (when the camera was focused on infinity), the ruler would still be proportionate to the skull, and appear to be 7 inches away. In other words, the ruler would appear to be only 3 inches behind the bone and appear too *BIG* in the mystery photo in comparison to the other photos, not too small. This brings up the issue of whether the View Camera delivered by the Navy was capable of *shortening* the focal length of its lens. As acknowledged by Logan “The view camera has a bellows that allows the lens to focus much more closely than the 35mm. That’s why it’s possible to take macro photos (1:1) with an ordinary large format lens, while 35 mm cameras require special macro lenses or bellows.” There is nothing in the view camera to reverse this process, and allow it to take (short focal length) wide-angle shots with an ordinary large format lens, such as the 135mm Zeiss Jena Tessar handed over by the Navy. Autopsy photographer John Stringer’s statements to the ARRB, moreover, indicate that he didn’t use the bellows for magnification, but only to focus. In discussing the camera used at the autopsy, he explained: “It was a Graphic view camera...It was on a monorail that you focused back and forth. You had the different lenses for magnification...” In the 2006 book Terminal Ballistics, Karen Byrne confirms that this is as expected, stating “Occasionally, the photographer is required to know the focal length used to take a particular image...Because of the general superior quality, fixed focal length lenses are the preferred choice for forensic photography.” The 135mm Zeiss Jena Tessar handed over by the Navy was of fixed focal length. All this leads me to believe that the mystery photo as forehead is incompatible with the Graphic View camera supplied by the Navy, unless the mystery photo was *mistakenly taken with a wide angle lens*, and the photo then enlarged and cropped. While this seems ridiculous on the face of it, so is this entire discussion.

If a photo expert wishes to explain how increasing the focal length would decrease the size of the ruler in the background, I’ll include their explanation in my next update.

The Drainage Problem

At left: the mystery photo orientation of Richard Tobias. The drainage hole is smaller than in the top of the head photo at right, even though it would appear to be closer to the camera.

Some researchers claim the drainage hole proves the photo was taken of the forehead, and not the back of the head, But does it really prove the opposite?

Fox
Autopsy
Photos

At left: the mystery photo when sized to match the Tobias orientation. The beveled bone and reflected scalp in the photo are not angled away from the camera as in the Tobias orientation, but are in fact flat to the camera.

At right: a blow-up of the drainage hole in the mystery photo.

The Drainage Problem

Perhaps the biggest challenge to my understanding of the mystery photo came not from a single-assassin theorist, but from a fellow conspiracy theorist named Richard Tobias. After looking through my online presentation, Tobias e-mailed me his appraisal of the photo, which closely parallels Larry Sturdivan's appraisal of the photo. (Evidently, Tobias was an influence on John Canal, and John Canal was an influence on Sturdivan.) A circled feature in Tobias' image, however, and a key factor in Tobias's orientation of the photo, was a drainage hole visible on the autopsy table. This, admittedly, took me by surprise, as the images I'd been working with, available on such websites as JFK Lancer, had cropped off this drainage hole.

Annoyed that I'd never noticed this feature before, I immediately compared the drainage hole in the Tobias orientation to the drainage hole visible in the top of the head autopsy photo. I suddenly felt at ease. The drainage hole hadn't proved my orientation to be incorrect at all, but had given us yet another reason to believe the mystery photo depicts the back of the head. You see, the drainage hole in the Tobias orientation, purportedly by Kennedy's neck, was much smaller in comparison to his skull than the drainage hole in the top of the head autopsy photo, even though the hole in this photo was further from the camera, and beneath Kennedy's right shoulder. From this, I knew Tobias' orientation

was incorrect.

When I compared the Tobias orientation image to the actual mystery photo, I noticed even more inconsistencies. While the skull in the mystery photo appeared even, with the bone and scalp equidistant from the camera, Tobias had the skull angled sharply away from the camera in his orientation. This was undoubtedly misleading. The skull in the mystery photo is not curved in such a manner. There were also the ongoing problems with the forehead interpretation, including the whereabouts in the photo of the scalp from the left rear of Kennedy's skull.

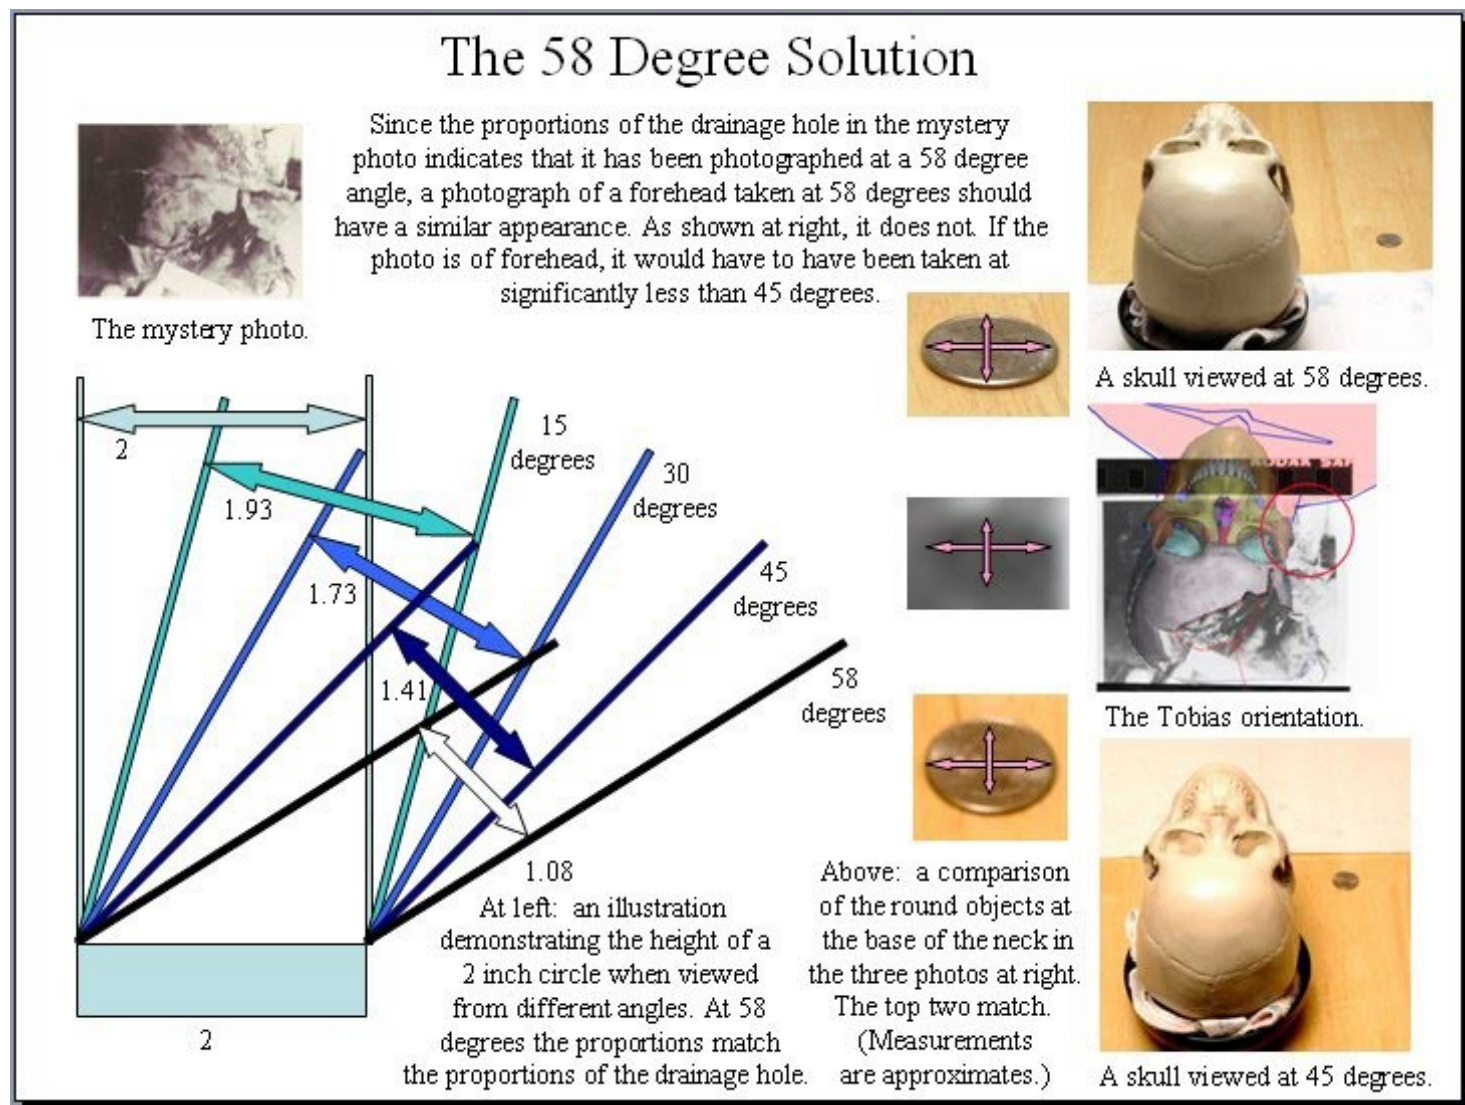

Looking Out or Looking Down?

The most convincing piece of evidence that the mystery photo was taken of the back of Kennedy's head when he was lying on his side, however, came when I measured the proportions of the drainage hole in the Tobias orientation, and compared them to the proportions of the drainage hole in the top of the head photo. Despite the fact that the Tobias orientation has the camera looking almost straight down on a prone Kennedy, and the top of the head photo has the camera looking at the autopsy table from only slightly above the horizon, the shapes were quite similar. While the hole in the top of the head photo measured roughly 40 x 87, the hole in the mystery photo measured roughly 47 x 87. Since a photo with the camera looking straight down would be 87 x 87, reflecting the round shape of the hole, this meant that the mystery photo was taken more from the side of the table than from above. (If anyone has any evidence suggesting the holes were not round, please speak up.)

It was at this time that I came across a photo of numerous stacks of coins. As the coins on the taller

stacks—closer to the level of the camera-- appeared more elliptical and less round, this photo allowed me to see that the approximate angle of the camera to the drainage hole could be determined.

The 58 Degree Solution

While I knew that the angle of the camera to the drainage hole could be determined by the hole's proportions, I couldn't remember how to do so. One's mind forgets a lot of math after 30 years of non-use. To solve the problem, then, I just began measuring the distance between two parallel lines rising from the edge of a two inch round shape at different angles. At 58 degrees from vertical, I found the proper angle to account for the 47 x 87 proportions of the drainage hole. When I took a photo of the Tobias orientation from 58 degrees, however, I found that the camera was looking at the top of the head, not the forehead. When I took a similar photo of the skull at 45 degrees, the camera was still not as high in the sky as the camera would need to be for the Tobias orientation to be correct. Tellingly, the round shape representing the drainage hole in the 45 degree photo was already far too round and not remotely similar to the proportions of the drainage hole in the mystery photo.

Anatomy of a Mistake

Below: a comparison of the coin and the drainage hole.

At right: the mystery photo.

At right: a blow-up of the steel edge and glass object in the mystery photo.

Above: a comparison between the glass object in the mystery photo and a glass sitting on a table.

At left: an attempted re-creation of the mystery photo. The proportions of the coin at the level of the neck are a close match to the proportions of the drainage hole in the mystery photo.

Above: the left lateral autopsy photo. Note that the edge of the steel head rest is at the same level as what appears to be a steel edge in the mystery photo (when interpreted as the back of the head on its side).

Anatomy of a Mistake

When I attempted to recreate the mystery photo with the skull on its side, however, I found that a camera looking down on the drainage hole from 58 degrees from vertical could indeed take a picture of the back of a skull as proposed.

But I can't gloat about this discovery. While studying the mystery photo, I noticed two other reasons to believe the mystery photo depicts the back of the head, and was quite mistaken on each. First, when comparing the mystery photo to the left lateral autopsy photo, I noticed that the steel edge of the head rest seen in the left lateral photo was at a similar height as what could possibly be a steel edge in the mystery photo. This seemed more than just a coincidence. Secondly, I noticed that an unidentified object under the neck in the mystery photo appears to be a glass jar sitting on the table. It seemed a bit of a coincidence that this glass shape appears to be right below the low entry wound on the skull, where tissue was removed during the autopsy for further inspection.

I was so convinced of the importance of these observations, in fact, that I created a slide for this chapter called "New Perspectives On Old Mysteries." The slide above is the same slide, only re-titled "Anatomy of a Mistake" to reflect my loss of faith in my impressions regarding the head rest and the glass. The recreation of the mystery photo on this slide, while proving its point, was also inaccurate.

At the root of all these mistakes was one mistake: I had the photo upside down. The photo depicts

Kennedy lying on his right side, not his left.

The Light From Above

A number of factors indicate this photo was taken when Kennedy was on his right side (as at top left). One is the lighting, which comes from above in this orientation, but not in the others. Two is that the light reflects from the far rim of the drainage hole in this orientation, as one would expect. Three is that, in this orientation, what appears to be a pool of blood at the base of the skull (as pointed out by the blue arrows) pools in a manner consistent with gravity.

The Light From Above

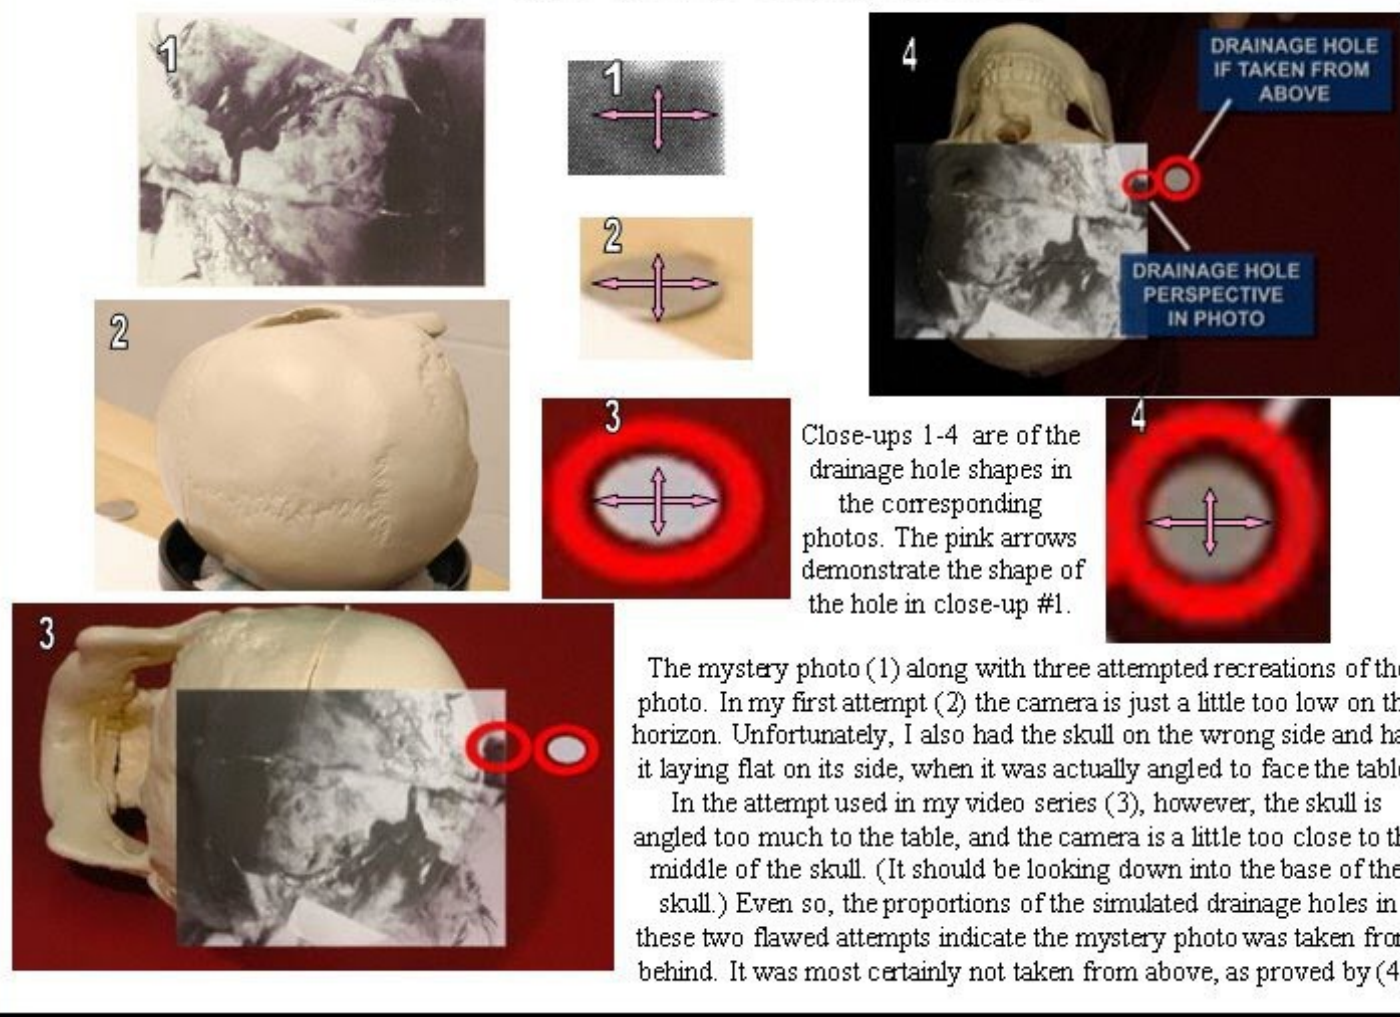

In November 2008, while working on part 4 of our video series, series director Braddon Mendelson gave me a call, and told me we had the photo upside down in our re-enactment. I went into my bedroom, whipped out the copy of the photo in High Treason 2 and took a good look. A few minutes later I called him back to confirm his impression.

I'd stupidly made the assumption that because the photo of the back of Kennedy's head before his scalp had been reflected showed him to be on his left side, the mystery photo was most likely taken with him on his left side. I'd taken my belief that I'd spotted a head rest and a glass in the photo as further confirmation he was on his left side.

But Brad, as a video director, wasn't looking at the photo with these pre-conceptions; he was looking at the lighting of the photo. And it seemed obvious to him the photo was lit from above. And he's right. The glare on the reflected scalp--apparently held in place by one of the doctors, indicates that the reflected scalp is above the skull cavity. Brad was also correct to note that the drainage hole would be lit on the inside of the far rim, and not the outside of the near rim.

After having seen this light, I noticed also that the "pool of blood" I'd previously noticed in the base of the skull was now consistent with gravity. I also noticed that, in this orientation, the triangle of scalp hung down from the head, and was similarly more consistent with gravity. In short, everything made much better sense in this orientation, except that darn metallic object I'd confused with a head rest and that darn glass object I'd confused with a beaker. I'm still not sure what they are, but perhaps they are tools used to reflect the scalp or hold it in place, once it's been reflected.

If At First You Don't Succeed

If At First You Don't Succeed

Having realized my earlier mistake, Brad and I set out to re-create the photo in its proper orientation. As demonstrated in photo 3 above, a still from Part 4 of our video series, we got pretty darn close. The camera seems to be at the proper vertical angle to the skull, but the slightly rounder "drainage hole" in our photo indicates the skull is tilted a little too much towards the table. The top of the skull should also be pulled back slightly toward the camera, so that the base of the skull more closely aligns with the base of the skull visible in the photo. But that's beside the point. We were simply trying to demonstrate that the shape of the drainage hole indicates the photo was taken from an angle incompatible with the bone in the foreground of the photo being forehead (as demonstrated in photo 4 above), and that the photo was therefore most logically taken from behind.

Even so, the thought occurs that an exact reproduction can be accomplished. If an experienced photographer with the right equipment wishes to try to more accurately recreate this photo, I will be glad to assist them in the positioning of the skull.

If at first you don't succeed...

Game, Set, No Match

At right: the mystery photo. Below: John Canal's photo of a mannequin head, supposedly taken from the same angle as the mystery photo. The angle of the camera to the bone at the center of the photos, however, fails to match.

When one compares the drainage hole in the mystery photo, above left, with the circle representing the drainage hole in Canal's recreation, above right, one finds further proof that his recreation is in error. The hole in the mystery photo is far more elliptical. This, then, proves the photo was not taken looking down into a skull laying flat on a table, as purported by Canal, but from much lower to the table.

The shoulder in his re-creation is also a problem. Where is it in the mystery photo? Canal's re-creation is simply wrong, wrong, wrong. Not that he'll ever admit as much.

Game, Set, No Match

In 2010, I became aware that author John Canal, who had devoted much of the past ten years trying to prove the mystery photo depicted Kennedy's forehead, had also claimed to have re-created the photo at the proper angle to the drainage hole. When his supposed re-creation was posted online, however, (ironically, by single-assassin theorist extraordinaire, John McAdams), I realized Canal was just blowing smoke. The proportions of the "drainage hole" in his re-creation were, as they are in all simulations of the photo in which the bone in the photo is forehead, not even close to the proportions of the drainage hole in the mystery photo.

His re-creation had other problems as well. As the camera was slightly closer to the table in his re-creation than it was in the Tobias orientation, more of the table below the skull should have been visible. So where was Kennedy's shoulder? The right shoulder of the mannequin in Canal's photo is clearly visible.

In sum, then, Canal's failure to re-create the image only confirmed what I'd been saying all along: the photo was taken from behind Kennedy, and depicts the back of his head.

Back of the Head?

The open cranium photograph as interpreted
by Dr.s Humes and Boswell in November, 1966.
The back of the head is in the foreground.

Or Forehead?

The open cranium photograph as interpreted
by Dr. s Humes and Boswell in January, 1967.
The forehead is in the foreground.

Back of the Head? Or Forehead?

Still, it seems quite possible all this discussion of the proper way to view this photograph is a waste of everyone's time, as it seems quite possible there are many men familiar with this photo who know full well its proper orientation. Former Attorney General Ramsey Clark, for instance, whose panel interpreted this photo as being taken from the front, told researcher James Douglass in 1998 that Jacqueline Kennedy was reluctant to return the autopsy photos in 1966 due to her fear the photos would fall in the wrong hands, and her children "would have to live with the head of their father pictured on the cover of Life Magazine...with *half the back of his head* blown off." Clark appears to have forgotten, or maybe he never understood, that his experts decided there was no photo depicting *half the back* of Kennedy's head missing.

When one looks at the report of Clark's Panel there is even more reason to suspect some sort of cover-up. Remember, the Clark Panel refused to attach any significance to the open-cranium photographs, stating: "*Due to lack of contrast of structures portrayed and lack of clarity of detail in these photographs, the only conclusion reached by The Panel from study of this series was that there was no existing bullet defect in the supra-orbital region of the skull.*" Similarly, the report of Dr. Richard Lindenberg for the Rockefeller Commission noted that the medical panel looked at a photo depicting

the “*cranial cavity with brain removed from above and from the front*” but failed to note the supposed beveled exit, or any of the other signs now considered so important. None of the other reports written for the Rockefeller Commission even mentioned the photo. My suspicion that this cover-up is organized was heightened, moreover, when I contacted a noted forensic pathologist, one who has regularly disagreed with his colleagues over much of the autopsy evidence, and asked for his help in understanding this photograph. Despite his previous offer to help me understand the forensic evidence, and my repeated attempts to contact him, he failed to respond. While this was most probably a coincidence, or a reflection of his personal distaste for discussing the photograph, there’s just too much other strange behavior surrounding this photograph to ignore.

Consider the case of Dr. Humes and Dr. Boswell, who changed their interpretations on this, the darkest, deepest, most disturbing autopsy photo, probably ever taken, and then supposedly forgot all about it. On November 1, 1966, on a list of the photos prepared for the National Archives, Humes and Boswell described the black and white photos taken from this position as “*depicting missile wound over entrance in posterior skull, following reflection of the scalp*” and the color transparencies taken from this position as depicting a “*missile wound in posterior skull, with scalp reflected*.”

On November 10, 1966, moreover, Humes and Boswell, along with autopsy radiologist John Ebersole and autopsy photographer John Stringer, signed a version of this report prepared by the Justice Department that changed these words only slightly, quite possibly as a result of a typo. This report described the black and white photos as depicting a “*missile wound of entrance in posterior skull, following reflection of scalp*.” The “over” had been changed to “of” and “the scalp” had been changed to simply “scalp”. The color transparencies taken from this position, not surprisingly, bore the same description as earlier.

On January 26, 1967, less than 3 months later, however, on the report of the examination conducted for the Justice Department, Humes and Boswell said these photos “*show the other half of the margin of the exit wound; and also show the beveling of the bone characteristic of a wound of exit*.” They went on to state that two of the photos “*show that the point of exit of the missile was much larger than the point of entrance being 30 mm (1.18 inches) at its greatest diameter*.” As Dr. Humes in his testimony before the Warren Commission in 1964 and Dr. Finck in his letter to his commanding officer in 1965 expressed that there was no beveled exit visible at the large defect, outside the beveling on one of the recovered skull fragments, and as Dr. Boswell failed to mention any beveling on the intact skull when interviewed by Josiah Thompson on 1-11-67--only NINE days before the doctors' January inspection--the January report's description of a beveled exit visible on the intact skull is yet another reason to believe this so-called Military Review was written by someone other than the doctors.

Two years after the “Review,” in fact, during the trial of Clay Shaw, Dr. Finck seemed unaware he’d even signed a document claiming there was beveling on the intact bone. He testified “*I could make a positive determination of a wound of exit, of a portion of a wound of exit, in a bone fragment submitted to us during the course of the autopsy...it was during the course of the autopsy this fragment was brought to us and allowed us to determine that this was the wound of exit*.” For his part, Dr. Humes seemed conscious of the change. He told the ARRB in 1996 that when inspecting the exit defect, he found that “*the bone fragments that were placed—that remained in place, halfway in place—were shelved on the outer table of the skull. And when we got the fragments from Dallas...we almost could complete the circle of what appeared to be the actual exit wound*.” Perhaps the knowledge of this fabrication has haunted even Humes, however, as neither he nor the other two original autopsists has ever pointed out this beveled exit on the autopsy photos when given the chance.

When asked about this photo by the HSCA forensics panel for example, Humes and Boswell escaped without committing themselves one way or the other. They were shown the color version of this photograph by Dr. Petty and asked “*Could you, Dr. Humes or Dr. Boswell, either one, from*

examination of the photograph purported to show the posterior cranial fossa locate the point of in-shoot into the skull? Now we're looking at photograph No. 44." Dr. Humes then responded *"How about here, Jay?"* and began discussing it with Dr. Boswell, who became confused, which then led Humes to conclude *"I don't think the photograph permits us to say with accuracy where it is."*

The HSCA had even less success with Dr. Finck. When asked if he'd seen any evidence of an exit defect at the margin of the large defect, as proposed in the January 1967 report written for the Justice Department, Finck played it safe and replied *"I don't recall."* When then shown photo 44 and asked if it refreshed his memory, he held his non-committal ground, stating *"No."* When counsel Andy Purdy then pushed a little harder, and asked Finck if he saw *"anything on that photograph which would represent the exit hole of a bullet?"* Finck once again played dumb, stating *"I don't know what this is."* When a clearly exasperated Purdy then pointed out the beveled notch in the photo, and asked Finck if this semi-circle could be an exit wound, Finck stood by his story, stating *"No. Hazy, blurred."*

When asked about this photograph by the ARRB in the late 1990's, moreover, the doctors continued to play it safe. Despite their unanimous recollection of a photograph being taken of the occipital region demonstrating the wound of entrance after the brain had been removed (tellingly, none of them remembered taking a photograph of the frontal bone demonstrating the wound of exit after the brain had been removed), when shown this photograph, all three claimed they were unable to figure out even which part of the skull it represented!!! Humes: (When asked to orient the photographs) *"Boy, it's difficult. I can't. I just can't put them together... Very disappointed. No, I can't...they're disappointingly confusing to me...There's what appears to be a notch in a major portion of bone here centrally located, but I'm not at all sure about it. I don't know what it is or—I can't get oriented at all. I just can't;"* (when shown an earlier description of the photo) *"down here opposite the edge of the ruler, I presume that, is what we're talking about right there...I have to presume is what we're talking about right there...I don't know. I have trouble with this. I can't really recognize it there."* Boswell: *"I'm sorry. I can't orient this at all...I'm afraid I can't...what we were attempting to show here, I don't know;"* (when asked if the hole in the skull appears towards the front) *"I can't be sure;"* (when confronted with his earlier descriptions of the photo) *"I can't identify anything else in here to tell where we are...This is what appears to be calvarium, a piece of bone plate, skull plate...And if you look at this beveling of the bone here, this would be a wound of exit...there's no way this could be called a wound of entrance, now the only other thing is that if—on the reflected scalp here, there is a wound or something...It's such a dilemma."* Finck: *"I cannot say much about this...I have difficulties to orient this;"* (when shown the semi-circular notch that Boswell latched onto as possibly showing outward beveling and asked if it helped him remember what the photo depicts) *"No."*

When asked by the ARRB the million-dollar question of why they changed the official interpretation of the photograph between November 10, 1966, and January 26, 1967, for that matter, the memory of these lifelong medical men grew even foggier. Humes: (when asked if he even remembered the January report) *"If you've got such a statement, I presume we did. I don't remember the details of it...I don't know who wrote this, it doesn't seem like I wrote it, just because of the phraseology and some of the comments...I don't recall anything about it. I really don't. I don't recall it. Other than—other than the earlier, longer report that takes the photographs number by number."* Boswell: *"This is Jim's (Dr. Humes') language, I think;"* (When confronted with the two different interpretations of photo #44) *"I think they were both wrong, and I think the reason is that it's just such a terrible photograph;"* (When asked why they changed the description) *"I don't remember that Pierre (Dr. Finck) came over for that... Well, that may be the answer right there. See, Pierre was a forensic pathologist, and he was extremely able relative to ballistics. And he may have talked us into this. That's the only thing I can think of."* Finck, however, remembered no such thing: (When asked if he'd ever seen the January report) *"I don't know when, but I think I did;"* (When asked if it was his signature at the bottom) *"I*

recognize my signature;” (When asked if the report was written by the doctors or by someone else) “Oh, *I wouldn’t have signed this if it had been written by somebody else. I am pretty sure I participated in this.*” (Let’s recall here Dr. Finck’s 1967 report on this very review, in which he wrote: “*the statement had been prepared by the Justice Department. We signed the statement.*”)

These life-long pathologists reversed the official interpretation of the most significant autopsy photograph anyone had ever seen, and then forgot all about it? I must admit I’m skeptical.

Dr. Humes, I suspect, knew exactly what had happened. His February 13, 1996 testimony before the ARRB has some revealing exchanges. Few more so than this--

GUNN: *When you were referring to that photograph in your previous answer, were you referring to the photographs from View 7 that are in front of you now? (NOTE: these are the mystery photos) You can hold off on the answer. Maybe if you can--if you could just--*

HUMES. *Well, these are quite obviously from the outside of the skull. They're not from the inside. That's perfectly obvious. So I don't see one from the inside of the posterior cranial fossa where the defect was. And I'm disappointed because I thought we had such a photograph.*

So there you have it. Humes told the ARRB he had no recollection of the January '67 report in which the mystery photo was purported to depict a beveled exit on the front of the skull, and only recalled the “*earlier, longer report*” in which it was purported to depict a “*missile wound of entrance in posterior skull, following reflection of scalp.*” He then proceeded to reject completely that the photo depicted the “*posterior cranial fossa where the defect was.*” By saying the interior of the skull depicted in the photo was not “*where the defect was*” (low on the back of the head), however, Humes was as much as admitting that the “outside of the skull” depicted in the photo was not the forehead. He was, in effect, telling Gunn, AND the world, that the photo, taken “*quite obviously from the outside of the skull,*” showed what he’d claimed it had in the “*earlier, longer report*” he recalled, i.e., a “*missile wound of entrance in posterior skull, following reflection of scalp.*”

Still, the possibility exists that the doctors couldn’t make sense of the photo because it had been cropped in some way. My concern for this was heightened after reading Dr. Boswell’s 1996 interview with the ARRB. When asked if he remembered seeing any of the photographs now purported to be missing, including the one Dr. Finck remembers taking of the entrance on the back of the skull, he told them “The one of the skull wound, I thought I remembered seeing it, but I--now, I’ve seen a lot of pictures like in Livingstone’s books, where those come from, I don’t know. And whether they’re fabricated, some of them, or not—and I may be confusing pictures I’ve seen that are alleged to be autopsy photographs.” He is referring, of course, to Harrison Livingstone, whose book *High Treason 2* included the Fox set of autopsy photographs. That Boswell was unsure if these photos were real, and thought he saw a photo of the entrance on the skull among them, and then FAILED to orient the skull photos he was shown minutes later by the ARRB, made me suspect the photos in the archives did not match the Fox set. Fortunately, there are others who swear they are the same.

In 1993, Dr. Robert Artwohl told an audience that the Fox set of photos was genuine and matched the photos in the archives, but that the archives photos were much clearer. He also stated that the area appearing to be neck was really a yellow block and that the scalp was reflected onto Kennedy’s left forehead. In 2004, Dr. Chad Zimmerman and Larry Sturdivan came away from their visit to the archives with slightly different impressions. On Zimmerman’s website, he recounted his visit to the archives. He mentioned that the Fox photo posted on his website is “significantly cropped as compared to the color prints” at the archives. This is a confusing statement. As the black and white prints are reportedly separate photos, taken moments apart, they are not “cropped” but are instead photos taken from closer to the skull, with a smaller field of view. By saying “cropped” Zimmerman implies there are images on the black and white negatives that were not printed, something he would have no way of

knowing unless he studied the negatives. Since the doctors were not studying negatives, but prints, the thought occurs that Boswell's confusion may have come from the progressive lightening of the "mystery photo" by researchers seeking to highlight what appears to be lines on the back of Kennedy's neck; perhaps the original is very dark. Still, Artwohl, Zimmerman and Sturdivan see so many things on the photos that are not apparent on the Fox set of photos, it really makes one wonder--are the photos at the archives different than those on the internet?

Dr. David Mantik, thankfully, helps clear this up. After nine visits to the archives, he concurs with Zimmerman that the black and white photos #17 and #18, which have a smaller field of view, are difficult to orient, but says that photos #44 and #45 were "taken from the rear" and that studying them was "essential" to his conclusion that there was a large defect in the right rear of the skull—a conclusion one could not make if interpreting the bone in the foreground as forehead. Since his conclusion is in opposition to the conclusions of Artwohl, Zimmerman, Sturdivan, the HSCA Forensic Pathology Panel, and the Clark Panel, and since Dr. Mantik is one of the few conspiracists ever allowed to see the photos, this leads me to suspect that one's interpretation of the photos is based as much on what one expects to see as what is actually there. As the autopsy doctors were shown all 4 photos by the ARRB, then, their inability to make a decision appears to be unrelated to the subtle differences in field of view described by doctors Artwohl, Zimmerman, and Mantik, and everything to do with their refusal to commit to an interpretation of the photo. Since they are strangely the only three single-assassin theorists to see the open-cranium photos and not assert they were taken from in front and above, one can't help but suspect this is because they *know* the photos were not taken from that perspective. On the other hand, this amazing coincidence might have come as a result of the doctors' peculiar predicament. If they said the photos were taken from the front, they would be at odds with their original inventory of the photos created in 1966, the one they *remembered* creating. If they said they were taken from the rear, on the other hand, then they would be at odds with the Military Review they signed a few months later, not to mention all the doctors who examined the photos for the HSCA. Playing stupid may have simply been their way of avoiding controversy.

Even so, it's hard not to take the doctors' refusal to make an interpretation as an additional reason to believe they were forced to lie back in '67. Let's not be naive. In November, 1966, they identified a piece of bone on which a beveled exit seems apparent as bone on the posterior skull. Then, but a few days later, former Warren Commission counsel Liebelser sends out a letter to, among others, fellow former counsel David Slawson, now working directly for the Justice Department as an attorney for President Johnson in the Office of Legal Counsel, detailing the eyewitness evidence for a shot fired from the front, and exiting from the posterior skull. Then, in January 67, after the Justice Department decides that another report is needed, in part to assuage CBS News, which is starting to look at these issues, the photo of the bone on the posterior skull is re-interpreted, and is now presented as a photo of an exit on the front of the skull by the forehead...a photo that couldn't even exist, according to the sworn testimony of Kennedy's chief autopsist, Dr. Humes. Now, perhaps the doctors by January 67 had simply forgot what they'd said previously, and had honestly come to believe the photo was taken from the front. Stranger things have happened. Well, if they honestly believed the photo was of the forehead then, why not restate so later, with so many prominent pathologists on their side? It just doesn't wash. Someone's hiding something.

(FWIW, in Volume 3 of his 5 Volume epic, Inside the Assassination Records Review Board, Doug Horne posits that this photo was indeed a photo taken of the back of the head. As Horne believes the autopsy photos, x-rays, and Zapruder film have all been faked, however, he holds that the beveling apparent on the back of the head was also faked, and added in by some government employee under the belief the photo was taken from the front. This makes little sense, IMO. Such beveling was not described in the autopsy report. If Dr. Humes was instrumental in the cover-up, and had personally

supervised the alteration of Kennedy's wounds, as Horne posits, why would he not be told that, oh yeah, we've added an exit onto the forehead of one of the autopsy photos, and you're to write about this in your autopsy report and testify about this should you be called to testify before a government commission? If Horne claims this was done without Humes' knowledge, after the completion of his report, furthermore, it makes even less sense. I mean, we know the photos in the archives are identical to those copied by James Fox but a few days after the assassination, and subsequently made available to the research community. So...are we to believe someone added an exit wound to the forehead in an autopsy photo within days of the shooting--but failed to tell the doctor whose testimony would be required to place such a wound into evidence? I don't think so.)

The "Missing" Missile Wound

While the hole at left demonstrates the "tunneling" reported by the doctors, the hole at right shows little if any of the beveling reported by Dr. Finck to the Warren Commission.

Fox autopsy photo

The HSCA's report asserted that the hole by the arrow at right is a semi-circle. It also proposed it is the inside view of the HSCA's "cowlick" entrance. As this hole is considerably below the ruler, which appears to be below the level of the supposed "cowlick" entrance, this makes little or no sense, even to single-assassin theorists.

Which one of these holes represents a "missile wound over entrance in posterior skull, following reflection of the scalp"?

The "Missing" Missile Wound

As clear as it is to most that the doctors changed their interpretation of the mystery photo between November 1966 and January 1967, there are those who insist this is a conspiracy myth. Dr. Chad Zimmerman, for example, is so convinced that the photo shows forehead that he refuses to believe the doctors ever could have thought it was the back of the head. Accordingly, he has convinced himself that the doctors' 1966 description of a "missile wound over entrance in posterior skull, following reflection of the scalp" is not a description of the back of Kennedy's head at all, but a description of the front of

his head, showing the *interior aspect* of the missile wound in the posterior skull, and the scalp reflected over the forehead. Never mind that it says "over entrance in posterior skull," implying that the photo is of tissue just above the skull. Never mind that "following reflection of scalp" modifies "posterior skull" and not "anterior skull" or "forehead." Never mind that there is no mention that the entrance is inside the cranium anywhere in the photo's description.

Vincent Bugliosi, in his 2007 opus *Reclaiming History*, drifts even further out to sea than Zimmerman. On page 261 of his endnotes, he asserts that the allegedly missing autopsy photo of the entrance on President Kennedy's head is in fact in the collection. He asserts that this photo of the president's skull with his brain removed was properly described in the November 1, 1966 inventory of the autopsy photos. As stated, this inventory claims the photo depicts a: "missile wound over entrance in posterior skull, following reflection of the scalp." In January 1967, of course, the doctors changed their interpretation of this photo, and said it depicted an exit on the president's forehead. Bugliosi, in keeping with Zimmerman, refuses to acknowledge that they changed their interpretation, however, and instead asserts on page 238 and 262 of his endnotes that both descriptions were correct, and that the photo depicts the interior of the back of the head when viewed from the front, as well as the beveled exit on the frontal bone in the foreground of the photo. To explain why there was no mention of the beveled exit on the skull prior to the January 67 review, Bugliosi suggests that the doctors, who'd only spent 6 hours or more staring at the president's body, looking for bullet wounds, only discovered this exit during the 1967 inspection of the photos.

Bugliosi goes on to make a statement that distances himself from Zimmerman, however. On page 261 of his endnotes, Bugliosi states "The HSCA forensic pathology panel subsequently concluded that the images depicted both the entrance wound bevel (in the background of the image) and the exit wound bevel (in the foreground of the image)." He implies this conclusion supports his analysis of the 1966 and 1967 reports, and his contention that they really aren't in conflict.

Well, there's a number of problems with this. One problem comes from the exact wording of the passage cited by Bugliosi. On page 129, the HSCA panel's report claims "a possible portion of the beveled inner table corresponding to the semicircular margin of the entrance wound at the back of the head" can be seen in the depths of the mystery photo. Later, however, it claims an "anterior bone fragment" with a "semicircular defect" is visible in the photo. This is clearly the supposed exit. Bugliosi's circle is therefore complete--both an entrance and an exit are discussed in relation to the photo. The report is therefore claiming that both an entrance and an exit are visible in the photo.

But it is not to be believed. The key to understanding why is the phrase "semi-circular margin of the entrance wound at the back of the head." Well, there was NO semi-circular margin of an entrance wound at the back of the head. None was described at autopsy. None was discussed in the testimony of Dr. Humes before the Warren Commission. None was discussed in the testimony of Dr. Baden before the HSCA. While, on page 107 of the pathology panel's report, it is claimed that "Stereoscopic visualization of the inside of the cranial cavity at its depth, after removal of the brain, reveals a semicircular beveled defect of the inner table in the posterior parietal area to the right of the midline, from which fracture lines radiate corresponding to the entrance perforation indicated in the skull X-rays" it seems clear the writer of this passage was just blowing smoke. The ONLY "semi-circular margin" on the skull discussed previously, after all, was the supposed exit in this very photo.

Still, even if one were to grant Bugliosi that the HSCA report supports that the photo shows both an entrance and an exit, and that there is nothing problematic about the supposed entrance supposedly visible in the depths of the mystery photo, one can't claim all is well. You see, the '66 and '67 reports Bugliosi has tried to reconcile are unanimous in that the entrance wound depicted is the entrance described at autopsy...on the occipital bone. And the so-called "cowlick" wound described in the HSCA report is on the parietal bone, four inches away.

This yields surprising complications. You see, every, and I mean EVERY, single-assassin theorist researcher concluding the mystery photo was taken from the front, and shows an entrance in its depths, has concluded that the entrance shown is the one described at autopsy. This EVERY includes Larry Sturdivan, the HSCA's wound ballistics expert, Dr. Chad Zimmerman, and author John Canal, all of whom were in contact with Bugliosi during the writing of his book. And it's easy to see they are right. When one interprets the photo as being taken from the front, it becomes obvious that the hole in the back of the skull is in a ridge of some sort. As there was no such ridge anywhere near the cowlick entrance, moreover, it becomes obvious that this entrance is the one by the EOP noted at autopsy. When one views the photo in this light, moreover, it's debatable there's any bone by the cowlick in which there could be an entrance!

Bugliosi's rejection of his advisers' opinions on this point is indeed strange. On page 238 of Reclaiming History's end notes, Bugliosi declares "the keys to the correct orientation of the images are a lip of a glass specimen jar on, and a drainage hole in, the autopsy table, which are both visible in the photographs and are located at the top of the autopsy table. These details show that the photographer was standing at the head of the autopsy table, looking down into the cranial cavity, with the president lying on his back." This could have been written by Canal, who has been making similar claims for years. So why didn't Bugliosi mention that Canal, Sturdivan, and Zimmerman, among others, believed that the photo demonstrates an entrance on the inside of the skull in the location described at autopsy? His book, after all, was supposedly designed to answer all the questions, settle all the disputes. So why didn't Bugliosi mention that some of his advisers on the autopsy photos and medical evidence--Canal, Sturdivan, and Zimmerman--adamantly disagreed with his interpretation of the photo? Why didn't he acknowledge that they'd used this photo to conduct all sorts of tests, and that their tests uniformly proved that his #1 expert, Dr. Michael Baden, who'd testified before congress with this photo upside down after conducting NO tests on the photo, was incorrect in his understanding of the photo, and of the entrance wound location? Why didn't he settle this dispute, or even acknowledge its existence?

Perhaps he was far too subservient to "experts" like Michael Baden to tell his readers they were wrong, no matter how obvious it was to everyone else.

Or perhaps Bugliosi really had no interest in settling disputes, but was concerned instead with giving the appearance of settling disputes. Perhaps he felt it would prove "counter-productive" to admit that the "experts" to whom he so readily defers can't even agree on something as basic as the location of the bullet entrance on the back of Kennedy's head.

Note: on 10-1-10, on the alt.assassination newsgroup, John Canal, whose strident belief the mystery photo was taken from the front actually exceeds my strong belief it was taken from behind, responded to the above slide by as much as admitting he had no explanation for the bullet hole depicted on the left side of the slide. In his orientation, remember, this apparent bullet hole is on the left side of Kennedy's skull. Here is his response (with spelling errors corrected):

Pat, for us to continue discussing this F8 orientation issue makes no sense...we are obviously at a stalemate....and have been for a few years.

Besides the replications that show the face on orientation is correct, I have the signed statement of the autopsy photographer that says the same thing.

In fact, I can't think of one forensic expert who has examined the originals and concluded the back of JFK's head is in the foreground in F8. If I missed anyone, I'm remiss, but would add there's certainly not too many.

Also, you have the bone flap, most easily seen hanging of the front right of his head, hinged by the scalp, in the BOH photos, but also seen in--of course--the same place in F8.

Lastly, I'm baffled at how you have the gall to try to convince us to accept your misorientation of F8 over its face-on orientation as diagrammed by the HSCA's highly credentialed forensic anthropologist, Dr. Lawrence Angel....who examined the "originals" and probably did it with a stereoscopic viewer. No one was more qualified to determine the correct orientation than he was.

Pat, I'd appreciate it if you'd respect my wishes for us to not to discuss this F8 orientation issue, or any issues related to its orientation, anymore.

Thank you.

--

John Canal

Notice that he fails to discuss the issue at hand, and instead lists some red herring reasons why he "knows" he's right. The bullet hole disproves his orientation, and he can't bring himself to admit it.

Chapter 15: The Tangled Web

An examination of the HSCA's trajectory analysis, and its dishonest treatment of the head wounds

HSCA Outshoot / Autopsy Photos Comparison

Fox Autopsy Photo: left side image inverted and red star added for comparison.

Left: HSCA Exhibit F-58

Groden Autopsy Photo

For reasons beyond my grasp, the first image in each chapter sometimes fails to appear. If there's nothing up above, don't despair; you can still see the image [here](#)

HSCA Outshoot/Autopsy Photos Comparison

Once one gets past the shocking fact that the HSCA pathology panel couldn't tell the back of Kennedy's head from his forehead, one can begin to understand the incredibly confusing tangle of contradictory information that is the HSCA's depiction of the head wounds.

When one compares exhibit F-58 with the autopsy photos one finds that in their attempt to make sense of the beveled bone on the forehead in the mystery photo (which I hope you now agree is not a mystery) the forensic pathology panel adopted an outshoot on the President's right forehead just above his temple. One not insignificant problem with this is that this location is visible through the v-shaped tear in Kennedy's scalp apparent in the right lateral autopsy photo. That solid bone seems to be all around this location, and that the tear of scalp appears to have come as a result of an explosion from somewhere above the President's ear, at least an inch away, only highlights how unlikely it is for this location to be the location of the outshoot. There is simply no large hole here. While there is no shortage of missing skull back of this location, this is just not the exit location for the largest fragment

of the bullet.

But like a row of dominoes, one mistake led to another, and then another, and then another....

The Tell-Tale Art

A quick comparison between Warren Commission Exhibit CE 388 and Exhibit F-66 of the HSCA Forensic Pathology Panel shows that the HSCA adjusted the Warren Commission's findings in order to depict both the proper position of Kennedy's head at the moment of impact and the higher bullet entrance proposed by the Clark Panel.

So WHY doesn't HSCA Exhibit F-141, below, the "calibration photo" used by the HSCA's trajectory analyst to determine Kennedy's precise position at the moment of impact, correspond to the forward lean apparent in F-66 and the Zapruder film?

Zapruder frame 312 (or Z-312), Kennedy's position just prior to the impact of the fatal head shot.

Warren Commission Exhibit CE 388, the autopsy doctors' depiction of Z-313

HSCA Exhibit F-66, the Forensic Pathology Panel's depiction of Z-313.

HSCA Exhibit F-141, purported to correspond to Z-312

At left: Zapruder frame 313

The Tell-Tale Art

When one looks through the various HSCA exhibits, particularly those regarding the head wounds, one gets the distinct feeling one is walking through a house of mirrors. Unlike the Warren Commission exhibits, which, while occasionally misleading—let's not forget the Rydberg drawings—were at least for the most part consistent with one another, many of the HSCA exhibits are in complete disagreement with one another, and even with the established evidence.

When one looks at Exhibit F-66, for example, which we've already demonstrated was in disagreement with the autopsy photos of the back of Kennedy's head, one can quickly observe that it was in disagreement with the Zapruder film as well. While Zapruder frame 313 shows the explosion of Kennedy's skull occurring on the front half of his skull, F-66 shows it to begin behind his ear, at the rear of his skull.

It should be acknowledged, however, that this exhibit, which seems to be in disagreement with every other exhibit, is absolutely correct on one pertinent detail: the drawing replicates Zapruder frame 312 and depicts Kennedy leaning forward 27 degrees at the moment of impact. Since the drawing has the

bullet descending 20 degrees, one can take from this that the bullet ascended 7 degrees in Kennedy's skull. If one projects 20 degrees backwards from Kennedy's position at Z-312, moreover, one can create a trajectory that hits the school book depository within 20 feet of the sniper's nest. This would be close enough for most not already skeptical.

The HSCA, on the other hand, apparently wanted something more precise. They hired a trajectory expert from NASA, Thomas Canning, and asked him to establish the precise locations of the shooter or shooters by connecting the wounds, establishing the positions of the victims at the time of the shots, and projecting backwards. When Canning looked at Zapruder frame 312, amazingly, he came to the conclusion Kennedy was leaning but 11 degrees forward.

Thus, the only HSCA exhibit that accurately depicts Kennedy's position at Z-312 was ignored in favor of a calibration photo, a photo created for Canning using an anatomically accurate mannequin, which was placed in different positions and photographed until Canning could find one that supposedly matched Z-312.

Does it match?

Mixed-up Confusion

Should one wonder if there were legitimate reasons for the HSCA to hire Thomas Canning, one need only compare two exhibits presented in the testimony of Dr. Michael Baden on 9-7-78. When one compares the trajectory drawing F-66 with F-58, the lateral view of Kennedy purportedly depicting his wounds, and rotates F-66 the 27 degrees necessary to present Kennedy's nose even with his EOP (the bump on the back of his head) one finds that the bullet ascends 7 degrees in Kennedy's skull in F-66,

but descends 3 degrees in Kennedy's skull in F-58. This means there is a 10 degree discrepancy between the two drawings. Equally disturbing is that, while both entrances are the same distance from the lambda suture at the back of Kennedy's head (where the parietal bone meets the occipital bone), the entrance on F-66 is lower. The suture moved with it. While one might counter that F-66 was drawn in haste and even depicted Kennedy's ear and nose in the wrong position in comparison to the back of his head, this doesn't really help support the accuracy of F-58, once one remembers that F-66 accurately depicted Kennedy's position at Zapruder frame 312.

When one looks at Zapruder frame 312, one can notice a dark line running across the frame. This would appear to be a shadow in the gutter on the south side of Elm Street. Since this line appears to be even, and Elm Street was at a 3 degree decline, this would indicate that Zapruder's film was created at a slight angle. This would indicate that any projections based on Z-312 should be adjusted by 3 degrees. This also means the 27 degree forward lean of Kennedy at Z-312 was really a 30 degree forward lean against the horizontal. While this means the bullet descent in F-66 should rightfully be 23 degrees, which would project back to a point roughly 6 feet above the roof of the school book depository, it means the bullet descent in F-58 should rightfully be 33 degrees, which would project right back to the sniper's nest window, *should the school book depository have been stacked atop a building identical in size!*

The problems with establishing bullet trajectories to or from a head wound with no clear-cut exit have been noted by many, including Dale Myers. Larry Sturdivan, the HSCA's ballistics expert, reflecting on the badly damaged nature of the bullet, has written: "the odd-shaped piece of a bullet is inevitably unstable and will develop some degree of lift that will curve its trajectory in tissue...Of the thousands of examples of yawed, deformed, and broken rifle bullets fired into gelatin tissue stimulant at the Biophysics Division lab and other similar facilities, none had a perfectly straight trajectory. Few are even close...The wound locations have no value in reconstructing the exit trajectory of a yawed or deformed bullet or bullet fragments." In his testimony before the HSCA, Sturdivan was equally dismissive of using the head wounds to project back towards the sniper's nest. He told them "no bullet goes straight when it enters a solid mass." In their final report, the pathology panel concurred with Sturdivan, doubting their ability to accurately reconstruct the paths of intact bullets as well as fragments: "The panel is concerned as to the degree of accuracy attainable in determining the missile trajectory based on backward extension of a bullet track from within the body, particularly if precision within the range of a few degrees is required. An intermediate or high velocity bullet creates a temporary bullet track relatively larger than that of the bullet itself. This precludes reconstruction within the required degree of accuracy." While these statements can be taken as a disavowal by the doctors of the work of Thomas Canning, they should have acknowledged the added difficulty they created for him by misinterpreting the autopsy photos and forcing him to try and link an entrance that was not entrance to an exit that was not an exit.

Forward Lean Comparison

Forward Lean Comparison

Spotlight on Thomas Canning, the HSCA's trajectory analyst. While little is known of his hiring, it's clear it came late in the game. A 2-27-78 HSCA executive session transcript reveals that chief counsel Robert Blakey was pushing for the usage of the Rochester Institute of Technology at USC to not only test the photographs, but "to give us the measurements that we worried about—that is, where Kennedy was. They are very confident that they can reconstruct the President's skull and project in whatever direction back from the head the projectory (sic—trajectory) analysis." This indicates Canning was hired as an afterthought, and had little time to prepare for his 9-12-78 testimony. This is reflected in his work. Although he was introduced by Blakey as an over 30 year employee of NASA and as an expert in flight trajectory, his testimony is as problematic as can be, forcing one to ask the question: can brilliant men really be this stupid? When one reflects that Canning was given the authority to disagree with the Forensic Pathology Panel, and had the right to move or re-interpret President Kennedy's wounds at his discretion, one might rightly wonder whether Canning was hired more as a salesman than as a scientist.

Even so, when one compares the various exhibits prepared by the HSCA, and Canning's final conclusions, the HSCA house of cards meets a hurricane. While Canning found that Kennedy was leaning forward anywhere between 11 and 18 degrees (from the road surface, which was descending at 3 degrees across the plaza) at frame 190, he was quite convinced Kennedy's head was leaning forward at precisely 11 degrees (from Zapruder, who was standing on a flat pedestal) at frame 313. Since he decided to go with a forward lean of 14 degrees for frame 190, based upon the previously mentioned 11 to 18 degrees he interpreted as Kennedy's forward lean in the Croft photo taken at Z-161, this meant

then that he believed Kennedy was leaning slightly forward at frame 190, was hit in the back, *and then sat up* before being hit in the skull at 313. This is exactly the opposite of what the Zapruder film reveals. ANYONE who has seen the film can tell you that Kennedy reaches for his neck, slumps forward, and then gets shot in the head. Since the eyewitness testimony is filled with references to Kennedy slumping after first being hit, moreover, it would appear Canning believed Kennedy somehow slumped *upwards* in his seat.

All it really takes to determine something is wrong is to compare the aforementioned Croft photo, in which Kennedy is supposedly leaning forward 14 degrees from the road surface (thus, 17 degrees against horizontal), with Zapruder frame 312, which supposedly depicts Kennedy leaning forward 11 degrees from Zapruder (and thus only 8 compared to the road surface). It's impossible to imagine that anyone could actually believe that Kennedy was leaning considerably further forward in the Croft photo than he was at Zapruder frame 312, and yet that is exactly what Canning's analysis contends. Is it possible that single-assassin theorists, including historian John McAdams, who promote Canning's conclusions, really believe this? While one might rightly point out that my comparison of 17 degrees to 8 degrees reflects a comparison of the forward lean of Kennedy's torso versus the forward lean of his head, it is obvious that Kennedy's head is leaned far more forward of his body at Z-312 than in the Croft photo. Consequently, in order for Kennedy's head to be leaning forward only 8 degrees from the street at Z-312, his torso must be bent over backwards. It's not. As a result, one can only conclude Canning was either incompetent, insane, or a liar.

This is made even more obvious by looking at exhibit F-46 of the pathology panel. This drawing, depicting the forward lean required for the single-bullet theory to work, depicted the president leaning twice as far forward as he was in the Croft photo, which Canning said supported the theory. And yet, the figure in this drawing has an almost identical forward lean to Kennedy at frame 312, a frame in which Kennedy is supposedly sitting more upright than in the Croft photo!

Animator Dale Myers also believes Canning's work on the head wounds was seriously in error, and has concluded that Kennedy is pitched forward 27 degrees at Z312. Holy smokes, we agree on something!

The Big OOPS

HSCA Exhibit F-137, depicting a flat trajectory through the skull.

JFK Exhibit F-141

HSCA Exhibit F-141. Kennedy's head is pitched forward 11 degrees

HSCA Exhibit F-139, September 12, 1978, depicting a bullet descending 13 ½ degrees through head, 17 through air.

HSCA Figure II-12, March, 1979, depicting a bullet descending 13 ½ degrees through head, 18 through air.

The Big OOPS

When one looks at the exhibits Thomas Canning presented in his testimony and report, one can only be amazed that so many take his trajectory analysis seriously. Seriously flawed, yes, but serious evidence that the shots all came from the school book depository? Afraid not. To begin with, there was exhibit F-137. Canning described this exhibit as follows: "If one draws a line straight from the in-shoot wound in the right lateral projection, it turns out to be very close to 90 degrees relative to the external facial axis..." From this it's obvious this exhibit was supposed to depict a flat trajectory through a skull in the upright position. Problem is that the trajectory was neither flat nor the skull in the upright position.. That the skull in the diagram was not upright is made clear by comparing it with the calibration photo created by Canning to represent Zapruder frame 312 and the supposed position of Kennedy's skull at the time of the headshot. The slope of the top of the head is so similar on the two exhibits that at first I thought F-137 was designed to represent the skull at Z-312. A close reading of Canning's testimony, however, reveals that F-137 is supposed to be an upright skull while the head in the calibration photo is supposed to be pitched forward 11 degrees. That the forward pitch is indistinguishable between the two should have alerted someone that something was wrong.

But that's just the beginning. When one considers that a flat trajectory through a skull pitched forward 11 degrees would project backwards at an 11 degree angle through the air, one can't help but wonder why Canning's exhibit F-139 depicting the head wound trajectory displays a 13 ½ degree descent through Kennedy's head on the close-up insert. Even worse, it has a 17 degree descent from the window next to the sniper's nest into the car on the longer view. As the FBI measured a 15 degree angle from the sniper's nest to Kennedy for the Warren Commission, one should wonder how Canning could project an 11 or 17 degree angle to the adjacent window.

That something is wrong becomes even clearer when one looks at Figure II-12 in Canning's final report. Despite the fact that Canning revised his estimation that the bullet had a flat trajectory through

the skull, realizing that a 5 degree descent through a skull pitched forward 11 degrees would project back 16 degrees to just above the sniper's nest, he failed to lift the rear projection of the trajectory the 5 degrees one would expect on Figure II-12. Inexplicably, he lifted it just one degree from 17 to 18. The close-up trajectory of 13 ½ degrees through the head stayed the same. Since neither the 17 degrees in F-139 nor the 18 degrees in II-12 are mentioned in Canning's testimony or report, it seems probable these were just mistakes related to his using drawings not properly made to scale. That these were not made to scale can be demonstrated by comparing the official measurements of the headshot from the sniper's nest—265 feet through the air from a 60 foot elevation (for a ratio of 4.4 to 1), with the drawing in F-139, which has a distance to elevation ratio of only 3.7 to 1, even though the trajectory led back within a few yards of the sniper's nest. Disturbingly, when asked in his testimony if the diagram was made to scale, Canning said "yes". While I hesitate to accuse the man of deliberate mischief, that he changed the backwards trajectory from Kennedy's wounds from 11 degrees in his testimony to 16 degrees in his report and had the point at which this trajectory hit the face of the school book depository change by only 10 feet or so in the exhibits he submitted to the committee, smells like a dead rat left inside a gym locker over summer vacation. The 5 degree increase in slope should have raised this location by nearly 30 feet.

When one looks at the HSCA Final Assassinations Report published by Bantam Books, one finds additional cause for concern. In this report, which, prior to the internet, was the only work by the HSCA widely available to the public, exhibits F-122 and 139 were re-printed, even though Canning had since modified the trajectories on display. (F-122 was a photo of school book depository with overlapping trajectory circles.) Presumably, no one noticed that Canning had updated his trajectories. Or maybe someone, like the parade of fans stalking Woody Allen in his film *Stardust Memories*, just liked the early ones better.

Shrunk Head Analysis

LOCATION OF HEAD WOUNDS IN PRESIDENT KENNEDY

Skulls at right are sized by Canning's 11 cm measurement.

LOCATION OF HEAD WOUNDS IN PRESIDENT KENNEDY

JFK EXHIBIT F-137

LOCATION OF HEAD WOUNDS IN PRESIDENT KENNEDY

FIGURE II-8

At left and right: HSCA Figures II-7 and II-6, from the HSCA trajectory analysis, March, 1979

Canning has shrunk Kennedy's skull by almost 7 per cent!

Shrunk Head Analysis

When Thomas Canning testified before the HSCA on September 12, 1978, he presented them with HSCA Exhibit F-137, and told them "The diagram on the left is actually generated from a tracing of a pre-mortem x-ray that had been taken of the President's head, so that one is a true scale representation of the President's skull." Six months later, when he submitted his final report, he presented them with a nearly identical diagram. Either this second diagram is a complete sham or Canning lied in his testimony.

As already mentioned, in F-137, Canning depicted a flat trajectory through the skull. Since Dr. Michael Baden had presented F-58, with a slight trajectory through the skull, to the committee only days before, it is embarrassing but not suspicious that Canning might present his exhibits as planned, and then make a few changes in his final report. A footnote on page 35 of the HSCA trajectory analysis addresses this issue: "The interpretation of the head wounds used in defining trajectory reported in testimony on September 12, 1978 differs from this report because the final illustration from the Forensic Pathology Panel showed the exit wound to be 1 centimeter lower than the entrance, rather than level with it as had been concluded earlier. Thus, the resulting trajectory is somewhat steeper." Fair enough. The problem is with the other footnote on that page: "The above conclusions differ to some extent from the testimony given by Thomas N. Canning... In *each case*, the differences reflect new information or analysis resulting from work concluded subsequent to the presentation of preliminary findings at the hearing." Well, as Dr. Michael Baden submitted F-58, depicting a slight descent within Kennedy's skull, 5 days *before* Canning testified, this footnote would appear to be a lie.

But it gets worse. Since the pathology panel determined that the bullet descended 1cm in Kennedy's skull, and since they decided it exited on the coronal suture connecting the frontal and parietal bones,

this meant the bullet would have to have been heading on a greater left to right trajectory through the skull. As the coronal suture, viewed from the front, runs at roughly a 55 degree angle in this stretch, an exit 1 cm lower and on the suture would also be an exit slightly more forward and approximately 8 mm further to the right on the skull. This meant that Canning would have to recalculate both his vertical and horizontal trajectories. The 5 degree greater decline in Kennedy should have made Canning lift his trajectory circle pointing back to the school book depository by 20 feet or more. He lifted it far less. It should also have led him to move the circle considerably to the east. If we take a 4 degree increase in left to right angle and project it backwards onto the face of the school book depository, which is at a 45 degree angle to the trajectory, we find the movement is magnified to 6 degrees, approximately 24 feet. The trajectory circle in F-137, however, would appear to be less than that distance from the east side of the school book depository. Therefore, this mere 1 cm movement of this exit wound should have forced Canning to move the center of his trajectory circle across the street to the top floor of the Dal-Tex Building, roughly three windows north of Elm and Houston. Instead, well, he found a way to keep the bullet on its former trajectory, but still have it exit further to the right on Kennedy's skull.

He shrank Kennedy's skull! On II-6 the length of the bullet's passage through the skull is identical to F-137, even though it exits further forward on the skull. A comparison of F-137 and II-6 in which the 11 cm passage through the skull is made to match demonstrates that the skull in II-6 is indeed 6.67% smaller. What's worse, since the distance from the EOP to the in-shoot supposedly remained 9 cm, this would indicate Kennedy's skull was not only shrunk, it was crushed, as the reduction in size occurred laterally.

But Figure II-7 wasn't any better. In order to maintain that the bullet traveled the same distance through a 6% smaller skull and still exited on the coronal suture, Canning moved the suture forward on the skull. So much for preserving the "true scale representation of the President's skull" ...

The Ten Degrees of Misinformation

HSCA Exhibit F-58 from the testimony of Dr. Michael Baden, representing the findings of the Forensic Pathology Panel

Drawing by Dr. Lawrence Angel,
Taken from Addendum E of the HSCA
Forensic Pathology Panel Report

Figure II-6 from the final report of trajectory analyst Thomas Canning, rotated 10 degrees.

HSCA Exhibit F-297, Kennedy's pre-mortem x-ray, rotated 10 degrees.

Blue arrows represent the trajectory in F-58.

The Ten Degrees of Misinformation

After noting that both F-66, the Ida Dox Drawing depicting the bullet trajectory through the skull, and F-137, the trajectory analysis depiction of this same passage, were pitched forward 10 degrees when compared to the other exhibits, I was at a loss. After all, both the HSCA's exhibit F-58, and the drawing of Dr. Lawrence Angel, a renowned expert on the human skull, presented the skull in a basically upright manner, with the bump at the back of the head (the EOP) in line with the end of the nose. Both of these exhibits appeared anatomically correct, in line with other depictions of skulls online and in anatomy books. So why are exhibits F-66 and F-137 not in line with these drawings? While I was immediately suspicious, I was unable to determine how and why such a mistake could be made. After all, by depicting a 10 degree greater descent through Kennedy's skull it would force Canning to project Kennedy's wounds up onto the roof or above, a fate that was only avoided through Canning's bizarre interpretation of frame Z-312..

Upon re-reading the testimony of both Canning and Ms. Dox, however, I found an answer to the first part of my question—the how. It seems President Kennedy's lateral x-rays were used in the creation of both F-66 and F-137. Upon close inspection, furthermore, I discovered that the skull in these x-rays was already pitched forward ten degrees (or more). Larry Sturdivan, in an online review of the autopsy materials created after his 2004 trip to the archives, said that his measurements of the President's teeth in the un-cropped postmortem x-ray indicated that “the head is tilted forward about 5 degrees in the published lateral view.” So I'm not alone in my assertion that the lateral isn't upright.

Ironically, this led me to be more suspicious about the second part of the question—the why. When one looks at the pre-mortem x-ray, which was entered into evidence as Exhibit F-297, one can't help but notice the crop. For some reason, the face and jaw have been removed. This was supposedly done for the Kennedy family's privacy. Since Kennedy's face is viewable on the A-P x-rays, however, and

these were entered into evidence, this makes little sense. What's more, since the x-rays of Kennedy's jaw and teeth were used to confirm the authenticity of the x-rays, and were released as public exhibits during the testimony of Dr. Lowell Levine, the decision to crop the x-rays is indeed curious. Could the x-rays have been cropped in order to confuse those most likely to study them, the conspiracy "buffs" so despised by the "experts"?

Perhaps. As I said at the introduction to this review of the evidence, I discovered more mistakes related to incompetence than to anything sinister. It turns out that the proper positioning of a skull in a lateral x-ray has little correlation to the anatomically correct position used by illustrators in anatomy books. According to Medical Radiographic Technic, an x-ray machine guidebook put out by General Electric in 1943, the central ray of a lateral x-ray is centered on the mid-point between the frontal bone and occipital protuberance, and the interorbital line (an imaginary line connecting the eye sockets) is made vertical. In other words, the head is situated to get as pure a profile shot as possible. NOTHING is said about framing the x-ray so that the skull on the film appears in an anatomically upright position. It could very well be then that Canning and Dox assumed this was done and created their exhibits under an incorrect assumption. And we all know what happens when we assume things...

Calibration Photo/ Z-312 Comparison

FIGURE II-B.—Calibration photograph corresponding with Zapruder frame 312.

Calibration Photo/Z312 Comparison

When one looks at the calibration photo prepared for Thomas Canning to demonstrate the President's actual position at frame 312, one can sense how desperate Canning was to find a position for the President's skull where a trajectory would point back to the school book depository.

On the calibration photo, most noticeably, the President's right shoulder is lifted far off the back seat of

the limo, resulting in a turn of his whole body sharply to its left. That this 27 degree turn makes it possible for a bullet traveling 8 degrees right to left to enter near the mid-line of the President's skull and exit from the right side of his head at the location picked by the pathology panel would have to be taken as more than a coincidence. That this turn is greatly exaggerated can be demonstrated by simply projecting Mrs. Kennedy into the calibration photo. When one creates a comparison where the heads are the same size one can see that while the President in Z-312 is looking just to the right of the first lady, the President in the calibration photo is looking just to the left.

An interesting point about this photo. On one of the footnotes in his report, Canning defends the changes from his testimony by re-stating his probably false claim that the doctors moved the wounds on him after his testimony. He goes on to say "The remaining revisions resulted from the availability of a superior enhanced reproduction of Zapruder frame 312 for comparison with the calibration photographs." This undoubtedly indicates he changed his interpretation of the calibration photo between his testimony and his report. The numbers given in each instance, however, were exactly the same: In both cases, Canning asserted that Kennedy was turned 25 degrees from Zapruder, was tilted 11 degrees forward, and was leaning 15 degrees to his left. This footnote makes me wonder if someone has changed Canning's testimony. If Canning originally said the calibration photo demonstrated Kennedy to be leaning forward 15 degrees, for instance, this might explain both the strange footnote cited above and the failure of F-139 to match the 11 degree descent implied in Canning's testimony. In any event, Canning's interpretation of Zapruder frame 312 is clearly, and incredibly, wrong...

Dale Myers is another writer/researcher who rejects the accuracy of this calibration photo. While creating his computer simulation/cartoon he ignored Canning and developed his own interpretation of the President's position at Z-312. When he projected backwards from the HSCA outshoot back through the in-shoot in the cowlick, however, Myers found that the trajectory led back to someone hanging in space, well above the Dal-Tex Building. He determined from this that there was no clear outshoot and acknowledges on his website that his depiction of the head-shot is not based upon a precise alignment of the wounds. ABC, of course, failed to point this out in their Beyond Conspiracy special presenting Myers' work.

And, incredibly, they weren't the first to play this game with Myers' animation... In 1998, Gus Russo, author of *Live By the Sword*, made similar use of Myers' animation, and, was even less honest re Myers' conclusions about the head wound trajectory. Despite the fact that Myers claimed the head wound trajectory could not be accurately identified, and pointed high up in the air, Russo not only cited the HSCA study--which Myers acknowledges is bogus--as evidence the head shot was fired from the sniper's nest, he told his readers that "Myers' work is conclusive that the wounds track back to the sixth floor window..."

What a load of crap!

But I digress.

A Nose is a Nose Analysis

Z-268: Kennedy's nose is easily discernible.

Z-284: less than one second after 268.
Kennedy's nose is still there.

Z-304: barely one second after 284.
Kennedy's nose is still there.

Z-312: less than a half second after 304.
Is that still his nose or what?

A Nose is a Nose Analysis

When Congressman Christopher Dodd pointed out to Canning during his testimony that the calibration photo depicted Kennedy turned far more sharply to his left than in Z-312, Canning delivered a surprising response: "I can assure you the images play games with you...For instance, the dark lapel of Mrs. Kennedy's blue blouse has a notch which is in close juxtaposition with the President's nose. The notch makes it look as if the President's nose extends much further than it really does...On the other hand, when we account for where other pink and blue elements are and behind the President's face we conclude that his facial profile is well to the left of its apparent position when only a cursory examination is the basis."

According to the book *Mortal Error*, Canning said much the same thing to ballistics expert Howard Donahue when he contacted Canning and questioned his analysis.

When one looks at the whole Zapruder film, however, and keeps their eye on Kennedy's nose, one can see that Kennedy's nose is exactly where it is in Z-312 for many frames beforehand, and that it would be very hard to confuse his nose for Jackie's ever-moving clothing. From this it would seem obvious that Canning spent too much time staring at Z-312 and talked himself into believing he was looking at Jackie's clothing. Perhaps he realized that if it was Kennedy's nose he was looking at, then Kennedy wasn't turned far enough to his left to allow a bullet to enter his cowlick and exit his right forehead on a straight trajectory from the sniper's nest. Indeed, it seems Canning himself knew his interpretation of Z-312 would be controversial, for the last section of his report reads like a pre-planned alibi: "Serious impediments to accurate interpretation of the photograph (Z-312) were occasioned by the extremely complicated background to the President's face resulting from Mrs. Kennedy's pink suit and dark blue blouse and by the interior surface of the left side of the limousine. These problems were overcome in part by a computer-enhanced version of Zapruder frame 312."

While it's tempting to say that if Canning really believed the nose in Z-312 was Jackie's blouse, then he must have swallowed the Kool-Aid, I will refrain from such a cheap shot. Due to his NASA background, one might logically assume that instead Canning swallowed some TANG.

Mary Moorman Photograph Analysis

Above: Zapruder frame 315 showing Mary Moorman at far left of frame, taking her photograph.

If Kennedy's head was turned 26.6 degrees to his left at 313, how come Moorman couldn't see his face?

At left: HSCA Exhibit F-138, the trajectory analysis of the shot at 313 (arrows added)

X marks the estimated position of Moorman relative to the limo at 315.

Direction of Kennedy's gaze as per HSCA trajectory analysis.

Proposed actual angle

At right: Mary Moorman photograph taken between Z-315 and Z-316

Mary Moorman Photograph Analysis

When one looks at the Polaroid photograph taken by eyewitness Mary Moorman just after the headshot one finds further reason to disbelieve the HSCA's trajectory analysis. While Moorman's photo clearly reveals the *back* of Kennedy's head, the HSCA's analysis is clear that her photo should have shown the *side* of Kennedy's head.

The HSCA exhibits show that they concluded the limousine was turned 8 degrees to the right of a straight line coming from the sniper's nest at the time of the fatal headshot. The calibration photo reflects that Kennedy was turned roughly 27 degrees to his left. From this the HSCA could conclude that a bullet fired from the sniper's nest and entering near the middle of the back of Kennedy's head and exiting near his temple would be traveling roughly 19 degrees to his right. Canning's trajectory analysis backed this up, stating that the left to right angle across Kennedy's skull connecting his wounds was 18.6 degrees. All the ducks seemed to be in a row. But what if the bullet didn't travel in a straight line? Since accepting this possibility would leave the door open for conjecture that the fatal head shot came from somewhere other than the TSBD, that would have been troublesome for the HSCA.

And what if it can be demonstrated that Kennedy was not turned 26.6 degrees to his left?

Since Mary Moorman's photograph shows Kennedy in line with the back tire of the limo and the stairs on the grassy knoll, one can fairly accurately place both her position on the grass and the timing of her photograph. Consequently, most have her taking her photograph between Z-315 and Z-316. Ironically, she can be seen in the Zapruder film snapping her photograph in the far left area of the sprocket holes in frame Z-315. The limousine has scarcely passed her. Since the limousine was heading away from Moorman at 40 degrees left of her view, and since Kennedy was supposedly turned 27 degrees from the direction of the limousine, this means that in Canning's analysis, Kennedy should have been only 23 degrees removed from profile to Moorman. As you can't even see his face in the photograph, it would appear he wasn't really turned that far.

But what if he'd changed his head position between 312 and 315?

More Moorman Photo Analysis

Mary Moorman photograph taken between Z-315 and Z-316. Is Kennedy turned further away from Moorman in this photo or from Zapruder in the frames at right?

Zapruder Frame 312

Perspectives of Moorman (green arrows) and Zapruder (pink arrows) as per the HSCA trajectory analysis, on left, and our new perspective, on right. Blue arrows mark the relative positions of the ear.

Zapruder Frame 315: relative position of ear (just behind the splayed open part of the skull) to the back of the head appears to be the same as at Z-312. Thus there was no rapid turn to the left as purported by the "jet effect" theory.

More Moorman Photo Analysis

To be sure the angle of Kennedy's head hadn't changed between Z-312 and Z-315, one need only to look at the photos side by side and note the position of his ear. A turn to the left or the right would change the position of his ear relative to the rest of his head. As there appears to be little change, one can assume his head did not turn upon immediate impact of the bullet.

This pretty much demolishes the so-called "jet effect" theory, as proposed by Nobel prize-winning physicist Luis Alvarez. The "jet effect" holds that the force of brain matter exploding from Kennedy's pressurized skull was significant enough to fling his whole body backwards, as seen in the frames

following Z-313. Well, if the “jet effect” from matter exploding from the right temple of Kennedy’s head was strong enough to push his body it should also have been strong enough to turn his head. If you turn your head slightly to your left and apply the slightest pressure to your right temple area it will turn your head further to the left. And yet there is little change in Kennedy’s position between Z-312 and Z-315. Even worse, for Alvarez’ theory, the Moorman photos show Kennedy’s head is turned too far to its *right*, when compared to the HSCA’s trajectories. If there really was a “jet effect” it would mean then that Kennedy had started out looking nearly straight ahead, but if he’d been looking straight ahead, a bullet entering near the midline of his skull on an 8 degree right to left trajectory would have exited out near his *left eye*, and not his right temple. If anyone knows of any reason why the “jet effect” would fail to move the skull until after all the ejected brain matter was long gone, I’d appreciate the explanation.

When one turns a skull 23 degrees from profile, the perspective of Moorman on Kennedy should he really have had his head turned 27 degrees to the left within the limousine at Z-312, one can see that the skull is not far from profile, with the ear almost in the middle and the left side of the face visible. When one turns the skull the degree I theorize Kennedy was actually turned, 36 degrees, the ear moves closer to the face and more of the right side of the head becomes visible. When one realizes none of Kennedy’s face is visible in the Moorman photo, due at least in part to Kennedy’s hair being draped to his left, it becomes clear that this new perspective makes a lot more visual sense than Canning’s trajectory analysis. A quick measurement of the relative positions of the ear within the two theories is convincing, assuming the anatomic models used are similar to Kennedy. While Zapruder frame 312, after the frame is rotated 30 degrees so that his skull is made upright, depicts the back of Kennedy’s ear at roughly 50% the horizontal distance between the tip of his nose and the far back of his head, and our new perspective is in close agreement, the Canning perspective depicts the ear at only 39% of the distance. The head is turned too far to the left.

If one should continue to doubt that a NASA scientist could screw up to such a degree, one should sit back and consider that by deciding Kennedy’s head was turned 27 degrees to his left, Canning also decided that Kennedy was more in profile to Moorman, to the extent that Kennedy was turned only 23 degrees from her at the time of her photograph. Since, as part of this same analysis the HSCA determined Kennedy was turned from Abraham Zapruder by approximately 25 degrees at frame 312, this means the HSCA determined that Kennedy was turned further away from Zapruder at frame 312, where he’s almost in profile, than he was from Moorman at the time of her photograph, which doesn’t even show his face! When one considers that the limousine was still heading towards Zapruder at 312, and reached exact profile around 315, this means that Kennedy was turned an additional two degrees away from Zapruder at 315, or 27 degrees. And yet Kennedy’s horribly-damaged head in the Zapruder film at 315 is still obviously more in profile than in the Moorman photo, even though it should be turned 4 degrees further away!

By now, it should be clear that virtually every exhibit created for the trajectory analysis was misleading, and most all the conclusions in Thomas Canning’s report false. This leads one to ask “But how could this have happened? If the HSCA had hired Canning in order to move things around and make a case for Oswald as a lone assassin, why did the Committee turn around and find a conspiracy was likely? The answer is I’m not sure. Researcher Jim Di Eugenio reveals in his article *The Sins of Robert Blakey* that somewhere in his investigation Canning stopped listening to Dr. Baden, the head of the forensic pathology panel, and started a back-door channel to two of its more conservative panelists, Dr. Loquvam, who was quite demonstrative in his urging that all disputes between panelists be kept off the record, and Dr. Weston, who’d already confirmed Oswald’s sole guilt on a 1975 CBS special. Canning’s frustration with Baden and in general is confirmed by his January 1979 letter to chief counsel Robert Blakey. In this letter, Canning complained of the adversarial staff lawyers and the

difficulty of getting “quantitative data—and even consistent descriptions—from the forensic pathologists.” That Canning was not diabolical, but simply sloppy, seems to be confirmed by this letter, as Canning recorded the date as 1978 when it was in fact 1979.

Further understanding of Canning’s errors comes from studying his testimony. First of all, Blakey introduced Canning by telling the audience that “the trajectory analysis itself was a joint effort between the committee and the National Aeronautics and Space Administration. An engineer with NASA Space Project Division, Tom Canning, constructed the final product from information provided by the committee from its various panels.” Hmm, so the man has no experience with wound ballistics but has nevertheless been tasked by a government agency dependent on congress for survival with creating “product,” based on information given to him by the committee. Doesn’t exactly sound like an independent search for truth, now does it? Canning’s own words tell the rest of the story: When asked by Congressman (now Senator) Dodd, about the small size of his trajectory circles (the area from which a shot was most likely fired--derived through rear-projection of a path between two known wound locations), Canning admitted his circles were much smaller than would normally be created by a forensic pathologist, whom he described as overly “conservative.” This indicates that Canning felt he had a new bold approach whereby he could accurately pinpoint the location of a shooter to a far greater degree than any of his more-experienced colleagues. One wonders then if this “boldness” was a factor in Canning’s employment, if not a prerequisite, since it clearly was not his experience. Just as troubling as Canning’s over-playing his hand is that Dodd’s request for more “conservative” exhibits, which included the areas of the Dal-Tex Building which fell within the trajectory circles, went unheeded. The final report was printed and distributed using Canning’s admittedly bold exhibits, without any conservative or thorough exhibits for balance.

An overall view of the HSCA may also be enlightening. While the HSCA eventually found for a conspiracy, this was based on last-minute testimony that a recording of the assassination revealed more shots than Oswald could have fired alone, and a subsequent confirmation of this testimony from a separate group of experts. This means that until the last minute, as late as December, 1978, three months after the public hearings, the HSCA was heading towards the conclusion that Oswald acted alone. Is it any wonder then that the medical exhibits and trajectory exhibits, most prepared for testimony many months before the final report, were so bold in their attempts to show there was only one shooter? The men who prepared these exhibits had reason to believe that this was what the HSCA was looking for: convincing proof that Oswald acted alone. No one wanted another investigation.

The Forgotten Angle

Above: HSCA Exhibits F-147 and Figure II-7, rotated 25 degrees to recreate Kennedy's leftward lean in Z-312. At right: a crop from the Moorman photo demonstrating the severity of the lean.

The Forgotten Angle

Should one still have trouble believing that the HSCA trajectory analysis, performed jointly with NASA, was a complete sham, one need only look at the Moorman photo and reflect on Kennedy's severe pitch to his left. While Canning's interpretation of the calibration photo acknowledged Kennedy was leaning 15 degrees to his left, a careful reading of Canning's report reveals that this 15 degrees was 15 degrees from Zapruder, and that Zapruder was elevated 10 degrees from Kennedy, standing on a flat pedestal. This indicates that Kennedy was actually leaning 25 degrees to his left when compared to true vertical. A few degrees of this might have been caused by the road surface, which appears to be slanted ever so slightly towards the middle of the plaza. (If someone has measured this, please let me know.) In any case, this 25 degree lean is supported by Kennedy's appearance in the Moorman photo. Ironically, it would appear to be one of the few correct measurements made by Canning. So why didn't he use it?

His avoidance of the ramifications of this measurement becomes clear when one looks back at the frontal views of the head wounds. Since Canning initially testified that the bullet headed left to right and that the entrance and exit of the bullet were on the same level, a 25 degree rotation to the left will lift the exit to a point above the entrance. Considerably above the entrance. A quick measurement using Canning's own diagram tells us that the exit in F-147, once adjusted for the leftward lean, was in fact 1.6 cm above the entrance. Based upon Canning's own calculations that a 1 cm drop within the skull represented a descent of 5 degrees, this meant that the bullet causing the wounds in F-147 in fact *ascended* 8 degrees within the skull. Since Canning's interpretation of the calibration photo held that Kennedy was only leaning forward 11 degrees, this meant that Canning, when taking into account the leftward lean, should have determined that Kennedy was killed by someone on the ground, somewhere behind him on Elm Street, as Elm Street descends 3 degrees throughout the Plaza.

Adding to the confusion is that this lean to the left decreases the left to right angle through Kennedy's head by a degree. If one were to trust Canning's calibration photo completely, this would indicate that someone on the north side of Elm Street back towards the school book depository fired the fatal shot.

When one looks at exhibit II-6 from Canning's final report, of course, things are slightly better. But only slightly. Here, the ascent in Kennedy's skull is only 3 degrees. Since Canning stuck by his determination that Kennedy was leaning forward but 11 degrees at Z-312, he should, if he would have bothered to take into account Kennedy's severe leftward lean, have also determined that the bullet killing Kennedy was descending 8 degrees, from the second or third floor of the school book depository. Since Oswald was seen on the second floor shortly after the shooting, Canning may have been able to make this one fly. He would have had a problem explaining how or why Oswald ran up to the sixth floor, hid his gun, and then raced back down to the floor of the shooting, however.

I'm being facetious, of course, but the HSCA trajectory analysis is so flawed it's simply ridiculous. Why anyone still defends it or claims it as support of their theories is beyond me.

Windshield Fragment Trajectory

One final reason to doubt the HSCA trajectories comes from a close inspection of the Warren Commission and HSCA exhibits depicting the fatal head shot. Significantly, they all place Kennedy near the middle of the limousine, directly contradicting the Zapruder film, which shows Kennedy,

sitting on the far right side of the limousine, slumped slightly to his left. It is Mrs. Kennedy that moves towards the President, and not the President who moves closer to Mrs. Kennedy.

This confused me until I began to wonder if this movement placed the exit wound more in line with the crack found on the windshield. Since the bullet fragment found in the seat directly below the crack was the nose of the bullet believed to have hit Kennedy in the skull, this only made sense.

This led me to wonder what would happen if one projected back from the windshield fragment itself, at the 8 degrees which would presumably lead back to the school book depository. This trajectory led back to the President's position several inches closer to the door than depicted by the HSCA, or as re-enacted by the FBI for the Warren Commission. So why had they moved him further to his left than necessary?

I then realized that this movement of Kennedy's body to its left by a foot or so along with Canning's excessive turn of Kennedy's head to its left allowed for the nose of the bullet to traverse the *right side* of the President's skull and continue on to hit the windshield, in a straight line. A proper placement of Kennedy in his seat, taking into account a slight slump to his left, however, reveals that the trajectory from the position of Kennedy's wound to the crack on the windshield was *greater than the 8 degrees of the bullet coming from the TSBD*. This means the bullet, if it had come from the TSBD, was slightly deflected to its *left* upon exit, which makes little sense if it had indeed traveled through the President's skull in a straight line, as Canning maintained.

Even worse, the bullet as tracked by Canning would leave Kennedy's skull still heading 16 degrees downwards, which makes no sense considering that the nose of the bullet ended up hitting the windshield at the same level or slightly higher than its supposed exit from Kennedy's skull. Not that this bothered Canning all that much. He told the HSCA: "I noted qualitatively that damage to the windshield of the car appeared to be in reasonable directional alignment but did not appear to be particularly in good slope alignment. But I did no quantitative work in that line."

Adding to the significance of this fragment's hitting the windshield is that there was a second bullet fragment, a portion of the copper jacket including the copper base, which landed in the front seat after striking a metal strip above the windshield. The discovery of this fragment is a problem for the official story for several reasons. The book *Medicolegal Investigation of Death*, by the Clark Panel's Dr. Russell Fisher and the HSCA's Dr. Werner Spitz, discussed the separation of a copper jacket from its lead core as follows: "Sometimes the jacket of a bullet separates from the core upon impact...In such cases the jacket and the core each assume separate paths. Whereas the core may leave the body, the jacket very seldom does." So, if a copper fragment "very seldom:" traverses a body, why should we conclude one traversed a skull heading downwards and then changed directions upon exit?

We shouldn't. Certainly there's a reasonable explanation out there for why the two largest bullet fragments ended up on the front seat of the limo...we just have to find it...

Brain Trajectory Analysis

Zapruder frame 312, depicting a 27 degree forward lean

Red stars and arrows represent the EOP entrance, exit, and trajectories (with the exit determined by the location of the beveled bone in Larry Sturdivan's interpretation of the 'mystery photo'). Blue stars and arrows represent the HSCA entrance, exit, and trajectories. Larger stars represent the locations of the exits on the far side of the head.

Cross-section of skull revealing brain in situ, rotated 27 degrees to match Z-312

Above: HSCA Figure 32: a drawing of a photograph of the President's brain viewed from above. Black lines added for purposes of comparison

At left: HSCA Figure 24, rotated 25 degrees to reflect Kennedy's lean at Z-312.

At right: posterior view of a brain, rotated 25 degrees to reflect Kennedy's lean to the left at Z-312.

Brain Trajectory Analysis

When one compares the Warren Commission trajectory, the HSCA trajectory, and the damage to Kennedy's brain one finds another mystery to ponder. Neither trajectory makes much sense. While one of the reasons given by the HSCA pathology panel for accepting the Clark Panel's location for the entrance wound was that they determined by looking at the autopsy photos that "the posterior-inferior portion of the cerebellum" was "virtually intact...It certainly does not demonstrate the degree of laceration, fragmentation, or contusion (as appears subsequently on the superior aspect of the brain) that would be expected in this location if the bullet wound of entrance were as described in the autopsy report," the entrance in the cowlick makes even less sense. For one, a bullet entering the cowlick with the skull leaned as far forward as at Z-312 would have to traverse the brain just beneath the skull for a distance before exploding upwards; this seems unlikely, as the strong impact of a fragmenting bullet with the skull almost on edge would almost certainly guarantee a large "gutter" wound of both entrance and exit and rule out the small oval entrance identified in the autopsy photos. For two, a bullet entering the HSCA's entrance would enter the skull at a point further forward than 20% of the brain, and yet still somehow create a channel running just right of the mid-line of the brain for the length of the brain. For three strikes and out, even though a fragmenting bullet is reputed to leave a trail the shape of an ever-widening cone, the greatest damage apparent in the only released drawing of the brain appears to the left of the HSCA trajectory, with the largest section of intact brain directly in its path.

The Warren Commission trajectory is nearly as unworkable. A bullet entering just right of the EOP at frame 313 would almost certainly strike cerebellum, which was reportedly undamaged. While there were extensive lacerations of the brain, they were not reflective of the passage of a fragmenting bullet

from low on the occipital lobe to high on the frontal lobe. Outside of the three autopsy doctors, I'm unaware of any medical doctor looking at the photos of the brain and coming away from the archives convinced a bullet could have entered low and exited high.

The only WC or HSCA expert currently defending the low entrance is, ironically, the HSCA's Larry Sturdivan, who originally testified in support of the high entrance. In his book, *The JFK Myths*, he explains that fragmenting bullets will sail upwards and leave a curved trajectory. While this could very well be, he offers little in the way of explanation as to why the cerebellum remained intact. Even if one concedes the entrance could have been higher than the cerebellum, it still wouldn't explain why the area of the cerebellum closest to the entrance wasn't damaged, as there were areas significantly above the entrance that were destroyed. Sturdivan also acknowledges that a "Gutter wound extends from tip of occipital lobe to tip of frontal lobe," but fails to note that by his own study much of this bullet exited mid-trajectory. Similarly, Sturdivan's trajectory is tainted by his interpretation of the "mystery" photo, which suggests that a fragment exited Kennedy's forehead, where not one of the dozens who saw Kennedy's wounds reported an exit. If Sturdivan were to hold, as the HSCA, that this presumed exit was that of the nose of the bullet, moreover, he would have a difficult time explaining why this bullet, having entered near the EOP, traveled 5 degrees right to left (based on a 17 cm length for Kennedy's skull). This 5 degree right to left angle through the skull, when taken in conjunction with the fact Kennedy's skull was turned at least 14 degrees to his left at Z-312, along with the bullet's 3 degree or more ascent within the skull, would project back to a shooter lying on the ground 10-20 yards behind the President's right shoulder. Perhaps this is why Sturdivan refuses to identify the beveled bone as an exit. Instead, he leaves its identity a mystery and asserts that the nose of the bullet curved significantly upwards within the skull while traveling at better than 1,000 feet per second.

Surprisingly, there is some support for Sturdivan's current belief that the beveled piece of bone in the foreground of the mystery photo, while appearing to reflect the passage of a bullet, does no such thing. During the 1992 ABA mock trial of Oswald, Dr. Roger McCarthy, who'd been conducting test firings on human skulls in anticipation of his appearance, testified: "Skulls are very inhomogeneous--by that I mean they've got different layers and they've got different form and they are not a homogeneous material that is all the same, that always responds to the same impact. In fact, some of the skulls we shot--and this is another one that I shot--actually developed a beveled wound, with a knockout, and it wasn't anywhere near the bullet."

The Canal Canal

Above: this comparison of medical illustrations demonstrates that the large brain laceration described at the autopsy begins much too high to have begun at the EOP or Humes entrance. While the red line above, representing the line of damage through the brain is approximately 6.5 cm below the vertex of the skull and more than 4.5 cm below the vertex of the brain, it is still inches above the EOP entrance.

The Canal Canal

In August 2006, while browsing the many online forums relating to the assassination, I was surprised to find that John Canal, an ardent proponent of the low skull entrance measured at the autopsy, was citing the damage to Kennedy's brain as evidence for this low entrance. This was surprising because the HSCA medical panel listed the lack of damage to Kennedy's brain nearest this entrance as a reason to believe the actual entrance was four inches higher. I re-read the autopsy report to see if Canal had any basis for his statements.

The supplementary autopsy report signed by Dr. Humes on December 6, 1963 reports the damage to Kennedy's brain as follows: "Following formalin fixation the brain weighs 1500 gms. The right cerebral hemisphere is found to be markedly disrupted. There is a longitudinal laceration of the right hemisphere which is para-sagittal in position *approximately 2.5 cm. to the right of the midline* which extends from the tip of the occipital lobe posteriorly to the tip of the frontal lobe anteriorly. The base of the laceration is situated approximately 4.5 cm. below the vertex in the white matter. There is considerable loss of cortical substance above the base of the laceration, particularly in the parietal lobe. The margins of this laceration are at all points jagged and irregular, with additional lacerations extending in varying directions and for varying distances from the main laceration."

Sure enough, by claiming that the laceration began 2.5 cm to the right of the mid-line, the same distance as the bullet entrance on the skull, the supplementary report supported that the brain damage came from the bullet creating this low entrance.

I was still not convinced this laceration lined up with the skull entrance, however. I looked up the word

“longitudinal.” “Longitudinal: The word comes from the Latin *longitudo* meaning length. Hence, longitudinal means along the length, running lengthwise.” Since the brain is longer from back to front than it is tall, the back to front direction is “longitudinal.” This interpretation is confirmed by the doctors' use of the word “para-sagittal,” which means running parallel to the sagittal suture, the suture running from back to front along the middle of the top of the skull. The doctors' use of these terms implies that the bullet track ran straight across the brain. This is made even clearer when one realizes Humes only gave one measurement for the distance of the laceration below the vertex, the top of the brain within the skull. This 4.5 cm measurement is, of course, far too small to suggest that a bullet entered near the hairline and traveled upwards within the brain. Consequently, the only possible explanation I could come up with that would make the brain damage described by Humes compatible with the low bullet entrance is that Humes and Boswell, career pathologists, became confused as to the location of the vertex, and incorrectly assumed the far back part of the parietal lobe was the vertex. But this is not supported by the subsequent statements of the Clark and HSCA Forensic Pathology panels...

Here is what they had to say... The Clark Panel: “The right cerebral hemisphere is extensively lacerated. It is transected by a broad *canal* running generally in a posterior-anterior direction and to the right of the midline. Much of the roof of this canal is missing as are most of the overlying frontal and parietal gyri. In the central portion of its base can be seen a gray brown rectangular structure measuring approximately 13 x 20 mm. Its identity can not be established by the Panel”. The HSCA Forensic Pathology Panel: “On the right cerebral hemisphere is an anterior posterior cylindrical groove in which the brain substance is fragmented or absent. This groove extends from the back of the brain to the right frontal area of the brain and contains within the depths of its central portion a grey brown rectangular area. The majority of the panel considers this to be a blood vessel in the Sylvian fissure.”

As neither panel noted a laceration rising from low on the occipital lobe to the middle of the frontal lobe, the Warren Commission's trajectory must be rejected. Unless one is to believe, as Canal, that the subsequent panels lied to conceal damage to the brain supporting that Oswald acted alone, one should conclude that Dr. Humes' 2.5 cm from the mid-line measurement of the brain laceration (what I stupidly refer to as the Canal Canal) was just a coincidence, or more probably, the result of his stretching things a little to try and make the evidence add up.

In the following chapters, I will follow his lead and try to make the evidence add up. Hopefully, it won't be too much of a stretch.

Chapter 16: New Views on the Same Scene

A look at the various efforts to simulate and explain the President's head wounds, and a discussion of why they fall short

Reading the Test Skulls

Above: Warren Commission Exhibit 861, one of the ten test skulls fired on for the Warren Commission.

At right: a test skull fired on by Dr. John Lattimer, from his 1980 book Kennedy and Lincoln.

At right: three more of the test skulls fired on for the Warren Commission, from the March, 1965 report of Dr. Alfred Olivier.

4-49478

4-49513

4-49562

Note that Lattimer's test skull, with a cowlick entrance, blew out on the left side, while the Warren Commission's test skulls, with a lower entrance, did not.

For reasons beyond my grasp, the first image in each chapter sometimes fails to appear. If there's nothing up above, don't despair; you can still see the image [here](#)

Reading the Test Skulls

In order to determine if the rifle found in the school book depository was capable of creating President Kennedy's wounds, Dr. Alfred Olivier of Edgewood Arsenal was hired by the Warren Commission to perform a series of tests. He testified before the Commission on May 6, 1964. In his testimony, Olivier admitted he was surprised by the damage created by the 6.5 mm ammunition, and introduced a photograph of a skull as Exhibit 861. This was what was left of a gelatin-filled skull after it had been fired upon by a rifle like the one purportedly belonging to Oswald. Olivier noted that the bullet hitting this skull broke into pieces and that these pieces resembled the bullet fragments recovered from Kennedy's limousine. He also acknowledged that the bullet striking this skull missed its mark and hit the back of the skull slightly closer to its side than the reported entrance on Kennedy.

There are reasons to doubt Kennedy's wounds were accurately replicated, however. Since, as subsequently acknowledged by Larry Sturdivan, who worked with Olivier, the shooters were trying to make the bullet follow the Warren Commission's proposed path, entering low in the occipital bone and exiting above the temple, we can only assume the skulls were turned slightly to the left of these

shooters. This, in turn, makes it reasonable to assume that the damage to the bullet and skull cited by Olivier came as a result of the bullet's striking the thick occipital bone almost on edge along the curvature behind the ear. (A bullet striking skull bone on edge meets more resistance and is more likely to explode). Even if the bullet's striking the skull 4 mm to the right of the supposed entrance and at a greater angle than if the bullet were coming from the sniper's nest was irrelevant, however, Sturdivan's admission that they were trying to re-create the wounds, as opposed to analyzing the position of Kennedy's skull in relation to the sniper's nest and shooting at the supposed entrance to see what happened, is telling. It indicates, as with so many of the other tests performed for the Warren Commission, that they were not testing to see if a shot from the sniper's nest would be likely to create the wounds described by the doctors, but were instead trying to create evidence demonstrating that it did. This was to no avail. In opposition to both the Warren Commission's determination that a bullet entering low on the back of the President's skull left a small round hole on the bone (when viewed from the inside), and the HSCA's determination that the bullet entering near the cowlick left a similarly small round hole on the bone, the bullet in Olivier's test shattered the entire right side of the skull, from entrance to exit.

When one studies Wound Ballistics of 6.5 mm Mannlicher-Carcano Ammunition, Olivier's report on his tests, issued in March 1965, one finds more reason to doubt that the tests proved what they were designed to prove. In figure A12 of the report the profiles of three additional skulls are revealed. While the damage is extensive in each one, there is no evidence that a bullet sailed upwards and blew out the top of a skull, the purported course of the bullet striking Kennedy. In fact, even though the skulls were aligned to make the bullet exit the top of the skull (as admitted by Sturdivan) all the shots blew out near the right eye socket. It is also intriguing that there is only one picture portraying the bullet's entrance on the bone in Olivier's report, and that this small entrance was directly in the middle of the occipital bone. Perhaps this is an indication that NOT ONE of the bullets striking an inch to the right of the EOP left anything similar to the small round entrance on the bone observed by the doctors at the autopsy. This might make one wonder if this entrance was even created by a Mannlicher-Carcano rifle. When one realizes that the 56 page report, which has 4 pages of cover sheets, 2 pages of temperature readings, and a 7 page distribution list, fails to list the ten test skulls with a break down by entrance location, entrance size, exit location, exit size, and whether or not the bullet broke-up--which was only the most important data obtained by Olivier's tests--one's suspicions should only grow. It should be noted here that when Dr. Olivier testified before the Warren Commission, he was asked by Arlen Specter the exact entrance location on the skull displayed in Exhibit 861, and that he'd consulted a notebook he'd brought along, which had been locked up in a safe. Why this data failed to make the report, which was classified Confidential and not released to the public until 1973, is a matter of conjecture. When one looks back on Olivier's testimony of May 6, 1964, and realizes that he testified accurately at that early date on the three tests described in the March 1965 report, and that no further tests were conducted, however, one should rightly suspect that his report was deliberately delayed and not given to the Warren Commission or released among its papers.

It seems likely from this that someone in the know knew Olivier's tests failed to support the shooting scenario pushed by the Warren Commission.

Howard Donahue, a ballistics expert, also had his doubts that Olivier's tests accurately replicated Kennedy's wounds. In August 1977, Donahue was interviewed on radio station WBAL. He told his interviewer that in the late sixties *"I went and visited the laboratories at Edgewood Arsenal and talked to Dr. Olivier himself. Now he had fired ten shots into ten inert skulls from Oswald's rifle. Now, an inert skull is a human skull which has been filled with gelatin. None of these skulls showed the giant, enormous, macerating effect that Kennedy's head showed. And then I began to look at the two holes in his head. And I realized it couldn't have come from Oswald's rifle. And then a strange pattern of events*

started to occur that everything that supported the Warren Commission was easily obtainable for evidence and that which contradicted it was not available.”

While the skull presented by Olivier in his Warren Commission testimony had had its right side blown off, Donahue concluded it was not as "macerated" as Kennedy's skull. This suggests that the skull fragments blasted from Olivier's test skulls were larger and more contiguous than the fragments blasted from Kennedy's skull, some of which were never found.

Single-assassin theorist extraordinaire Dr. John Lattimer conducted some skull tests of his own. In a February 1976 article in Surgery, Gynecology, and Obstetrics, and then again in his 1980 book Kennedy and Lincoln, he presented another test skull upon which Mannlicher-Carcano ammunition had shattered. Since Lattimer only presented a lateral photo of this skull, it's impossible to compare the size of the bullet's entrance to that measured at the autopsy. Still, as there appears to be some sort of wire holding the back of the skull together where the bullet is presumed to have entered (Lattimer was aiming for the cowlick entrance), it appears this skull exploded, much as Olivier's Exhibit 861. There was certainly no small entrance in the back of the head leading to a huge gaping defect in the front.

The suspicion that this skull showed one massive wound, and that Dr. Lattimer had wired the back of the skull together for this photo, moreover, was later proven correct by...Dr. Lattimer. During his appearance at the '93 Chicago conference on the medical evidence Dr. Lattimer presented a second photo of this skull. This photo showed that the skull wound actually started at the back of the head, near the cowlick entrance, and stretched all the way to the forehead. Despite Lattimer's assertions that the damage to this skull was similar to Kennedy's, and that it confirmed the Clark Panel's interpretation of the head wound, both the photo he'd used previously and the second photo of this skull showed that the left side of this test skull was blown out nearly as badly as its right. Conversely, the fragments of the assassin's bullet, despite supposedly entering Kennedy's skull less than an inch from its mid-line, were not believed to have crossed the mid-line of his brain.

Shooting Skulls off Ladders

Across the top and at left: four frames from one of Dr. Lattimer's simulations purported to recreate the "back-and-to-the-left" motion of Kennedy's skull. Note that the forward momentum of the bullet is transferred into the ladder, and the skull bounces backwards from the recoil.

At right: another one of Lattimer's tests, from the website of John McAdams. Note that the impact location is near the center of the explosion.

Above: Zapruder frame 313. Kennedy's skull has moved several inches forward from the moment of impact. Why is there no cloud of debris enveloping the back of his head?

Shooting Skulls off Ladders

And yet Lattimer fails to note this problem in his article. Instead, he boasts *"In each instance in which a bullet struck one of our skulls in a slightly tangential manner, as with the skull wound of President Kennedy, the bullet apparently deformed enough to cause a larger wound of exit and a large soft-tissue cavity inside the confined brain case with tremendous pressure, which then expanded after the bullet had left and blew the calvarium into several fragments, many of which went upward and forward for distances as great as 20 to 30 feet, as in frame 313 of the Zapruder movie."*

Well, hold it right there... "as great as 20 to 30 feet?" The fragment exploding upward in frame 313 was almost certainly the Harper fragment, which was found on the grass roughly 80 feet from the impact location. An 11-19-75 letter from Lattimer to Emory Brown (found in the Weisberg Archives), far worse, reveals that Lattimer knew the lack of scalp on his test skulls increased the magnitude of the "blast" in his test firings by as much as a factor of 4. So where does he get off pretending his simulations came anywhere near replicating the explosion of bone shown on frame 313? And why does he repeat in his summary that in his tests fragments of bone *"flew 20 to 30 feet upward out of the skull, as with President Kennedy."* Was he afraid to acknowledge any inconsistency?

Apparently so. The only inconsistency acknowledged in the article is one he blames on others. In his article, he reports: *"There was a discrepancy between the drawings in the Warren Commission Report, which indicated relatively minor skull wounds, and our knowledge from our wartime and research experience that much more severe wounds were to be expected from this type of military rifle bullet. It was this discrepancy which had led to our initial skepticism about the accuracy of the Warren Commission Report, as reflected by the illustrations of the President's wounds."*

Well, this is a bit bizarre. Lattimer reported no such discrepancy between the drawings of the head

wound and the autopsy photos after visiting the archives in 1972. Even stranger, in interviews conducted after his visit, he'd intimated that it was the drawings of the single-bullet trajectory that had previously given him so much concern. As the autopsy photographs prove that Kennedy's large head wound, as initially observed, DID resemble the wound in the Commission's drawings in the Warren Report, moreover, it seems possible Lattimer was simply blowing smoke. The skulls on which he fired, with no restrictive scalp, exploded to a far greater extent than the autopsy photos prove Kennedy's skull exploded, and rather than admit this, he sidestepped the issue by claiming the drawings created for the Warren Commission were inaccurate. Methinks the man a weasel.

An article in the November 1998 edition of the Dealey Plaza Echo provides more background on Lattimer and his skull tests. When asked by British researcher Russell Kent why he didn't shoot his skulls from elevation in order to replicate the supposed trajectory in Dealey Plaza, Lattimer replied "*He was leaning forward a bit.*" So much for his concern for accuracy. Lattimer also claimed "*We did know the exact location of the wound of entrance. The prosecutors did not have the time to study the X-rays the way we did. Why do you say that the face is blown off? The forehead was blown off, not the face. The bulk of the skull jumped back at the gun; the other fragments were smaller.*" When asked about the damage to a particular skull he'd claimed was a "Duplication of Kennedy's Head Wound" Lattimer responded "*I was distinguishing our skull wounds with those of Dr. Olivier where the right side of the face was removed when the "lower" impact point was used.*"

From this it's clear that Lattimer believed Olivier's use of the "lower" impact point was the cause of his failure to exactly replicate Kennedy's wounds. Since Lattimer also claimed he knew "*the exact location of the wound of entrance,*" one might rightly assume that Lattimer went to his grave convinced that the higher entrance in the cowlick first proposed by the Clark Panel was the authentic entrance location on Kennedy's skull. But one would be wrong. On August 14, 2006, researcher/writer John Canal, who is convinced that the autopsists were correct about the "low" entrance wound, informed this writer that Lattimer had officially changed his opinion about the entrance. Canal posted two e-mails from Lattimer on the alt.assassination.JFK newsgroup. These reflected that Lattimer had indeed changed his opinion. On March 24, 2004, Lattimer wrote Canal: "*It does seem to me that you and your colleagues have made great progress in investigating these points, and the curved track in the brain is not only reasonable but is probably demonstrable.*" On April 27, 2004, Lattimer wrote Canal: "*I do not think that the correction about the exact point of entry into Kennedy's head would merit any action from a government official, but (we) would benefit from an article correcting the whole matter, which you could refer to in the literature.*"

The man who once claimed he'd "duplicated" Kennedy's head wound while firing at the "high" entrance location had thereby acknowledged his tests were irrelevant, as he'd been firing at the wrong entrance location.

When one actually watches Lattimer's skull tests, however, one should conclude that they are anything but irrelevant. They are, in fact, strong evidence that the shooting did not occur as purported. For one, the clouds of debris exploding from the skulls in Lattimer's tests inevitably obscure the entire skull. The explosion of blood apparent in the Zapruder film, on the other hand, appears exclusively on the front half of the skull. Researcher Sherry Gutierrez, a professional blood-spatter analyst, has written about this issue extensively. On August 18, 2006, in an online post, she told the Education Forum: "*The velocity and volume of the blood leaving the impact site as back spatter has much less velocity than blood leaving exit wounds as forward spatter; and the back spatter droplets only travel about 3-4 feet from the source...Back spatter does not travel more than 3 or 4 feet and is often described as a multitude of minuscule blood droplets that resemble an atomized spray or mist.*" As back spatter moves slower than forward spatter, and stays closer to the impact location, one should wonder where this back spatter is in the Zapruder film. While there appears to be some mist around the back of Kennedy's

head, this mist is almost certainly related to the large exit defect, which has traveled slightly forward since impact.

(If the skull fragment in Z-313 is traveling at 200 feet per second, as seems reasonable, the bullet impacted at least 1/30 of a second prior to frame 313, as the fragment is 6 or 7 feet above Kennedy in Z-313. This 1/30 of a second delay would place the impact near the middle of the space between Z-312 and Z-313, which were taken 1/18 of a second apart. As the limousine was traveling at 8-9 mph when the bullet impacted, which translates to roughly 12 feet per second, this means the limo traveled at least 5 inches from the moment of impact. This means the supposed entrance on the back of Kennedy's head, at the actual moment of impact, was roughly 5 inches behind its location in frame 313. So where is the back spatter from the "low" entrance noted at the autopsy and currently accepted as the only entrance on the back of the skull by both Lattimer and HSCA ballistics expert Larry Sturdivan? There is no cloud of bloody mist out behind Kennedy's collar.)

There is another troubling aspect to Lattimer's skull tests—the fact that he shot them off ladders. As pointed out by Wallace Milam, the ladders absorbed the forward momentum of the bullet, and rocked forward. The skulls, meanwhile, basically bounced off the ladders back towards the shooter. By placing his skulls on ladders, Lattimer could thereby falsely claim his tests proved that the "back-and-to-the-left" motion of Kennedy's head in the Zapruder film was a normal response to a shot fired from behind, and that the "Jet Effect" from the exploding brain matter caused Kennedy's head to fly backwards.

But Milam is not the first man to dispute the theories behind Lattimer's work. After showing the HSCA two of the skull simulations performed by Olivier in 1964, Larry Sturdivan, the HSCA's wound ballistics expert, testified: *"As you can see, each of the two skulls that we have observed so far have moved in the direction of the bullet. In other words, both of them have been given some momentum in the direction that the bullet was going. This is amplified, however, in these skulls because they are not tied to a human body."*

Lattimer's sneaky ladder trick fooled Sturdivan into repudiating his testimony, however. In his 2005 book *The JFK Myths*, Sturdivan wrote *"Dr. John Lattimer conducted some skull shots that resembled the Biophysics Division's simulations, but for which the skulls were filled with animal brain tissue. In his shots, all skulls fell back from the table in the direction of the shooter. Evidently, the lack of a jet effect from the stiff gelatin in the Biophysics Lab's simulation was a bit misleading and there was enough of a jet effect to move Kennedy's head back after its forward surge."* Sturdivan missed that Lattimer's skulls were sitting on the tops of ladders, not tables.

Shooting Melons Off Tables

At left: a crop from Zapruder film frame 313.

Above: A high contrast image of frame 313 prepared by the Itek corporation in 1976. The inserted arrow points to the back of Kennedy's head. Note that there is no back spatter beyond the back of Kennedy's head, even though the limousine was in motion and the presumed impact location would have to have been roughly 5 inches behind the back of Kennedy's head in this image. Compare this to the three frames at left, where the melon emits back spatter throughout.

Above: three stills from an episode of Penn & Teller's Bullshit. They shot a melon off a table to demonstrate that Kennedy's large head wound occurred as proposed by the Warren Commission. Bullshit

Shooting Melons Off Tables

The TV show Bullshit did shoot something off a table, however: a melon. In a 2005 episode purportedly debunking that Kennedy was killed by anyone other than Oswald, they shot a melon to demonstrate that bullets enter small and exit big, and that Kennedy's wounds could easily be replicated. To show that there was no mystery to Kennedy's back-and-to-the-left movement following the head shot, moreover, they showed the melon falling backwards in slow motion after impact.

They were bullshitting their audience, of course. (People seem to forget that the hosts of the show, Penn & Teller, are first and foremost magicians--illusionists.) That they performed multiple takes in order to perfect their trick is confirmed by the fact that in the long shot melon goo flies out and knocks a pink hat off another melon, but in the slow-motion shot that followed the hat never moves. From what I can gather, the trick works like this: 1) the bullet strikes the melon, imparting energy into the melon, and explodes from the far side of the melon; 2) a portion of this energy is projected downwards as the melon expands; 3) this causes the melon to recoil slightly from the table; 4) due to there now being far more melon missing by the exit than at the entrance of the bullet, however, the primary motion of the melon is to roll backwards and re-establish equilibrium; 5) the poorly secured table, recoiling from the expansion of the melon forwards, tilts back towards the shooter; 6) the melon rolls off the edge of the extremely small table. TA DA! If the table had been a larger table the melon would barely have moved.

If the table had been solidly secured and had not tilted backwards the melon would barely have moved. If the melon had had a flat bottom it would barely have moved.

Of course, there's also the fact that a melon isn't a skull. As the forward momentum created by a bullet's impact is in large part determined by the amount of energy expended while entering and exiting the object receiving the impact, and as a skull is many times more difficult to penetrate than a melon, it only makes sense that a skull would be the recipient of far more forward momentum than a melon. An online paper by mechanical engineer Tony Szamboti estimates that a human skull pierced by a bullet will receive 50-100 times the amount of energy and forward momentum as a melon pierced by a bullet. I suspect he's right. I mean, you can't exactly pierce a skull with a toothpick, can you? This simple fact, apparently overlooked by Nobel Prize-winning physicist Luis Alvarez in his own studies, helps explain why the skulls fired on by Alfred Olivier's team in 1964 moved in the direction of the bullet far better than team member Larry Sturdivan's subsequent guess that the gelatin was to blame.

In fact, when one thinks of it, there was a lot that Alvarez, Lattimer, Sturdivan, and the producers of Bullshit!, for that matter, overlooked. In 1978, Mrs. John Nichols, the wife of forensic pathologist Dr. John Nichols, who'd recently passed on, delivered the results of his most recent shooting simulations, in which Mannlicher-Carcano ammunition was fired upon melons and cadaver specimens. (This paper can be found on the Baylor University website.) Nichols' conclusion read: *"This study did not demonstrate the jet effect and would lead us to reject the jet effect as the basis for President Kennedy's backward head movement."* It detailed, moreover, that, among other things: 1) *"All target movement was in the direction of bullet flight path";* 2) *melons fired upon while sitting on a stand exhibited "bullet entry and exit spray," but did not move upon impact;* and 3) *"Movement of all cadaver specimens was away from gun."*

And that wasn't all those peddling the jet-effect have over-looked. In 1996, Stanford Physicist Art Snyder and his wife Margaret attended the JFK Lancer Conference in Dallas and played some films in which watermelons had been fired upon. Some of these tests had been conducted by Dr. Doug DeSalles in 1994. In any event, these films, subsequently discussed in a 1998 article by the Snyders in Skeptic Magazine, and a Fall 1999 article by DeSalles in the Kennedy Assassination Chronicles, demonstrated an important point missed (or ignored) by Alvarez. While melons did indeed fly back toward the rifle when fired upon by 30.06 rifles firing soft-nosed ammunition (as claimed by Alvarez), they failed to do so when fired upon by Mannlicher-Carcano rifles firing full-metal jacket ammunition. This suggested that the "Jet Effect" identified by Alvarez, and used by single-assassin theorists everywhere to support that Kennedy's back-and-to-the-left motion after being struck suggested the shot came from behind, was directly related to the break-up of the bullet within the melon. As subsequently explained by Szamboti, the break-up of the transiting bullet creates a large temporary cavity expanding in all directions from the bullet. As the bullet exits the melon in pieces, it leaves a large hole, and the forward pressure is released. This, then, leaves the backward pressure pushing against a relatively intact back of the melon, and BINGO, it flies backward.

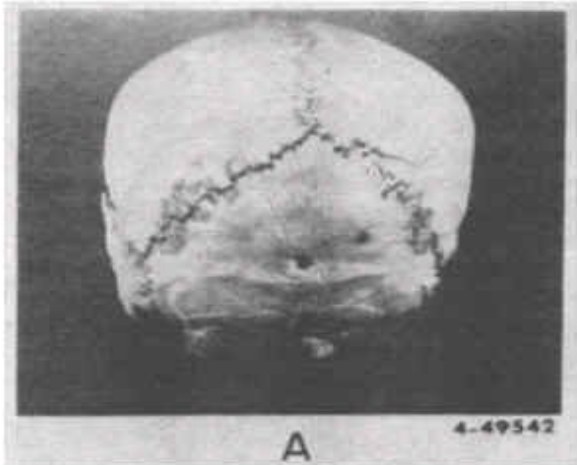

Thus, Kennedy's back-and-to-the-left movement *can* be explained by the "jet effect", provided the skull was as soft as a melon-rind, *and* the bullet broke up within the skull. For only through both circumstances could a tremendous amount of pressure push against the back of the skull without being offset by the forward movement of the skull upon impact.

There's also this: if the rapid expansion of a temporary cavity within the skull caused Kennedy's back-and-to-the-left movement, shouldn't pressurized blood and brain have spurted back out the bullet's entrance?

And so it turns out the melon test on Bullshit was not a waste of time and melon... It once again demonstrated that matter DOES fly back from a bullet's entrance. The melon sprayed fluid backwards

from the entrance as well as forwards from the exit. As Zapruder frame 313, taken within a split second of the bullet's impact, was tested by the ITEK Corporation in 1976 and found to show no signs of spray from the back of Kennedy's head, the melon test supports the possibility that Kennedy was not struck on the back of the head at frame 313.

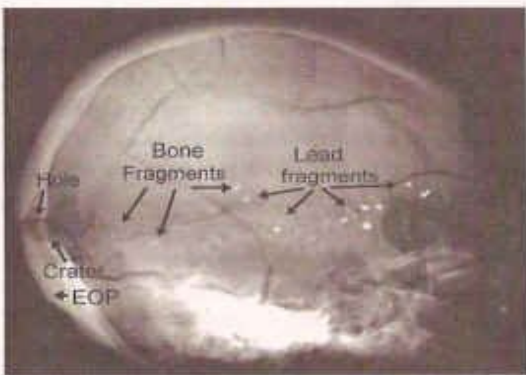

The JFK Myths

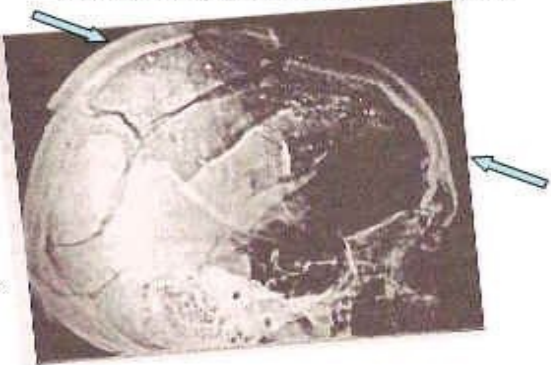

At left and at right: HSCA Exhibit F-306, from the 9-8-78 testimony of Larry Sturdivan. The photo at left is reproduced in Sturdivan's book *The JFK Myths* as Exhibit 51.

Blue arrows point to the "trail of fragments." Why was it so much higher in Kennedy's skull, below, than in the test skull at left?

At left and at right: Figure 38 from *The JFK Myths*. The x-ray at left is from Dr. Olivier's report for the Warren Commission. The x-ray at right is HSCA Exhibit F-53, the right lateral x-ray of President Kennedy.

The JFK Myths

Let's go back to Larry Sturdivan's September 8, 1978 HSCA testimony. As the HSCA didn't have the budget or the desire to test the wound ballistics of 6.5 mm Mannlicher-Carcano ammunition, they relied on the tests performed in 1964 by Alfred Olivier and Edgewood Arsenal. Since Sturdivan was actively employed at Edgewood Arsenal, and had assisted in the 1964 tests, he was given the responsibility of explaining wound ballistics to the committee, and how the tests performed in 1964 were still relevant.

In his testimony, Sturdivan presented photos of yet another test skull to the Committee. In order to show that a bullet creating a small entrance could indeed leave a large exit, Sturdivan presented a skull with a small entrance at its back and a blown-out face in front. It was entered into evidence as F-306. This skull had been one of Olivier's test skulls from 14 years earlier. That the bullet in this test was fired into the thick occipital bone at the back of the skull cut into its value as evidence, however. The HSCA had, after all, relied upon their pathology panel to determine the location of the entrance on the back of Kennedy's skull, and had determined it to have been four inches higher than the entrance on the skull in the photos.

The trajectory of the bullet striking this skull was even more problematic. While the bullet striking Kennedy's skull was purported to have created a large defect at the top of his skull after entering the back, and striking nothing but brain, the bullet creating the large defect apparent on Sturdivan's exhibit had undoubtedly struck the bones in back of the face. This would most certainly have led to the creation of secondary missiles, and a much much larger defect.

The photos were nevertheless revealing. Since the bullet striking low on this skull had exited the face, the photos demonstrated that a bullet fired straight into the skull and striking low on the skull would most likely exit low on the skull, and not sail upwards and out the top of the skull, as so many current supporters of the single-assassin theory, including Sturdivan himself, now contend.

In 2005, Sturdivan released a book explaining his new views. While the book's full title was *The JFK Myths: A Scientific Investigation into the Kennedy Assassination*, and it did indeed debunk many myths, both conspiracy and otherwise, it added a few myths of its own. Here, Sturdivan explained the failure of the 1964 test bullets to simulate Kennedy's wound by asserting that the test skulls were dried, and that a living skull would be more resistant, and that a bullet striking such a skull would be more likely to sail upwards and explode from the top of the head. Maybe someone should tell Sturdivan that bullets don't sail upwards and explode from the tops of live skulls, either.

At another point, when discussing the 1964 tests, Sturdivan writes *"the Biophysic Lab test skulls do not show extensive cracking from the entry holes, even though the dried skulls used in the tests were more brittle than live bone (indicated by more explosive fragmentation at the site of the explosive post-shot rupture). Figure 51 is a typical entry hole from this series. Some had a small crack through the body of the occipital plate similar to this one. Each had, at most, a single crack that ran across the entry hole. None had multiple, displaced cracks radiating from the entry hole."* Sturdivan thereby suggests that the comparatively small entrance hole observed on the back of Kennedy's skull was not unexpected. A close comparison of Figure 51, which depicts the same skull as HSCA Exhibit F-306, with the four Edgewood Arsenal Biophysic Lab test skulls shown on the Reading the Test Skulls slide, however, reveals that the skull in Figure 51 is far from typical. The backs of all four skulls on the Reading the Tests Skulls slide appear to have suffered extensive fractures or are missing bone.

This is most curious. When one reads Dr. Olivier's 1965 report on these tests, one finds that the bullets fired into the ten test skulls *"broke up to a greater or lesser degree in at least nine of the skulls."* This *"at least nine"* is unduly vague. If it was more than nine skulls that would mean ten skulls, which would mean EVERY skull fired upon, right? If the bullet broke up in every skull then shouldn't that have been mentioned? Since the photo in Figure 51 was the only photo of a bullet entrance in Olivier's 1965 report and the only photo of a bullet entrance in Sturdivan's 1978 testimony *and* the only photo of an entrance in Sturdivan's 2005 book, one can't help but be suspicious it was in fact far from typical, and was, in fact, a photo of the entrance on the only skull where the bullet did not break up.

Sturdivan's failure to depict the exit defect in Figure 51 is also suspicious. Since Sturdivan is now of the opinion the bullet entered low on Kennedy's skull in the Humes entrance, and then curved sharply upwards, perhaps he was trying to conceal that NOT ONE bullet curved upwards in such a manner in the 1964 tests, even though *"at least nine"* of the bullets broke up in the skull. and even though Olivier, by Sturdivan's own admission, used *"stiff gelatin"* that would accentuate such a curve.

Sturdivan's treatment of the bullet fragments and x-rays is also revealing. Here is how he described the bullet fragments on the x-rays during his 1978 HSCA testimony: *"this case is typical of a deforming jacketed bullet leaving fragments along its path as it goes. Incidentally, those fragments that are left by the bullet are also very small and do not move very far from their initial, from the place where they departed the bullet. Consequently, they tend to be clustered very closely around the track of the bullet."* Later, he was asked by Congressman Fithian if a bullet fragment will always develop a lift. He

said: *“it will move in the direction it is yawing. If it yaws upwards, then it will tend to move upward. If it yaws down, then it would tend to move down....Unfortunately, the entrance yaw is unpredictable as to direction, so you really can't predict whether it is going to go upward, downward, or to the right or left.”* He then defended the high entrance proposed by the HSCA forensic pathology panel, the very entrance he now says doesn't exist. He said: *“There is extensive deformation at the top of the skull which indicates the radial velocity that was imparted to the tissue, broke it open and, therefore, relieved the pressure at the top...You would presume then, that the soft tissue, which was badly damaged, would have moved somewhat in the direction of that relieved pressure and, therefore, would be displaced somewhat upward from the original track. So I would place the original track as being somewhat lower than the trail of fragments indicated through there, certainly not much lower...there is no indication of any track in the lower half of the skull. It was definitely in the upper part.”* After showing films of the skull tests to the committee, he returned to this theme and once again defended the HSCA entrance as the most logical entrance. He said: *“Once the bullet enters the soft material within the skull, the radial velocity is imparted and the effect is exactly the same no matter at what point it enters. The only effect might be in which portion of the skull is actually blown out. In other words, it might blow out a little higher and a little more toward the top if the bullet entered a little more toward the top rather than blowing out on the side as is indicated in the second exhibit.”*

So, after recently deciding that the bullet entered in the low entrance described at the autopsy, how does Sturdivan now view the x-rays and bullet fragments? In the JFK Myths, he claims: *“many of the fragments deposited in the President's brain were flushed out, along with the brain tissue, as the large amounts of blood flowed out of the explosive wound in the side of his head, in the car and in Parkland. It is evidently some of these that were deposited on the bone flaps by clotting blood that show as a “trail” of fragments near the top of the lateral view. This “trail” does not show on the frontal view, and is much higher than the FPP's reconstructed trajectory. (Note: FPP=Forensic Pathology Panel) In fact, at the apparent location of these fragments there was no brain matter in which the fragments could be embedded.”* Yes, he has once again completely reversed himself, not only on the wound location, but on elementary wound ballistics. While bullet fragments previously did *“not move very far from their initial, from the place where they departed the bullet,”* now *“many of the fragments deposited in the President's brain were flushed out, along with the brain tissue, as the large amounts of blood flowed out of the explosive wound in the side of his head.”*

While Sturdivan is undoubtedly within his rights to change his mind, when he uses his experience as the HSCA's ballistics expert to sell his book, and refutes a number of the HSCA's key findings, and fails to tell his readers that his testimony was vital to these findings, he crosses a line, in my opinion. At one point in the JFK Myths, he writes: *“One hesitates to disagree with the opinions expressed by three panels of expert pathologists who had the autopsy pictures and x-rays to study.”* And yet at another point he admits *“The wound ballistics consultant from the Army's Biophysics Division (the author of this book) was invited to participate in two of the FPP's meetings. During several meetings, the FPP, a few members of the HSCA staff, and other consultants reviewed all the evidence from the autopsy, including the photographs, x-rays, and clothing.”* In an ideal world, he would have followed this admission with a mea culpa grande, confessing that he proceeded to give congress information in sworn testimony he now believes inaccurate. But alas, he ignores this fact completely. While he is, by all accounts, a nice man, Sturdivan's credibility on the JFK assassination ballistics evidence is undoubtedly debatable. He has, after all, given conflicting statements regarding the location of the entrance wound, the location of the exit wound, and the movement of bullet fragments within the skull. What's left?

The Sturdivan School of Wound Ballistics

While Larry Sturdivan, in both his HSCA testimony and subsequent book, *The JFK Myths*, used images from the 1964 tests on the wound ballistics of Oswald's rifle to argue that the rifle would be likely to create the small entrance wound observed

on the back of Kennedy's head, and the large exit wound on top of his head, the skull test films he used to support his testimony in fact prove just the opposite. Here, in skull test film 8167, a gaping wound is created on the back of the head, while the top of the head remains intact. Photos and films of the other skulls suggest this was the rule and not the exception.

The Sturdivan School of Wound Ballistics

Funny I should ask. The climactic moment of Larry Sturdivan's HSCA testimony came when he showed several slow-motion films taken in 1964. These slow-motion films depicted the shooting simulations conducted by Dr. Olivier. Sturdivan's testimony on these films started out badly: "*The movies were taken at approximately 2200 pictures per second. Since the projectile is moving at roughly 2,000 feet per second, we could expect a motion of about 12 inches, 12 to 14 inches between frames as the bullet comes in.*" (Olivier's report on these simulations states: "*Figure A5, part B, shows the camera and lights used to record the sequence of events at a film speed of 4,000 frames/sec.*") Sturdivan's book concurs "*the movie was taken at the framing rate of 4,000 frames/second, over 200 times faster than the Zapruder film.*" The distance traveled by the bullet between frames was therefore more like 6 inches.) Sturdivan continued: "*the bullet has come in from the left, has impacted the skull through the scalp stimulant and is now within the skull. As you can see, the radial velocity that is imparted at the first part of the track has begun to crack the back piece of the skull. This is the very next frame. It shows the fragmented bullet and fragments of the skull being blown away from the front of the skull.... Pieces of the bullet have exited the skull. It is hard to tell whether they have actually gone out of the frame or whether they be incorporated into that white mass which is mostly bone but*

with a little bit of gelatin tissue stimulant in it."

"As you can see, the radial velocity has already begun to fracture the skull extensively along and across the suture lines." Later, Sturdivan would answer Congressman Declan Ford by stating "the skull began to fragment while the bullet was still in passage and so, therefore, you might say that the skull began to come apart almost immediately within microseconds of the impact, continuing to

fracture and move forward.”

In the JFK Myths, Sturdivan expands upon his testimony, and publishes a few frames from one of his skull test films as Figure 33. He dismisses that a large wound on the back of Kennedy’s head would be indicative of a shot fired from the front by claiming: *“This argument is predicated on the assumption that the injury was an exit. It was not. The reader might already have noted that Figure 33 shows what actually happened. The bullet entered the back of the skull and exited in a small spray at the front in*

the space of one frame of the high-speed movie. Only after the bullet was far down-range did the internal pressure generated by its passage split open the skull and relieve the pressure inside by spewing the contents through the cracks. A similar explosion would have taken place if the bullet had gone through in the opposite direction. The only way to distinguish the direction of travel of the bullet is to examine the cratering effect on the inside of the skull at entrance and on the outside of the skull at exit. Thus, whether the explosion was more to the side or back is completely irrelevant.” He then discusses Kennedy’s skull: *“Like the simulations at Edgewood Arsenal, the center of the blown-out area of the president’s skull was at the midpoint of the trajectory—not at the exit point. The midpoint is the point at which the bullet has fully deformed and is giving up the energy at the maximum rate—that is, pushing outward with the maximum force. At its actual point of exit toward the front of his head, the fragment had lost half its velocity and a small amount of mass (more than three quarters of its energy). His forehead was not torn open. The pressure inside the skull at the bullet’s exit location was not high enough to cause the front portion of the skull and scalp to rupture, but the x-rays do show that throughout the president’s skull the individual bony plates were separated at the suture lines and fractured between sutures almost as extensively as those in the simulations.”*

So there you have it. Sturdivan contends that the large defect at the top of Kennedy’s head did not come as a result of the bullet’s actual exit from the skull, but was created instead by the energy it released en route to the exit.

In retrospect, this should not be surprising. The HSCA Forensic Pathology Panel, we should recall, concluded that the bullet exited nearly intact from the beveled piece of bone in the "mystery photo," and that the other half of this exit was found on the large bone fragment found on the floor of the limousine. This left no explanation for the explosion of skull visible in frame 313 of the Zapruder film, especially when one considers that the panel concluded that the bone fragment seen exploding upwards came from a location posterior to the large bone fragment found in the limousine, and on the far side of this fragment from the exit defect.

Even more alarming than Sturdivan’s simply making an assertion that the temporary cavity made by the bullet exploded the skull, however, is that he presents this as though this is what one would normally expect from the impact of a high-velocity bullet on a skull. Now, is this assertion supported by the simulation films he cites as support for his theory? I don’t believe so. Well, what about the writings of others, then? Here, once again, I’m saying no.

One reason to doubt Sturdivan is his contention that at the “*actual point of exit*” the bullet had lost only “*a small amount of mass.*” He overlooks that the copper base of this bullet was found in the front seat of the car, empty of all lead, and that the nose of this bullet was found several feet away. As it would be most unusual for a jacketed bullet to enter a skull intact but break up upon exit, it seems obvious the bullet broke up upon impact, and that the lead fragments seen on the x-rays broke off from the middle of the bullet. If Sturdivan fails to appreciate this obvious conclusion, there’s no telling what else he’s overlooked.

Actually, there is some telling what else he’s overlooked, and here it is... The skull test films depict large fractures running from the entrance locations on the backs of the skulls to the coronal sutures near the fronts of the skulls. Such a fracture line does not appear on Kennedy’s skull. Even worse, while the bullets in the skull tests exploded from the forehead, Kennedy’s face remained intact. Although Sturdivan has recently proposed that the bullet striking Kennedy curled upwards and exploded out the top of his skull, the exhibits he placed into evidence before congress fail to support this conjecture, and he has offered no subsequent tests as support for this proposition.

Sturdivan also fails to see that his basic assertion just isn't true. He states "*Like the simulations at Edgewood Arsenal, the center of the blown-out area of the president's skull was at the midpoint of the trajectory.*" But this is 100% wrong. The available films show that, even though, as Dr. Olivier explained to the Warren Commission, "*you don't have the limiting scalp holding the pieces in,*" (Some studies have concluded that scalp is as much as 50% as strong as bone) the mid-point of the trajectory in the test skulls fractured and separated at the sutures, but did not blow out.

While the final skull test frame in the JFK Myth's Figure 33 shows the skull coming apart and might leave one with the impression that the skull blasted apart, this is an inaccurate impression. When one watches the full simulation as HSCA Exhibit 306, (frames of which are shown above) one sees that the mid-part of the skull regained its form and that the skull, in fact, ended up with a large hole on the back of the head at the entrance and an even larger hole on the front of the head at the exit, with NO hole whatsoever at the top of the head. This is shown below.

And this wasn't an isolated case. It was the same or worse with the other skulls. None of the simulations had a large defect at the top like the one on Kennedy's skull. On NONE of the simulations did a large bone fragment explode upwards as seen in Zapruder frame 313. With but what appears to be one exception, the entrances were not small holes on the bone approximately the width of the bullet,

but gaping holes an inch or more in diameter. Sturdivan's testimony was thereby refuted by...the very exhibits introduced to support his testimony.

Yes We Can Can

Images 1-4 are taken from HSCA Exhibit 304, a film of a high-velocity bullet piercing a tomato can. This film was shown to the committee by Larry Sturdivan. The bulk of the fluid exploded back towards the shooter. That backspatter is the expected result of a bullet's striking a fluid-containing object is further demonstrated by the unrelated image of a bullet's striking an apple. This photo was found on the website of single-assassin theorist Kenneth Rahn.

Yes, We Can Can

Even more surprising, the skull tests were not the only films shown by Larry Sturdivan in his 1978 HSCA testimony that refuted his testimony. To support his statements about the explosion of the president's skull, he showed the committee Exhibit 304, a slow-motion film of a high-speed bullet piercing a tomato can. He describes this film as follows: *"The picture will be much the same as those with the skull. The bullet will be coming in from the left, will strike the can and you will see pieces of the can moving toward the right in the direction of the bullet, but you will also see pieces of the can moving in other directions. Notably the top of the can will be moving back toward the left in the direction from which the bullet came. You notice the backplash as the bullet has entered the left-hand side of the can. The material is beginning to move back out. This is called the backplash of the projectile."* Yes, you read that right. Sturdivan pointed out to the committee that a bullet entering a skull would create a backplash of material from the entrance.

Vincent J.M. DiMaio, in his book *Gunshot Wounds*, described this phenomena as well. He asserted: *"As the bullet enters the body, there is a "tail splash," or the backward hurling of injured tissue."* This

should make one wonder once again why there is no backslash visible in frame 313 of the Zapruder film.

While one might venture that the backslash remained visible for but a brief moment, and was already dissipated within the 1/30th or so of a second between the impact of the bullet on Kennedy's head and the exposure of frame 313, Sturdivan's tomato can film proves this unlikely, as the backslash visible in the Exhibit 304 is still visible long after the amount of forward splash has peaked.

This splashy and colorful simulation is also of interest because it helps debunk the myth that Kennedy's head flew backwards due to the "jet effect". Notice that, in the frames of Exhibit 304 above, while the top of the can flew back towards the shooter, the larger mass of the can flew forwards in the direction of the bullet. If one were to hold that this movement came from a "jet effect" response to the backslash, one would then be forced to return to the last question: where is the backslash in the Zapruder film, and why didn't its "jet effect" thrust Kennedy's skull forwards?

In his testimony before congress, Sturdivan offered his own explanation for the back-and-to the-left movement of the President's skull in the frames following Z-313. He testified: *"Now the extreme radial velocity imparted to the matter in the President's head, the brain tissue caused mechanical movement of essentially everything inside the skull, including where the cord went through the foramen magnum, that is, the hole that leads out of the skull down to the spinal cord. Motion there, I believe, caused mechanical stimulation of the motor nerves of the President, and since all motor nerves were stimulated at the same time, then every muscle in the body would be activated at the same time. Now in an arm, for instance, this would have activated the biceps muscle but it would also have activated the triceps muscle, which being more powerful, would have straightened the arm out. With leg muscles, the large muscles in the back of the leg are more powerful than those in the front and, therefore, the leg would move backward. The muscles in the back of the trunk are much stronger than the abdominals and, therefore, the body would arch backward. The same phenomena has been observed many times by hunters in the Southwest where I came from."*

To support these statements he showed the committee Exhibit 309, a slow-motion film of a goat being shot in the head. He testified: *"First we will observe the neuromuscular reaction, the goat will collapse then, and by the wiggling of his tail and the tenseness of the muscles we will see what I think has been called the decerebrate rigidity, and that takes place about a second after the shot and then slowly dissipates and you will see the goat slump, obviously dead."*

As the film progressed, he narrated: *“Four one-hundredths of a second after that impact then the neuromuscular reaction that I described begins to happen; the back legs go out, the front legs go upward and outward, the back arches, as the powerful back muscles overcome those of the abdominals. That was it.”*

Later, when questioned by Congressman Declan Ford, he disputed that the direction of Kennedy's head movement would have any correlation to the direction of travel of the bullet impacting his head: "*The direction that was imparted by the bullet going forward would have been overcome by the neuro-muscular reaction in about four-hundredths of a second, if we can believe what happened to the animal would be the same in the human being....Four one hundredths of a second, I think, is well between frames on the Zapruder film. So we wouldn't expect to see any forward motion of the head before we saw the violent reaction. In other words, there was very little time to move forward before he began to move backward.*" Sturdivan, therefore, failed to attach any significance to the slight forward movement of Kennedy's head between frames 312 and 313 of the Zapruder film, the movement most single-assassin theorists cite as proof the bullet was fired from behind.

Still later, Sturdivan dismissed another favorite theory of the single-assassin crowd, and rejected the possibility that the cause of the back-and-to-the left motion apparent in the Zapruder film was the "Jet Effect" proposed by Dr. Luis Alvarez and Dr. John Lattimer. He testified: "*It is possible that there would have been enough momentum lost in a forward direction that the skull might have moved backward or at least not move forward as rapidly as it would have otherwise. However, if you recall, in the skull films, most of the momentum was in the side causing the skull to have a reaction in the opposite direction. But each of the skulls did move forward in the direction that the bullet took.*" I wonder how many of today's single-assassin theorists accepting that the forward movement of Kennedy's skull between frames 312 and 313 and the purported "jet effect" afterward demonstrate that the head shot was fired from behind even know that their champion ballistics expert testified before congress that their "proofs" were nonsense.

Sturdivan's explanation had a not insignificant problem of its own. Both his testimony and his goat film suggested that the neuro-muscular reaction he proposed would affect all limbs. Dr. Werner Spitz of the HSCA medical panel shared Sturdivan's analysis; years earlier, he'd told the Rockefeller Commission: "*The subsequent backward movement of the President's head can be explained by sudden decerebration. This position is well known as "decerebrate posture."*

Well, Blakiston's Pocket Medical Dictionary describes "decerebrate posture" as: "*The limbs are stiffly extended, the head retracted...*" This suggests that, if Kennedy's movements were related to a neuro-muscular response, his arms would have straightened out as well as his legs.

They did not; they remained by his side, bent at the elbow, precisely as they were before the bullet impacted on his skull.

As Sturdivan also stated that the goat fell dead, and Kennedy is reported to have lived for more than 20 minutes after he was shot, there is real reason to doubt that Kennedy straightened up as a neuro-muscular response, or that his legs were extended due to sudden decerebration.

But I am not alone in my skepticism. In recent years, Sturdivan's testimony about the neuro-muscular response has come under fire from a most unexpected source: Sturdivan himself. Although he still proposes that Kennedy's body lurched backwards as a neuro-muscular response to the bullet's impact, he now asserts that the rapid acceleration of Kennedy's head backwards after 313 came not from this

response, but from the...jet effect. In the JFK Myths, he declares: *“Dr. Ken Rahn has used the position of the back of Kennedy's head as plotted in Josiah Thompson's book to calculate the velocity and acceleration of the head after the explosion at Zapruder frame 313. Kennedy's head is accelerated rapidly forward (the momentum of the bullet) then rapidly backward, nearly to its original position. The motion is far too soon to be a neuro-muscular response. It had to be from the physics.”* Sturdivan then proposes that the Jet Effect had an effect and that Dr. Olivier's tests at Edgewood Arsenal failed to reveal this effect as a consequence of his ballistics gelatin being just too darned stiff.

Well, no surprise, there's a problem with this. Sturdivan testified before congress that the neuro-muscular reaction takes place within 4/100 of a second. 4/100 of a second is less than one frame of the Zapruder film. The bullet impacts on Kennedy mid-way between Z-312 and Z-313 in the Zapruder film and by Z-315 he is already heading back-and-to-the left. This means the response took approximately 2 frames or, since the Zapruder film was running at 18.3 frames per second, roughly 1/9 of a second. 1/9 of a second is, of course, roughly 11/100 of a second, more than 2 ½ times as long as Sturdivan said it took for a neuro-muscular reaction to occur. And yet Sturdivan now says the reaction comes far too soon for the reaction to be a neuro-muscular reaction. This means that either a) Sturdivan misled congress, or b) he's so anxious to fit in with Warren Commission supporters like Lattimer and Rahn that he'll say almost anything, or c) he doesn't really know what he's talking about.

I'm leaning towards “c.” After all, Sturdivan:

1. testified before congress that the entrance wound was on the upper part of Kennedy's skull, but then changed his mind.
2. testified before congress that small bullet fragments don't stray very far from the bullet's path, but then changed his mind.
3. testified before congress that the forward movement of Kennedy's skull between frames 312 and 313 did not reflect that the bullet impacting his skull had been fired from behind, but then changed his mind.
4. testified before congress that the rapid backward movement of Kennedy's skull following frame 313 was most logically a neuro-muscular response to the impact of a bullet, but then changed his mind.
5. testified before congress that the inch or so of flesh overlying Connally's rib would substantially slow a bullet, so that a bullet striking Connally's rib would suffer much less damage than a bullet striking a much-smaller goat's rib, but that the five and a half inches of flesh in Kennedy's upper back and neck would hardly slow a bullet at all.

Perhaps it's time we make up our own minds...

Chapter 16b: Digging in the Dirt

In which I review the wound ballistics literature and come to a surprising conclusion

Blasts From The Past

Above: Figure 104. At right: Figure 105.

The two figures above, both from La Garde's *Gunshot Injuries* (1916), reveal that, whether or not a WWI-era rifle bullet strikes from back to front (Figure 104) or front to back (Figure 105) the calvarium does not simply explode upwards in the middle of the wound track, as proposed by Sturdivan. Note as well that the entrances are much larger than the entrance found on the back of Kennedy's head, and the exits much smaller than the large defect found on Kennedy's skull.

Blasts From The Past

In 1916's *Gunshot Injuries*, by Louis Anatole La Garde, two similar skulls are displayed. One skull is of a man shot in the back of the head, with the bullet exiting his forehead, and the other skull is of a man shot in the forehead, with the bullet exiting the back of his head. The trajectory connecting these wounds is only slightly lower in the brain than the trajectory of the bullet through Kennedy's brain as proposed by the HSCA. Neither of these skulls, however, demonstrates a disruption at the center of the skull from the explosion of a temporary cavity, as one would expect from reading Larry Sturdivan's book, *The JFK Myths*. In both cases, the entrance of the bullet on the skull was considerably larger than the entrance on Kennedy's skull, and the exit considerably smaller. In both cases, large skull fractures stretched forward from the entrance location. While this is consistent with the fractures in the films shown by Sturdivan, it bears repeating that there are no such fractures on Kennedy's skull. This is incredibly problematic for those, as Sturdivan, who claim Kennedy's wounds to be pretty much what one would expect.

One possible explanation for the failure of these skulls to burst open is that the bullets striking these men transmitted far less energy, and thus created a much smaller temporary cavity in the brain, than the bullet striking Kennedy. But this just isn't true. The bullet striking the skull in Figure 104 was reported to be a Krag-Jorgensen .30 caliber, jacketed bullet. It was fired on an escaping prisoner. This bullet

weighed 220 grains, as compared to the 160 grains of the bullets to Oswald's gun, and traveled at an initial velocity of 2000 fps, as compared to the reported 2165 fps of bullets fired by Oswald's rifle. It was also fired from 90 feet away from its victim, much closer than the distance of the sniper's nest to Kennedy at frame 313 of the Zapruder film, 265 feet.

As the closer proximity of the shooter to the victim pretty much cancels out the slightly faster initial velocity of a bullet fired from Oswald's rifle, this leaves us with the difference in bullet size as the only essential difference between the shootings, (or at least as they've been proposed). The bullet in this shooting was 37.5 % heavier than the bullet hitting Kennedy, and traveling at basically the same speed. So why didn't this bullet burst the prisoner's skull open in the middle, and send large bone fragments sailing across the sky?

The other skull featured in Gunshot Injuries confirms there's a problem. The bullet striking the skull in Figure 105 was a .45 caliber bullet, weighing 500 grains, fired from a Springfield Rifle, with an initial velocity of 1301 fps. This bullet was fired at a cadaver from a simulated 250 yards. A chart found on WWW.frfogspad.com, a webpage devoted to the Springfield Rifle, reports that this bullet would be traveling around 1075 fps at 250 yards. This suggests that the bullet striking the skull in Figure 105, all things being equal, transmitted only about 10% less energy to the brain and skull than the bullet striking Kennedy, while creating a permanent cavity nearly twice as large. Shouldn't this skull also have burst open?

The most palatable explanation is that all things weren't equal, and that the bullet striking Kennedy exploded, and thereby transmitted all its energy to the brain. One can then contrast that the bullets striking these two men did not explode, and that they in fact continued on to strike other objects. This explanation, however, is undercut by Sturdivan himself and his assurance that at the "*actual point of exit*" the bullet striking Kennedy had lost only "*a small amount of mass*." As it's hard to see how an exploding bullet could lose only "*a small amount of mass*," it seems clear that Sturdivan, not unlike Dr. Baden and his HSCA colleagues, doesn't actually believe the bullet exploded. As Sturdivan contends that fragments from this bullet cracked the windshield of the limo, and that another dented the metal trim, and that still another chipped concrete more than 200 feet past Kennedy's location at frame 313, moreover, it seems clear he believes that, not only did the bullet not expend all its energy in the brain, but that it had plenty in reserve. Well then why did Kennedy's skull erupt mid-trajectory, when skulls struck by more powerful bullets on a similar trajectory did not?

Other blasts from the past only amplify this problem. The 1896 Annual Report of the U.S. Secretary of War, found online, presents the autopsy protocols of three men struck in the skull by bullets fired from the Krag-Jorgensen rifle. As we've seen, these bullets were larger and more powerful than the bullets fired from Oswald's Carcano.

The first of these protocols, written by Surgeon L.M. Maus, describes the wound of an apparent suicide victim, with the doctor estimating that the rifle was fired from but one foot away, with the bullet entering the left forehead and exiting from the top of the head. The doctor describes the large wound of both entrance and exit as being 16 cm long by 14 cm wide, which would make it slightly larger than the measured size of Kennedy's wound. He notes, however, that some of this missing bone was still adherent to the lacerated scalp, and that, once this bone was put back into place, the defect was only 6 cm by 6 cm. This is smaller than the defect on Kennedy's skull. This is a bullet more powerful than the bullet striking Kennedy, fired from only a foot away, and it has blasted away less skull at its entrance and exit combined than the bullet striking Kennedy did solely upon exit.

The second protocol, written by Surgeon Alfred C. Girard, describes the wounds of an escaping prisoner shot in the back of the head from 90 feet away. This is clearly the victim whose skull ended up as LaGarde's Figure 104. The protocol, however, fills in that "*a furrow corresponding to the injury to*

the dura mater was plowed through the right hemisphere, in the region of the superior convolution, about half an inch deep." Well, this is interesting, as the bullet striking Kennedy, and, according the HSCA panel, traveling on an almost identical trajectory, created a laceration 4.5 cm below the vertex of the brain. This is about 1 1/4 inches lower on the brain. That the amount of damage to this brain was far less than to Kennedy's is further confirmed by Girard's conclusion that *"Death was evidently caused by the concussion, as no vital parts of the brain were injured and the hemorrhage was not considerable."* Hmm. If that doesn't make one doubt that a bullet entering the purported cowlick entrance on JFK would behave as it purportedly did, I don't know what will. Anyhow, the autopsy protocol for this prisoner also confirms that the exit created by this bullet was much smaller than the exit of the bullet on Kennedy, and was only 1 1/2 inches long by 3/8 inches wide.

The third protocol was also written by Girard, and describes the wounds of another suicide victim. The bullet this time left both a small entrance and a small exit, even while badly fracturing the calvarium. Notes Girard: *"The enormous distension of the skull was striking; skin intact except a small circular opening 2 inches back and 2 inches above the right orbit; and a similar one at the junction of the left temporal and lower third of the parietal region. The head felt like a bag of detached bones. Blood flowed from the nose and ears."* Well, this is already very interesting. The structural damage to this skull was, as expected, considering that this bullet was more powerful than the bullet striking Kennedy and considering that it was fired at point blank range, greater than the damage to Kennedy's skull, but the top of the head did not explode and the exit was much smaller than Kennedy's. Girard notes further *"The actual place of entrance could not be distinguished among the debris...The place of exit was a distinct, small round hole one-fourth by five-sixteenths of an inch at the junction of the squamous portion of the temporal bone and the inferior border of the parietal bone, about 2 inches from the posterior inferior angle."* Girard goes on to theorize that the small size of the entrance and exit of this bullet and the lack of comminution of the skull came as a result of the *"slight resistance offered by the temporal bone."* This, of course, suggests that bone offering more resistance, such as the occipital bone, would lead to larger fractures. So why were the fractures on the back of Kennedy's head so minor in comparison to those by the supposed exit? The protocols published by the Secretary of War should make one doubt both the Warren Commission's and HSCA's interpretations of Kennedy's wounds.

More extensive studies on the wound ballistics of the jacketed ammunition of this era are also available. In *Wounds in War*, published 1898, William Flack Stevenson reported on a series of tests performed under the guidance of Dr. von Coler, at the suggestion of the German Minister of War. These tests were designed to study the wound ballistics of the new jacketed ammunition, just coming into use. The steel or copper-jacketed Mauser bullets fired in these tests were for the most part .311 caliber, and weighed 227 grains. They had an initial velocity of 2,034 fps. These bullets were more powerful than those fired in Oswald's weapon. Nearly 1,000 shootings of animals and dead men were studied, along with the suicidal or accidental shooting of 22 living men. Stevenson reported that *"In bullet wounds of the head at very short ranges, the entrance and exit wounds can be defined as such: the roof of the skull is broken up, and the sutures burst open, but the lines of fracture follow no regular order: the scalp for the most part preserves its continuity and shows apertures only at the entrance and exit holes, from which brain matter protrudes. Even at 110 yards diminution of the destruction is observed: the extent of the injury is not so visible outside: but if the skull can be handled, the shattering of its roof and sides can be distinctly felt, and the splinters perceived to crepitate against each other. Brain matter protrudes at the exit wound, but rarely at the entrance side."*

Thus, at 88 yards one would not expect an explosion of the skull and scalp at the point of the bullet's greatest release of energy, as subsequently proposed by Larry Sturdivan.

But Stevenson didn't stop there: *"From range to range, as distance increases, a regular and steady decrease occurs in the amount of damage to the bony roof. Zones of splintering around the entrance*

and exit holes continue, but lines of fracture unconnected with these apertures, though present, become less numerous. From 1100 yards the lines of fracture are radial about the entrance and exit holes, and at 1760 yards they begin to cease to be observed, though one line of fracture which joins the apertures is always apparent up to this distance. At 1320 yards splintering around the entrance and exit holes is still fairly extensive: but at 1760 yards a clean-pierced entrance hole was first observed in a full skull, similar in all respects to one seen in a skull from which the brain had been removed."

Thus, according to these findings, at 88 yards one would not expect a small round entrance hole on the back of the head, with only a few small stellate fractures emanating from the hole, as was proposed by the doctors conducting Kennedy's autopsy.

Stevenson's description of the damage to the brain is also intriguing: *"The destruction which occurs to the brain itself from bullet hits is, at short ranges, enormous. This is evidenced not only in the immediate neighbourhood of the bullet track, but throughout all the mass of the brain, a considerable quantity of which is driven out through the entrance and exit apertures. As the range increases the injury to the brain diminishes so rapidly that even at 110 yards the bullet may make a small cylindrical channel through it."*

Thus, the damage to Kennedy's brain is also unexpected. If the fracturing of the bullet led it to behave like a bullet fired at much closer range, why was so little, if any, brain matter driven out the entrance aperture?

And it's not as if Stevenson's book or von Coler's tests were out of line with what one will find in other books from this era. They are the rule and not the exception.

In *Fractures and Dislocations*, published 1915, Dr. Miller E. Preston wrote: *"The completely jacketed high-velocity projectile, such as used in the army, may penetrate the head with a minimum of trauma: the wound of entrance is small and clean-cut; the wound of exit is only a trifle larger."* He nevertheless warns: *"Any projectile either low or high in velocity is likely to produce extensive comminution when the skull is struck a glancing blow."* Thus, Preston not only contradicts Sturdivan's assertion that the temporary cavity created by this kind of ammunition would be significant enough to explode skull into the sky, he suggests that the angle of the bullet's entrance may be the actual cause of the extensive damage seen on Kennedy.

Treatise on Fractures in General, Industrial, and Military Practice, published 1921, provides yet another example. Here, Drs. John Roberts and James Kelley presented the findings of yet another German doctor, Ernst von Bergmann, who had fired a *"hard lead, steel-mantled bullet"* from a *"small calibre arm and had an initial velocity of 2,000 feet per second."* This could very well have been Oswald's rifle. Anyhow, von Bergmann fired upon what we can only hope were cadavers, and found *"that with the modern, hard-shell, high velocity bullet at short range, the skull cap, together with the scalp covering it, is torn off. At a range of 50 meters there is a wound of entrance and one of exit, the scalp is preserved, and the skull held together, although the latter was broken into many fragments. At 100 meters there is less destruction of the skull; and the lines of fracture are arranged radially, in part encircling the bullet holes like a bending and bursting fracture. The diameter of the wound of exit is about 20-30 mm..."* Hmmm... It seems more than just a coincidence that this supports von Coler's findings that a skull hit by a bullet like the one striking Kennedy would fracture but not explode into the sky. It also seems more than a coincidence that this description fits the wounds seen on the skulls above almost perfectly, and that Kennedy's skull suffered far more damage.

This metaphorical trip through Google's stacks leads me to conclude then that the damage to Kennedy's skull was not as expected, and that Sturdivan's explanation for Kennedy's wounds just doesn't pass muster.

But who am I kidding? Most readers will, understandably, automatically defer to the opinions of a modern ballistics expert like Sturdivan over a layman such as myself. To better explain wound ballistics and its bearing on this case, then, let's consult some experts from our more recent past.

Blasts From the Present

The scientific community continues to blast away at the Warren Commission's conclusions. The black and white photo below is from Vincent J. M. DiMaio's *Gunshot Wounds*, 1998. It shows the torn scalp discovered when someone is killed by hunting ammunition. Since the bullet striking Kennedy's skull disintegrated in much the manner of hunting ammunition, it only makes sense the scalp on the back of Kennedy's skull would be similarly torn.

So why were NO scalp lacerations on the back of Kennedy's skull reported in the autopsy protocol? Or depicted in the autopsy photos? (As shown in the Groden autopsy photo at far left...)

The photo below, from Tom Bevel and Ross Gardner's *Bloodstain Analysis*, 2008 is also problematic.

The bullet in this photo heads left to right. It demonstrates two important concepts. 1) blood sprays from a skull at an angle perpendicular to the skull's surface, and not in the direction of the bullet; and 2) the relative amount of blood spraying from an entrance or exit is related to the amount of blood in the surrounding tissue, and is not indicative of the direction of the bullet. As a consequence, one cannot say whether the blood spraying from Kennedy's skull in frame 313 of the Zapruder film (which is depicted at far right) sprayed from the bullet's entrance or its exit...

Blasts From the Present

Dr.s Harvey, McMillen, Butler, and Puckett, Chapter III, Mechanism of Wounding, contained in Wound Ballistics, edited by Dr. James Beyer, published by the Medical Department, United States Army, 1962. (Beyer was Kennedy autopsist Pierre Finck's predecessor at the Armed Forces Institute of Pathology.) *"The pressures which accompany a high-velocity missile moving through tissue are enormous. Therefore, it is not surprising to find that a steel sphere fired into the head can produce a temporary cavity in brain tissue, despite the apparent strength of the cranium which must resist the pressure. The cavity formed by a missile in the brain of an intact cranium is of finite size, partly because brain tissue is forced through regions of less resistance (such as frontal sinuses and the various foramina of the skull) and partly because of the stretching of the cranium itself. When the energy delivered is very great, skull bones are actually torn apart along suture lines...The explosive effect of high-velocity missiles within the cranium increases with increased energy. With very high velocities there is complete shattering of the skull, usually along suture lines... Movement of brain*

tissue during expansion of the temporary cavity pushes the bone apart." (Later in this book the tests using "very high-velocity" missiles, in which the skulls usually separated at the sutures, are described in more detail. The missiles in these tests were traveling at 4,000 fps or more, more than twice as fast as the bullet striking Kennedy.) So here we have confirmation that skulls don't normally explode from temporary cavities and that when they do it's usually along suture lines. Kennedy's skull did not explode along suture lines. Not only did the fractures on the right side of the skull not run along suture lines, but there was no separation along suture lines observed on the left side of the skull. There was also little damage to the left side of the brain, which would seem unlikely should the brain have expanded to the degree necessary to explode the skull. It follows then that these experts would consider the explosion of Kennedy's skull highly unusual. As confirmed below...

Dr. James Beyer, as quoted in a 12-19-63 AP article on Kennedy's head wound. (In this article, perhaps inadvertently, Beyer second-guesses the conclusions of his successor at the Armed Forces Institute of Pathology, Dr. Pierre Finck.) *"I'm still surprised at the reported size of the head wound if a normal, completely jacketed, military type bullet was used—and if it did not strike some object, such as a portion of the President's limousine before hitting the president's head." Ordinarily, he said, a military type bullet, if fired from a range of about 100 yards as the fatal bullet apparently was, would cause only a relatively small wound at the point of entry and would not necessarily cause extensive damage inside the skull. In contrast, he said, a soft-nosed hunting-type bullet—whose soft nose tends to mushroom out after striking a target-- could cause a head wound of the devastating type described even though the initial entrance was not large. Also, he said, if an ordinary military-type bullet "just grazed" a portion of the limousine before striking the president's head—without losing much of its energy—the slight instability imparted to the missile could have resulted in the large wound described. Beyer wrote the section on wound ballistics to the Army's official medical history of World War II."* While Beyer was obviously unaware of the tendency of 6.5 mm ammunition to break-up on the skull, his statement that a shot from 100 yards using 6.5 mm military-type ammunition "would not necessarily cause extensive damage inside the skull" is a clear indication that the temporary cavity (which, as we shall see, is larger with intact bullets than non-intact bullets) of Mannlicher-Carcano ammunition was not particularly destructive. This totally contradicts Sturdivan's contention that the temporary cavity of the bullet striking Kennedy was the primary factor in the explosion of his skull.

Dr. Alfred Olivier, 5-6-64 testimony before the Warren Commission. *"This type of a stable bullet I didn't think would cause a massive head wound, I thought it would go through making a small entrance and exit, but the bones of the skull are enough to deform the end of this bullet causing it to expend a lot of energy and blowing out the side of the skull or blowing out fragments of the skull."* Here, Sturdivan's mentor, Olivier, gets around Beyer by suggesting that the explosion of Kennedy's skull was related to the deformation of the bullet on the back of the skull. As none of the dried skulls fired on by Olivier, using rifles and bullets identical to those supposedly used by Oswald, exploded upwards like Kennedy's skull, this explanation is far from satisfactory. Olivier's testimony is interesting, nonetheless, as it supports both that the damage to Kennedy's skull was considered surprising, and that the deformation of the bullet occurred upon impact, and not upon exit. Sturdivan and the HSCA Forensic Pathology Panel, we should recall, both pushed that the bullet remained largely intact until exiting the skull, with Baden actually pushing that the bullet remained intact until impacting the windshield frame.

Dr.s Bergeron and Rumbaugh, Radiology of the Skull and Brain, 1971, chapter on Skull Trauma. *"Violence to a small area stresses the bone only locally and results in an impression fracture. This type of violence must be clearly distinguished from that to a large area, which uniformly stresses the skull as a whole and results in a burst fracture."* This demonstrates that the fracture patterns resulting from a bullet's entrance and exit are distinguishable from burst fractures.

Dr. Alfred Olivier, 2-13-73 letter to Emory L. Brown, Jr. (A copy of this letter can be found in the

Weisberg Archives.) (On the origins of the large fragment purported to be on the back of Kennedy's skull in the X-rays.) *"This metallic fragment was probably deposited when the bullet jacket ruptured on the skull. This rupturing of the jacket was one of the things that surprised me when we tested the bullet (same lot as used by Oswald) against human skulls. Apparently, the gilding metal was fairly soft, allowing these full-jacketed military bullets to act like soft-nosed hunting bullets. If Oswald had used Italian ammunition, which had steel jackets, the head wound would have been much less severe, but probably still fatal."* Ahh, there it is...an acknowledgment from someone well-familiar with such things that the break-up of a jacketed bullet upon impact with a skull leads it to act like hunting ammunition, and thereby increases the severity of the wound.

Dr. Alfred Olivier, 4-18-75 testimony before the Rockefeller Commission. *"When that bullet entered the head the nose of the bullet erupted on the skull and expended a tremendous amount of energy. This caused what is known as a temporary cavity. Apparently, this cavity was nearer the side of the head so that it buried in that area, and say, took the path of least resistance. If the bullet path had been near the top of the head it could have burst through the top."* This statement confirms that Dr. Olivier believed 1) the bullet broke up on the outside of the skull; 2) the break-up of this bullet was the decisive factor in the creation of the large temporary cavity, and 3) a temporary cavity will take the path of least resistance. This last point suggests that a large exit created by a permanent cavity will moderate the damage done by the subsequent temporary cavity. It also raises the question, overlooked in both Dr. Humes and Dr. Olivier's Warren Commission testimony, of whether the small entrance wound on the back of Kennedy's head gave the appearance of a wound where a bullet had broken up on the skull.

Dr. John Lattimer, 10-23-75 letter to Emory Brown, Jr. (A copy of this letter can be found in the Weisberg Archives.) (On tests he'd performed on M/C ammunition) *"These bullets keep on going straight ahead in the wood. These same bullets will fragment exactly like a soft-nosed bullet, if they strike the skull, exactly as President Kennedy's skull was struck."* Well, here it is again...confirmation that the bullet striking Kennedy's skull behaved like soft-nosed hunting ammunition. This supports Olivier's statements suggesting that the bullet's explosion and the skull's explosion are inter-related, and that one can not simply propose that the bullet didn't break up at impact, a la Sturdivan and Baden, and still have the severity of the exit make sense.

Dr.s Charters and Charters, Journal of Trauma 1976, Wounding Mechanism of Very High Velocity Projectiles. *"The magnitude of the temporary wound cavity is dependent upon the energy imparted by the projectile during penetration of the tissue, since the energy released decreased exponentially with the distance penetrated."* In support of this statement, Charters and Charters published test results demonstrating that fragmenting stainless steel spheres penetrate shorter distances and create smaller temporary cavities than non-fragmenting spheres. Since the bullet striking Kennedy was badly fragmented this suggests that the largest temporary cavity inside his skull, and the greatest stress on the skull, was nearest the entrance, not the exit. This in turn casts doubt that the large defect on the top of Kennedy's skull (a good distance from the low entrance formerly proposed by Olivier and currently proposed by Sturdivan) was created by the temporary cavity of a disintegrating bullet. Perhaps this is why Sturdivan now proposes that the bullet lost little of its mass prior to exit.

Dr. Frank P. Cleveland, Chapter XXII, Characteristics of Wounds Produced by Handguns and Rifles, contained in Forensic Pathology: A Handbook for Pathologists, edited by Dr. Russell Fisher (of the Clark Panel) and Dr. Charles Petty (of the HSCA Forensic Pathology Panel), published by the U.S. Department of Justice, 1977. *"Wounds from high velocity projectiles. Increasing the velocity of projectiles increases geometrically the quantity of energy produced and this produces perforating wounds with unusual features: bone may literally be pulverized; soft tissue laceration may be widespread and at considerable distance from the track of the projectile; lacerations may be observed within the intima of arteries; exit wounds may be unusually large."* (List of

characteristics of typical wounds of entrance) *"Entrance, tight contact...(2) In the Skull (a) Stellate lacerations radiating from the central defect (b) Marginal abrasions (contact ring), powder residue deep in the wound (c) Gaseous residue distributed along fascial planes (d) May be internal explosive fractures of skull (e) Bone fragments become secondary missiles (f) Peripheral abrasions around contact ring from barrel and sight."* (List of characteristics of typical wounds of exit) *"(1) Lacerated irregular defect with everted margin and subcutaneous fat protrusion. (2) May be larger than entrance wound, secondary to deformity of bullet or secondary missiles (i.e. bone)." This handbook, prepared for the Justice Department, supports that the explosion of Kennedy's skull was far from typical. While this handbook was written for civilian pathologists, and does not specifically address military rifle wounds, it bears repeating that the rifle wounds seen by civilian doctors are most frequently caused by hunting ammunition, and are of a more explosive nature than the wounds caused by full-jacketed military ammunition. The handbook's representation of "explosive fractures of the skull" as "internal", and its simultaneous assertion that exit wounds are larger than entrance wounds due to a "deformity of bullet or secondary missiles" is therefore at odds with Sturdivan's subsequent proposal that temporary cavities are explosive externally, and the primary cause of the large exit defects observed in association with high-velocity projectiles. Should one assume, moreover, that the depiction of "typical" exit wounds in the handbook was inaccurate, and that this had escaped the attention of its editors, Fisher and Petty, one should be aware that they'd added a footnote to the second point regarding exit wounds in order to explain that exit wounds in areas supported by clothing do not resemble the usual exit wound. From this it can be assumed that if they'd had any problems with Cleveland's discussion of exit wounds, and his failure to cite the temporary cavities of high speed projectiles as the primary cause for the large exits associated with their passage, they would have added another such footnote. Since they did not, we can assume they did not.*

Larry Sturdivan's testimony before the HSCA, 9-8-78. *"As a bullet deforms it also increases its presented area, and therefore, a deformed bullet will have a much greater drag than a non-deformed bullet."* This backs up what we've just discussed—that the energy release will be greatest when the bullet is most deformed, but intact. This statement also casts a shadow on the likelihood that a bullet deforming on the bones of the skull, and "erupting on the skull" as per Olivier, would leave an entrance defect smaller than its caliber. The bullet entrance measured at autopsy, let's remember, was only 6mm in its smallest dimension.

Report of the HSCA Forensic Pathology Panel, 1979. *"This energy transfer produces a temporary cavity as described earlier, which actually develops after the bullet has passed through the tissue. Accordingly, a bullet can pass through a head and be almost 100 feet further along before a photograph reveals the explosive destruction of the head. This also explains the presence of entry and exit holes in bones and tissue even though the skull is extremely fragmented or blown apart by the subsequent formation of the temporary cavity. The velocity of the outward-moving tissue particles may be only 125 feet per second, far less than the 1,000 to 2,000 feet per second velocity of the bullet projectile."* This supports Sturdivan's statements that the cratering or beveling patterns on the skull closest to the entrance and exit will reveal the direction of fire even if a subsequent temporary cavity explodes the skull. This also supports our contention that the fractures deriving from the explosion of the temporary cavity would occur after the fractures created by the entrance and exit.

Michael S. Owen-Smith, High Velocity and Military Gunshot Wounds, 1981 from, Management of Gunshot Wounds, 1988. *"if the bullet fragments on impact, all the energy will be used up in creating horrendous wounds... When the skull is filled with gelatine and a bullet fired through it at the same velocity the liquidlike medium behaves like the brain and allows the hydro-dynamic pressure wave of cavitation to blow the skull bones apart from within, causing gross 'eggshell' fracturing of the skull."* While Owen-Smith's mention of "eggshell" fracturing" might lead one to conclude that study of

these fractures to determine the entrance and exit of the bullet is a waste of time, this isn't true. Included with his article are two photographs—one of a 7.62mm bullet's entrance on an empty skull, and one of a 7.62mm bullet's entrance on a skull filled with gelatin. On the skull filled with gelatin, large stellate fractures derive from the entrance, and a piece of skull by the entrance is missing. This entrance more closely resembles what is supposedly the EXIT on Kennedy's skull than what is supposedly the entrance. It is also intriguing that Smith chooses to demonstrate the effect of cavitation on a skull by comparing the entrance locations of the bullets and not the exits. This suggests that the effects of cavitation are more apparent at the entrance than the exit. Yet another point to consider is that, while the 7.62mm bullet fired from 14m in Owen-Smith's tests would create a much more powerful impact on a skull than a 6.5mm bullet fired from the sniper's nest at Kennedy, the fractures deriving from the opening on the top of Kennedy's head, as well as the loss of bone, were greater than the fractures and missing bone by the entrance on Owen-Smith's exhibit. This suggests that the forces creating Kennedy's large defect were more powerful than one would normally expect from the temporary cavity of a 6.5mm bullet.

Dr. Vincent J.M. DiMaio: Practical Aspects of Firearms, 1985. *“the fact that the fractures in a skull are due to temporary cavity formation was demonstrated by a series of experiments with skulls. When skulls were empty, the bullets “drilled” neat entrances and exits without any fractures. When the skulls were filled with gelatin to simulate the brain, massive secondary skull fractures were produced.”* This supports Owen-Smith's statements, but with the acknowledgment that fractures created by cavitation are “secondary.” This means they would come to an end when reaching “primary” fractures, i.e. fractures created by the bullet's impact. This simple fact proves helpful when interpreting the x-rays.

Dr. Martin Fackler, What's Wrong with the Wounds Ballistics Literature and Why, July 1987. *“In the Vietnam Era, the major role played by bullet fragmentation in tissue disruption was not recognized due to “Idolatry of Velocity”...Despite the recent evidence, a generation of surgeons and weapon developers has been confused and prejudiced by the assumption that “high velocity” and “temporary cavitation” were the sole causes of tissue disruption...”* According to Dr. Olivier's testimony before the Rockefeller Commission, Edgewood Arsenal, his and Sturdivan's employer, did the original work comparing the M-14, the M-16, and the AK-47. These were the rifles of the Vietnam Era. Olivier testified, furthermore, that *“as a result of our work, we adopted the M-16.”* This puts Olivier and Sturdivan on the opposite side of the fence from the well-regarded Fackler, and in the company of "velocity-worshippers."

“To further confuse the issue, pressures of up to 100 atmospheres are incorrectly attributed to temporary cavitation by many authors...Temporary cavity tissue displacement can cause pressure of only about 4 atmospheres.” So here we have the most respected man in the field of wound ballistics today raining on Sturdivan's parade. Fackler obviously does not subscribe to Olivier and Sturdivan's theory that the explosion along the top of Kennedy's head was caused by the temporary cavity.

“A similar temporary cavity such as that produced by the M-16, stretching tissue that has been riddled by bullet fragments, causes a much larger permanent cavity by detaching tissue segments between the fragment paths. Thus projectile fragmentation can turn the energy used in temporary cavitation into a truly destructive force because it is focused on areas weakened by fragment paths rather than being absorbed evenly by the tissue mass. The synergy between projectile fragmentation and cavitation can greatly increase the damage done by a given amount of kinetic energy.” Thus, the temporary cavity of a fragmenting bullet (such as a tumbling M-16 bullet or a Mannlicher-Carcano bullet breaking up on the skull) will release more energy into the permanent cavity, and fail to expand at the rate of the cavity created by a non-fragmenting bullet imparting an identical amount of energy into the brain. This is not to say the temporary cavity created by a fragmenting bullet will be automatically smaller than that created by an intact bullet, as suggested by Charters and Charters research. It seems clear, though, that

the ratio of permanent cavity to temporary cavity is reduced by the bullet's fragmentation. Thus, while an intact bullet traveling sideways within the skull may leave a permanent cavity an inch wide, and create a temporary cavity three or four inches wide, a fragmenting bullet that breaks up within the skull may create a permanent cavity two inches wide, and a temporary cavity three to four inches wide. The fact that the bullet striking Kennedy both fragmented and had sufficient energy to damage the windshield, windshield frame, and cement curb, then, suggests that its temporary cavity was not as explosive as it would have been had it remained intact and expended all its energy in the brain.

Confused? So was I until I came across a simple analogy in a book by Dr. Vincent J. M. DiMaio. He compared the temporary cavity to the waves created by a boat on a lake. Well which creates a bigger and more powerful wave along the shore, one large boat or ten small ones adding up to the same displacement in the water? The one large one, correct? Why? Because the wakes of the smaller boats are directed towards each other as well as the shore. This crashing of the wakes into each other is what, in Fackler's words, detaches the tissue segments between the fragment paths, and creates the large permanent cavity.

“Temporary cavitation is no more than the pushing aside of tissue. The distance the tissue is displaced depends, among other things, on its weight. As might be expected, a given projectile will cause a temporary cavity of smaller diameter in a larger limb because of the increased weight of the mass being moved. This has been proved experimentally...” This can be taken as support for Sturdivan's theory in that it suggests the temporary cavity was greatest near the exit on the top of Kennedy's skull. But if the extra weight/pressure at the back of Kennedy's head kept the temporary cavity from expanding upwards, shouldn't it also have forced more fluid back out the entrance, and created a noticeable spray of back spatter?

Smith et al, Cranial Fracture Patterns and Estimate of Direction from Low Velocity Gunshot Wounds, Journal of Forensic Sciences, September 1987. *“A bullet entering the skull produces an entrance wound and a series of radial fractures extending across the skull in advance of the bullet to relieve hoop stresses. Concentric heaving fractures develop in successive generations connecting the radial fractures as the wedges are lifted up. Upon exit there is another series of radial and concentric heaving fractures produced that are of lesser magnitude, have fewer generations, and may be arrested by preexistent fracture lines.”* This raises a few questions. As the fracture patterns of entrance and exit are created almost simultaneously with the impact of the bullet, and precede the fractures created by the temporary cavity, why are there NO large fractures deriving from the entrance on the back of Kennedy's head, and why are there ENORMOUS fractures deriving from the supposed exit? The bullet at the entrance was of larger mass and traveling at a much greater speed than the fragments believed to have impacted at the supposed exit.

Dr. Philip Villanueva, chapter on Cranial Gunshot Wounds, Management of Gunshot Wounds, 1988. *“The shape of the cavitation is theoretically conical, with the apex of the cone being farthest away from the entry...In reality, the projectile's path often varies from a straight track, causing an irregular shaped cavity.”* This supports Sturdivan's conjecture that the bullet could curve upwards while crossing the skull. It still fails to explain, however, why no path for a bullet heading upwards in the skull from the supposed entrance near the cerebellum to the supposed exit near the coronal suture has ever been ascertained, either at autopsy or afterward. After all, if the bullet had traveled on such a trajectory, while fragmenting, it would have created a large permanent cavity, and have left small bullet fragments within this cavity, far from the surface of the cerebrum. So where are these fragments? Sturdivan's latter-day assertion that these fragments would have been uniformly flushed upwards with the explosion of the temporary cavity makes little sense, as it seems clear that at least some of these fragments would have been embedded deep within the brain.

Dr. Edward Pechter, chapter on Gunshot Wounds of Soft Tissue and of the Hand, Management of

Gunshot Wounds, 1988. *“The maximum displacement of the temporary cavity is related to the point of maximum retardation in velocity of the projectile. A missile that loses velocity rapidly will produce a temporary cavity with its maximum dimension near the entrance wound. A pointed bullet will need a longer penetration depth before the maximum size of its temporary cavity is produced unless the bullet is constructed so as to tumble very quickly. As a shaped, elongated bullet tumbles, the maximum energy release will occur near the place where it reaches 90 degrees of yaw.”* So here we have a doctor once again supporting what before we’d only theorized—that the temporary cavity of a deformed bullet rapidly losing velocity will be largest near the entrance. Pechter’s statement suggesting that some pointed bullets are designed to tumble very quickly is a pointed (sorry) reference to M-16 bullets, which are designed to tumble and break-up and create the large permanent cavities discussed by Dr. Fackler. Since the bullets used in Oswald’s gun were not designed to tumble, one might take from this that they would tumble at a later point, nearest the exit, and break up at that point. One might even try to use this to defend Sturdivan’s theory. But one would be wrong. Olivier’s tests in 1964 established that the 6.5mm bullets fired in Oswald’s rifle would be unlikely to tumble in soft tissue, and that, furthermore, would not break up if they did tumble. Sturdivan knew this. When testifying about the “magic” bullet, he told the HSCA: *“It is slightly deformed which, through my calculations, indicate it must have been deformed on bone since it could not have deformed in soft tissue.”* So really what’s in dispute here? Sturdivan seems to agree that the bullet striking Kennedy at frame 313 fractured upon entrance, but is apparently of the belief it came apart as it tumbled upwards in the skull. Since skull fractures occur almost instantly, and since we can assume copper jacket fractures happen just as fast, I contend, on the other hand, that the purported bullet would be in pieces even before it entered the skull, and would begin tumbling almost immediately, and losing its energy almost immediately. This, if correct, casts great doubt that a temporary cavity from this bullet exploded the skull by the bullet's exit, but failed to push any back spatter out the entrance. The x-ray of the Olivier test skull presented by Sturdivan as Figure 38 in *The JFK Myths* (and as shown above on *The JFK Myths* slide) shows that bullet fragments were retained in the middle of the skull. As these bullet fragments would most certainly have continued forward from where they broke off from the bullet, the bullet used in this test undoubtedly broke up on the back half of the skull.

Dr. Gary Ordog, chapter on Wound Ballistics, Management of Gunshot Wounds, 1988. *“The bullet loses velocity on passage through the tissues, and the entrance wound tends to be larger than the exit wound if the missile is a perfect sphere. For missiles that are not spheres, the size of the entrance wound depends on the area of presentation of the missile at the moment of impact, as well as the size of the temporary cavity formed. Thus, the size of the entrance and the exit wound of a fully jacketed bullet depends on the bullet’s yaw in flight through the air and the tissues. If the bullet strikes the tissue head-on and tumbles through, and then leaves the body, then the exit wound will be larger than the entrance wound. When the bullet enters and exits head-on, the entrance wound may be larger because of a larger temporary cavity caused by higher-velocity near the entrance.”* So here we have it again. Ordog confirms our suspicion that the temporary cavity makes more of an impact on entrance size than exit size, and that it is the tumbling or break-up of a bullet that creates a larger wound at exit. While an intact bullet that tumbles just before it exits will create a larger temporary cavity nearest the exit, there is no reason to believe the bullet entering the back of Kennedy’s skull remained intact till just before the exit.

“The bullet’s angle of impact on the target can greatly influence the drag coefficient and amount of tissue damage. The more acute the angle is to the skin, the more surface area is presented to the tissue, thus increasing the wounding energy and amount of tissue destruction.” This suggests the possibility that the area with the most tissue damage, the large defect, was in fact the impact location of a bullet traveling at an acute angle to the skin. More on this to come...

Massad Ayoob, The JFK Assassination: A Shooter's Eye View, American Handgunner, March/April 1993. *"The explosion of the President's head as seen in frame 313 of the Zapruder film is simply not characteristic of a full metal-jacket rifle bullet traveling at 2,200 fps or less. It is far more consistent with an explosive wound of entry with a small-bore, hyper-velocity rifle bullet traveling between 3,000 and 4,000 fps, and probably toward the higher end of that scale ...An explosive wound of entry occurs when a highly liquid area of the body, such as the brain, is struck by a high velocity round. The tissue swells violently during the microseconds of the bullet's passing, and seeks the line of least resistance. That least resistance is the portal of the entry wound that appeared a microsecond before, and the bullet will not bore an exit hole to relieve the pressure for another microsecond or two--perhaps not at all if the bullet fragments inside the brain. If the cataclysmic cranial injury inflicted on Kennedy was indeed an explosive wound of entry, the source of the shot would have had to be forward of the Presidential limousine, to its right, and slightly above...the area of the grassy knoll."* So here we have a respected gun expert and author laying it all out...Kennedy's large head wound is not at all what one would expect from the ammunition used in Oswald's rifle, should it have impacted as claimed by the likes of Olivier and Sturdivan. His words also suggest that, if the bullet impacted as proposed by Olivier and Sturdivan, and Kennedy's head exploded as a consequence of the temporary cavity created by the bullet, blood and brain matter would most certainly have sprayed back out the entrance. But Ayoob doesn't stop there...

"The evidence does not rule out the possibility that a hyper-velocity rifle bullet evacuated the President's cranial vault without any other bullet hitting him in the head. The 6.5mm Carcano throws a 162 gr. bullet at a bit under 2,300 fps muzzle velocity. The closest commonly used cartridge to it in terms of ballistics is probably the .30/30, which has a .308" diameter. The Carcano round, about a .263" diameter. Ask any homicide detective if he's ever seen a .30/30 round blow a man's head up at 55 to 60 yards, exploding the calvarium up and away from the body proper. Ask any hunter of deer-size game if he's ever seen the same thing at that distance. It happens only at very close range with that ballistic technology. The wound we see happening in frame 313 in the Zapruder film--and see the results of most clearly in frame 337--is simply not consistent with this rifle cartridge, at that distance in living tissue. It is particularly inconsistent with a round-nose full metal-jacket bullet of the type Oswald had in his rifle." Here Ayoob re-stresses the point. Bullets like those fired in Oswald's rifle just don't do what we've been told they do. They just don't send pieces of skull flying across the sky when fired from a distance. This is so clear to Ayoob in fact that, even in the conclusion to his article, where he postulates that Oswald quite possibly acted alone, he does so only under the proviso that the bullet striking Kennedy at frame 313 *"for unexplainable reasons did damage out of all proportion to its ballistic capability as most of us would perceive that to be."*

Dr. John Lattimer, speaking at The Second Annual Midwest Symposium on Assassination Politics, Chicago Illinois, April 3, 1993. (While discussing Warren Commission Exhibit 388, a drawing of Kennedy's large head wound.) *"And again, the wound here depicted in this type--in the Warren Commission--I was familiar with this kind of wound from World War II, from this kind of bullet. And it was clearly not what I expected. But when I saw the x-rays and photographs, it was exactly as anticipated--a large wound of exit, cracks in all directions..."* Here, Lattimer sticks to his story that the Rydberg drawings were misleading and that Kennedy's wounds were much more severe and exactly as he'd have predicted. In this presentation he also discussed the fact that he didn't think skull fragments exploded upwards like the fragments captured in frame 313 of the Zapruder film. He then showed photos of skulls fired on by him where the fragments did explode upwards, and claimed these tests convinced him that Kennedy's head wound wasn't so unusual after all. He failed to note that these skulls were dead dried skulls without any scalp to hold the fragments in place. He did note, however, that he thought his tests were more successful than Olivier's 1964 tests because he was firing at the top of the skull and not the bottom. This suggests that he knew full well that the Warren Commission

scenario of a small bullet entrance low on the skull and an enormous exit at the top of the skull made little sense. (Lattimer, of course, later changed his mind about this entrance location, and thereby nullified the tests he'd found so convincing.)

Dr. Vincent J. M. DiMaio, Gunshot Wounds, 1998. *"The size and shape of the temporary cavity depend on the amount of kinetic energy lost by the bullet in its path through the tissue, how rapidly the energy is lost, and the elasticity and cohesiveness of the tissue. The maximum volume and diameter of this cavity are many times the volume and diameter of the bullet. Maximum expansion of the cavity does not occur until some time after the bullet has passed through the target...The maximum diameter of the cavity occurs at the point at which the maximum rate of loss of kinetic energy occurs."* This supports what we have already discussed.

"Intermediate range and distant head wounds show a wide range in the degree of severity, depending on the style of bullet and the entrance site in the head. Anything that tends to produce instability, deformation, or breakup of the bullet as it enters the head results in more extensive injuries. Thus, bullets entering through the thick occipital bone cause greater injuries than those entering the temporal area. Intermediate and distant range wounds of the head can be just as devastating as contact wounds. This is especially true for hunting ammunition. As the hunting bullet rapidly expands, shedding fragments of core and sometimes jacket, large quantities of kinetic energy are lost in the cranial cavity. This produces a large temporary cavity with resultant high pressure, all within the rigid framework of the skull. The pressure produces extensive fragmentation of bone and brain tissue. Location of entrance and exit wounds may require extensive reconstruction of the skull, with careful realignment of the edges of the scalp and bone. Rarely, the entrance in the skin cannot be determined with absolute certainty. This is more common with exits, however."

Distant and intermediate-range entrance wounds in areas overlying bone--typically the head--may have a stellate appearance suggestive of a contact wound. This is probably due to the temporary cavity ballooning out skin that is tightly stretched over bone, with resultant tearing of the skin."

DiMaio illustrates this point with the photo on the Blasts From the Present slide, above. This photo reveals the massive scalp lacerations created by the impact of a .30 30 hunting bullet upon a human skull. While Oswald's rifle was not as powerful as a .30 30 rifle, and while the bullet striking Kennedy was not in fact a hunting bullet, the bullet's near total deformation upon impact--as noted by both Olivier and Lattimer--would lead it to behave much like a hunting bullet, and release a significant amount of its energy into the skull upon entrance. So why were there no significant tears in the scalp apparent by the "entrance" on the back of Kennedy's head? And why did all the scalp lacerations noted at the autopsy derive from the purported "exit"? And why, when the temporary cavity in this skull exploded back out the entrance, did the temporary cavity in Kennedy's skull, according to Sturdivan, explode from the mid-point of his skull between the bullet's entrance and its exit? While DiMaio's observations raise serious doubts about Sturdivan's theories, they also raise questions about the work performed by Olivier and Sturdivan back in 1964. Why, for instance, were none of the entrances on the animal skin attached to the back of Olivier's test skulls photographed or measured for his report? Was Olivier trying to hide that there were stellate tears by the entrance?

Ironically, DiMaio's observations also raise doubts about his own objectivity. According to Doug Horne, who interviewed DiMaio for the ARRB in 1998, Dr. DiMaio made it clear even before being shown the autopsy photos that he felt "the Clark Panel and the HSCA panel had gotten everything right," and "declared with great certainty" that the red spot in the cowlick "was a classic bullet entry wound." Well, that's the problem. DiMaio's own writings demonstrate that a high-velocity entrance wound in which the bullet fractures upon impact should not remotely resemble a "classic bullet entry wound."

In 1998, DiMaio also worked as a consultant on a British TV program hosted by Roger Moore. His comments in this program were slightly more illuminating.

Dr. Vincent J.M. DiMaio, The Secret KGB JFK Assassination Files, 1998. *"The only type bullet that would produce so extensive a network of fractures in the skull is a bullet traveling at a very high velocity. Okay? A rifle bullet essentially. So when it comes in it makes usually a relatively neat hole and when it comes out it produces a very large exit, especially if the wound is very superficial. Actually, if the wound is deeper, like from here to here (as he says this, he points to the EOP area on the back of his head with his right hand and his forehead with his left), the exit wound is smaller, because the force generated by the bullet going through the brain can be absorbed by the whole head. Here (as he says this, he covers the crown of his head--the site of the HSCA's cowlick entrance, and the entrance used in the program's tests--with his right hand) it's kind of like just ripping off the top of the head. So when we see at the exit--see blood and tissue ejected in a cloud, a veritable cloud, a mist-like cloud, pink in color, and this is vaporized blood, and there are little droplets all over--less than a millimeter, just tiny. And so you have a cloud of blood, and this is what the motorcycle riders drove into. They drove into a cloud of blood."* Thus, DiMaio's belief that the purported cowlick entrance was the actual entrance on Kennedy's head comes not just from this purported entrance's giving the appearance of a "classic bullet entry wound," but from his opinion that a bullet entering low on Kennedy's head and exiting high on his head would not create the massive exit wound seen in the autopsy photos. He thereby disputes Sturdivan's most recent conclusions.

Dr. Mark A. Liker, Dr. Bitzhan Aarabi, and Dr. Michael Levy, chapter on Missile Wounds of the Head, Missile Wounds of the Head and Neck, 1999. *"The skull can also increase the bullet's destructive potential by slowing the missile down. Next to teeth, bone is the densest tissue in the body. Therefore, when a bullet strikes the skull, the missile will rapidly decelerate, often fragmenting or deforming in the process. The result is significant energy transfer from the bullet to the head. Deformation helps maximize energy transfer because the bullet's surface area increases, allowing the tissue to exert more drag force on the bullet. As drag increases, the bullet decelerates and more energy is transferred to the tissue. If the collision between bullet and skull results in the bullet's fragmentation, the brain injury is likely to be more severe. This is due not only to multiple missile tracks, but also to the tendency for fragments to behave as slower-velocity bullets that deposit all of their energy into the brain. Thus, if a high-velocity missile does not fragment upon impact with the skull, it may spare the brain some of its energy by exiting the skull; if, on the other hand, the missile breaks into fragments, the likelihood of a complete energy transfer increases dramatically."* Thus, Sturdivan's belief that the bullet lost little mass within the skull, and his concurrent belief that a fragment from this bullet went on to chip concrete more than 200 feet past Kennedy (as measured from the sniper's nest) indicate there was a far from complete transfer of energy from the bullet into the skull. Sturdivan's contention that small fragments were released within the skull and exploded upwards with the rush of blood, moreover, does little to offset this problem, as these fragments, by Sturdivan's own admission, had little mass and thus little energy to impart into the brain. As discussed by Fackler, furthermore, what little energy was released by these fragments would contribute as much to the permanent cavity as to the temporary cavity.

Sturdivan's contention that a bullet struck Kennedy low on the back of his head and that the temporary cavity created by this bullet subsequently exploded his skull is therefore rejected.

A study by Dr. W.M. Hammon, and published in the Journal of Neurosurgery in 1971, supports this conclusion. While this study, entitled "Analysis of 2,187 Consecutive Penetrating Wounds of the Brain from Vietnam" included victims of low-velocity ammunition and shrapnel, the mortality rate of those reaching the hospital was under 30%. This seems unlikely if the mere passage of a bullet through the brain could cause the explosive wounds seen on Kennedy.

A more recent study confirms this conclusion. This study, conducted by the faculty of Ankara University in Turkey, and published in *Neurologia Medico-Chirurgica*, a Japanese neurology journal, in 2005, described the progress of 80 patients brought into Diyarbakir Military Hospital with high-velocity gunshot wounds to the head. Although the bullets creating these wounds were presumably smaller than the bullet creating Kennedy's head wound, they were purportedly traveling at a much greater speed, as the article defined "high-velocity" as traveling greater than 3,000 fps. They were also created by modern military ammunition, which, although more stable than hunting ammunition, which is designed to expend all its energy in its target, is less stable than the ammunition used in Oswald's gun, and would, as a result, be likely to impart more energy into the brain. If Sturdivan's statements are true, and the temporary cavity of the bullet in Kennedy's brain exploded his skull mid-way between the entrance and the exit, then the wounds observed in this study should have been even more severe than Kennedy's wound.

They were in fact not as bad. According to the doctors writing the article, the wounds observed displayed "*huge and distant tissue damage caused by temporary cavitation and shock waves.*" They observed further that "*Such cavitory injury is much more extensive than the track of the missile.*" And yet they made no mention of any large skull defects caused by these cavities, and no mention at all of defects distant from the passage of the bullet. While the wounds discussed in this article were apparently more survivable than Kennedy's, as these men all lived at least a half-hour after being shot, and 73 of the 80 men survived, the point is that they shouldn't have been, should Sturdivan's theories about the effects of cavitation on the skull have been accurate.

Having thereby dispensed with what supposedly happened, we can hereby commence discussing what actually happened.

Tom Bevel and Ross M. Gardner, Bloodstain Pattern Analysis with an Introduction to Crime Scene Reconstruction, 2008. "*Forward spatter patterns when present tend to be more symmetrical than back spatter patterns. This is probably due to the primary force of the impact being transmitted in the direction of the projectile. Back spatter patterns tend to be less defined...*" Note that they write "forward spatter patterns when present" and not "back spatter patterns when present". This confirms what we should already have expected--that back spatter is most always apparent, while forward spatter is not. This suggests--since only one massive spatter is visible on frame 313 of the Zapruder film--that the blood and brain visible is not solely forward spatter. That this explosion appears to be asymmetrical only adds to this probability. (Thanks to Sherry Gutierrez Fiester for bringing this argument to the attention of the research community.)

"*The cone of spatter is ejected generally perpendicular to a surface and does not specifically align with the bullet path.*" (This is demonstrated in a photo on the Blasts From the Present slide, above.) Well, there it is. Since the large explosion seems to rise from Kennedy's right temple at an angle perpendicular to the surface of the skull at this location, the upward and forward movement of the blood and brain matter at this location is just as suggestive of back spatter as forward spatter. Actually more...since there is only one massive spatter visible on the film, and back spatter is most always present, then we should conclude the bullet impacting at frame 313 of the Zapruder film did so at the supposed exit near Kennedy's temple, and NOT on the back of his head.

So this means the bullet killing Kennedy was fired from the front, right?

Well, not so fast...

6.5mm Military Rifle Wounds

6.5mm Military Rifle Wounds

Let's go back to the beginning and see if there's anything we've overlooked.

Fortunately, the wound ballistics of most every rifle known to man has been studied, and has been written up sometime somewhere. And so one bright day at UCLA I spent hour after hour combing through old Military Surgeon Magazines in search of a report, any report, on any World War II battle between the allied forces and Italy, in hopes of reading first-hand descriptions of Mannlicher-Carcano wounds. While I was unable to find such a study, I was able to find studies of wounds caused by similar rifles, and these helped convince me that the Clark Panel and HSCA's purported wound of entrance near the cowlick was far from the "typical entrance wound" they described in their report, and that the official explanation for Kennedy's large head wound was in fact incorrect.

Of particular help was a World War II report by Dr.s Ashley Oughterson, Harry Hull, Francis Sutherland, and Daniel Greiner on allied casualties in Bougainville, Fiji. This report was published in Wound Ballistics, by the Medical Department of the Army, and featured the autopsy protocols of more than one hundred soldiers. Many of these soldiers died after being shot by Japanese 6.5mm rifles. Other online articles I found revealed that these Japanese Arisaka rifles fired a bullet slightly smaller than the bullets fired by Oswald's Mannlicher-Carcano but that their bullets traveled slightly faster, imparting an

almost identical amount of energy into the wound. (The articles I found indicated the Arisaka bullet weighed 139 grains and traveled at 2395 fps and the Mannlicher-Carcano bullet weighed 160 grains and traveled at 2200 fps.) If any ballistics experts out there disagree with these numbers or with my assumption of a similarity between Arisaka and Carcano wound ballistics, please let me know.

The doctors summarized their findings regarding the effects of rifle ammunition on the head as follows:

"Head.—Head wounds produced by rifle fire were characterized without exception by extensive destruction of the brain and skull. Laceration, massive herniation, or total absence of large portions of the brain were the usual findings. Large areas of bony skull and scalp were frequently avulsed with shattering or widespread comminution of the residual portions of the skull. Ofttimes, bone fragments were driven deep into the brain tissue. Perforating skull wounds were more common than gutter wounds. Frequently, long, stellate fracture lines radiated across the base of the skull. Extensive damage was sometimes observed in one hemisphere of the brain, when the traversing missile track lay entirely in the opposite hemisphere. All these findings were interpreted as additional evidence in support of the modern hypotheses of wound production by high-velocity missiles.

Well, so far, so good. From this summary it sounds like the doctors would have claimed Kennedy's head wound was a typical wound.

Unfortunately, a closer inspection of the autopsy protocols proves this not to be the case.

The autopsy protocols of those dying from 6.5 mm bullet wounds to the head follow. These refer to the bullets as .25 caliber, which wasn't quite true. According to Bolt Action Rifles, by Fred de Haas and Wayne Zwohl, "much erroneous information circulated about that "small caliber Jap rifle" during WWII, with many believing its 6.5 mm bullets, which were .263 caliber, to be only .25 caliber. These protocols have been arranged in order of shot distance. For the sake of brevity, references to wounds other than head wounds have been removed.

- **Case 10:** A Fijian soldier, peering over the edge of an open foxhole to fire at the enemy, was struck by a .25 caliber Japanese bullet fired from a distance of **15 yards**. He was killed instantly at 1400 hours on 1 April 1944. Examination revealed a perforating wound of the head and multiple wounds of the extremities. The head wound of entry (**3.7 cm. in diameter**) was located at the inner canthus of the left eye and the exit wound (**8.7 cm. in diameter**) at the vertex of the skull. The skull was comminuted, and there was almost complete destruction of the left half of the brain.
- **Case 2:** A Fijian soldier, while on patrol, was standing behind a tree when he was struck by a .25 caliber Japanese bullet fired from a distance of **20 yards**. He was killed instantly on 31 March 1944. Examination revealed a perforating wound of the head. The entrance wound (**0.5 cm. in diameter**) was situated over the lateral border of the right supraorbital ridge and the exit wound (**1.2 cm. in diameter**) over the occipital bone. Stellate fractures of the frontal and occipital bones radiated from both perforations. The frontal and parietal lobes of the brain were perforated, and the cerebellum was grooved.
- **Case 11:** A soldier of the 129th Infantry was crouching and moving forward in a skirmish line when he was struck by a Japanese .25 caliber bullet fired from a distance of **20 yards**. He was killed instantly at 1300 hours on 24 March 1944. cursory examination revealed an extensive **gutter wound 15 x 10 cm.** involving the left temporal, occipital, and parietal regions. Large portions of these bones and underlying brain were absent. Extensive comminution of the remaining cranial vault was present.
- **Case 8:** A soldier of the 129th Infantry, 37th Division, was standing on his bunk in an open tent in battalion headquarters firing at the enemy, when he was struck by a .25 caliber Japanese bullet fired from a distance of **25 yards**. He was killed instantly at 0630 hours on 24 March

1944. Examination revealed a **gutter wound (5 x 2½ cm.)** of the left parietal region. Brain tissue exuded through the perforation in his helmet. Lacerated brain tissue, portions of the frontal and parietal lobes, was herniated through the wound. Marked subgaleal hemorrhage was present. The cranial vault was comminuted by stellate fractures. Both hemispheres of the brain were extensively lacerated. A mushroomed .25 caliber bullet was found in the right anterior fossa.

- **Case 20:** A soldier of the 129th Infantry was sitting on a log holding a flamethrower when he was struck in the head by a .25 caliber Japanese bullet fired from a distance of **75 yards**. His perforated helmet was found lying on the ground. He was killed instantly at 1130 hours on 27 March 1944. Examination revealed a **gutter wound 17.5 x 4 cm.** involving the right temporal and frontal regions. There were deep lacerations of the frontal, parietal, and temporal lobes. Disorganized brain tissue filled the wound. Extensive comminution of the cranial vault was found.
- **Case 25:** A soldier of the 129th Infantry was standing in an open foxhole when he was struck by a .25 caliber Japanese bullet fired by a sniper from a distance of **75 yards**. His helmet was perforated. He was wounded in action at 1430 hours on 24 March 1944 and died 5 hours later, despite shock therapy. Examination revealed a **gutter wound (15 x 7½ cm.)** occupying the right parieto-occipital region. Portions of these bones as well as the underlying cerebral hemisphere were absent. A small metal fragment was recovered from the remaining brain tissue and was identified as part of the jacket of a .25 caliber Japanese bullet. The right lateral ventricle was filled with blood. Petechial hemorrhages were present in the left half of the brain. Stellate fracture lines coursed through the bones of the vault.
- **Case 59:** A soldier of the 24th Infantry, while running forward in a skirmish line, was struck by .25 caliber Japanese machinegun bullets fired from a distance of **75 yards**. He was killed instantly at 1100 hours on 14 April 1944. Examination revealed multiple wounds. (One) bullet struck the left side of the face producing a **gutter wound 12.5 x 3.7 x 0.25 cm.**, which destroyed the left temporomandibular joint.
- **Case 17:** A soldier of the 129th Infantry, while walking up a jungle trail, was struck by a Japanese .25 caliber bullet fired from a distance of **100 yards**. He was killed instantly at 1320 hours on 24 March 1944. Examination revealed a perforating wound of the head. The wound of entrance (**2.5 cm. in diameter**) traversed the right infraorbital ridge; the exit wound (**3 cm. in diameter**) was located in the left parieto-occipital region. When the body was received, the helmet had not been removed and brain tissue was extruded over its surface.
- **Case 5:** A Fijian soldier, while on patrol, peered over a ridge and was struck in the head by a .25 caliber Japanese machine gun bullet fired from a distance of **150 yards**. He was killed instantly at 1000 hours on 26 March 1944. Examination revealed a **gutter wound (6.5 x 2.5 cm.)** in the center of the forehead with a portion of the frontal bone blown away. Fracture lines radiated through the temporal, parietal, and occipital bones. Both frontals and the right temporal lobes were lacerated. A bullet was recovered from the right temporal fossa.
- **Case 18:** A U.S. soldier was standing in a cleared area digging a foxhole when he was struck in the head by a .25 caliber bullet. The shot was fired by a Japanese sniper at a distance of over **150 yards**. The soldier was killed instantly at 1500 hours on 26 March 1944. Examination revealed a perforating wound of the head. The entrance wound (**0.6 cm. in diameter**) was posterior to the left mastoid process, and the exit wound (**1.2 cm. in diameter**) was at the outer canthus of the right eye. The bullet coursed in a superior and anterior direction and perforated the atlas; it then crossed the foramen magnum and severed the brain stem at the lower level of the pons. The track continued through the base of the skull, right ethmoid, and right orbit to the point of exit.

- **Case 19:** A U.S. soldier, while on duty as a sniper in the jungle, peered over a protecting log and was struck in the head by a .25 caliber bullet. The shot was fired by a Japanese sniper from an unknown distance. The soldier was killed instantly on 24 March 1944. cursory examination revealed a penetrating wound of the skull, with the wound of entrance in the left orbit. A compound comminuted fracture of the skull with marked brain destruction was present. (NOTE: while this entrance wound was not measured, it was photographed, and revealed to be many times the purported size of the entrance on the back of Kennedy's head.)
- **President Kennedy:** The President of the United States was shot while driving down the street in an open limousine. The shot was believed to have been fired from a distance of **90 yards**. The doctors at his autopsy claimed that a **1.5 x .6 cm** entrance wound was found low on the back of his head, and that a **13 cm** exit was found on the top of his head above his right temple. They also claimed that a large amount of skull was missing at the exit, and that the right side of his skull was largely fractured.

Notice anything? Surprisingly, 6 of the 11 bullets discussed in the autopsy protocols didn't leave easily distinguishable entrances and exits on the skull, but left large "gutter" or "tangential" type wounds of both entrance and exit. Even if one were to exclude the "gutter" wounds of cases 8, 20 and 25 under the assumption that the perforation of these soldier's helmets may have led to their creation, 3 of the 8 remaining bullets created "gutter" wounds.

The tendency of military rifle bullets to create such wounds was documented as far back as the 19th century, when full-metal jacketed bullets were first introduced. As an early example, 1916's *Gunshot Injuries*, by Louis Anatole La Garde, noted that gutter fractures were *"especially common with the use of steel-jacketed bullets"* and went so far as to say they were *"characteristic of jacketed bullet wounds."* The close identification of these wounds with jacketed ammunition eventually led Dr.s Sherman et al, of the L.A. County--USC Department of Neurosurgery, to note in a 1980 *Western Journal of Medicine* article on gunshot wounds to the brain involving civilian ammunition that *"Our experience did not reflect any tangential wounds to the head with the massive brain guttering and soft tissue loss as described in the military literature."*

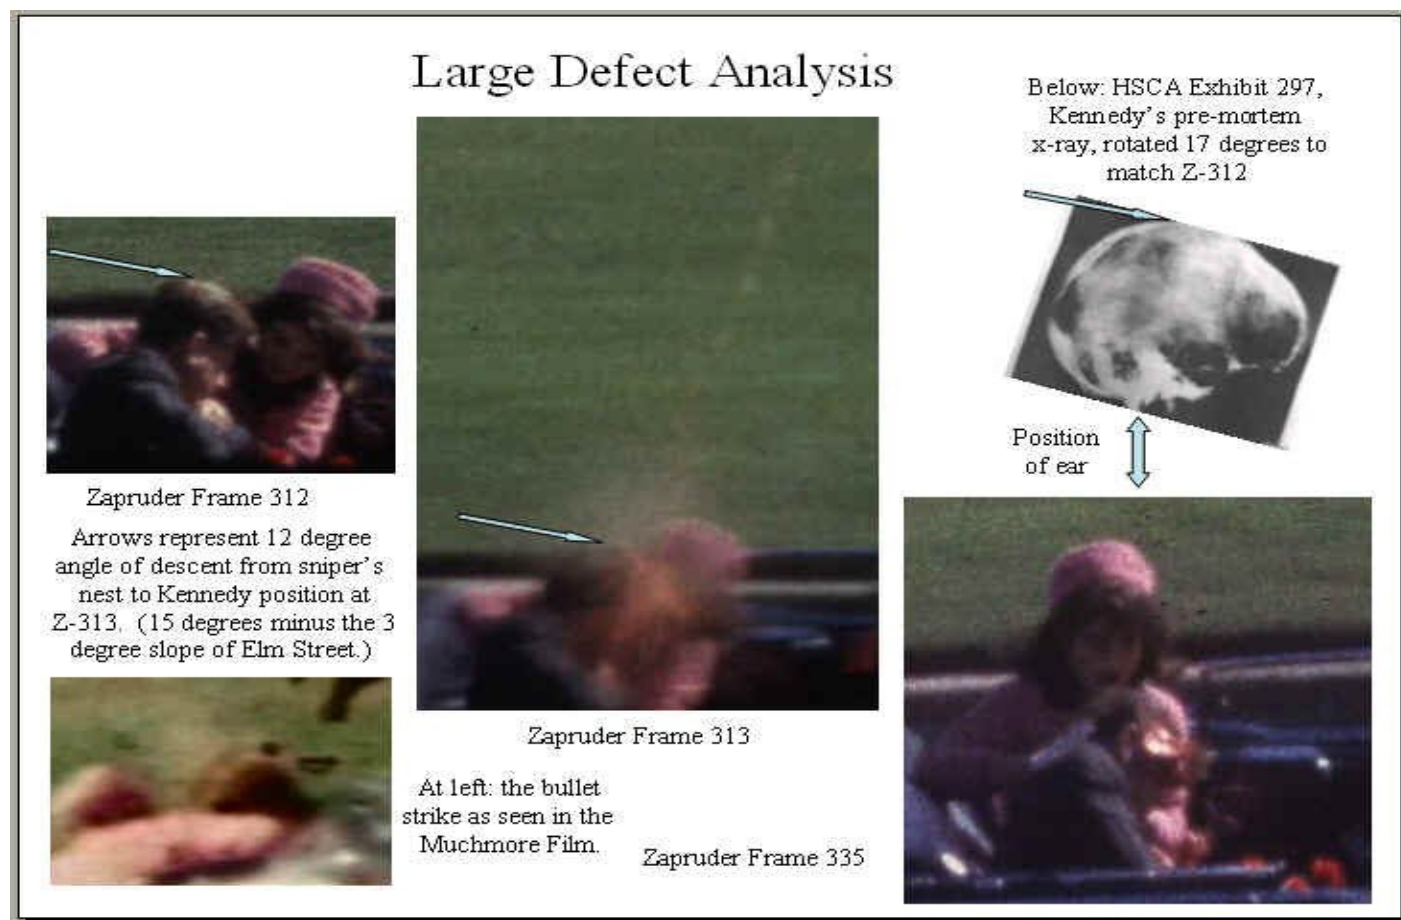

The comparative size of the defects was also unusual. If one excludes the three bullets first striking helmets, the entrance on Kennedy's skull was comparatively small, the third smallest of 8. While the exit in Kennedy's skull wasn't measured until the scalp was reflected and parts of his skull fell to the table, the autopsy photos taken before the measurements and the size of the skull fragments found outside the body reveal an exit of at least 5 x 10 cm stretching from the top of Kennedy's head to his temple. This proves that it, too, was unusual. It is, in fact, far larger than any non-gutter wound observed in the Bougainville Campaign, outside the one observed on Case 10, created by a rifle over 200 feet closer to its victim. As we don't know at what point in the autopsy the wound on Case 10 was measured, moreover, it remains quite possible that the 8.7 cm measurement for this wound was also taken after bone fell to the table. If so, then it too was much smaller than the 13 cm wound measured on Kennedy after his scalp had been reflected.
